THE BUILDERS'
JOURNAL
AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD WITH SURVEYING AND SANITARY SUPPLEMENTS

The City Art Gallery.

WE are pleased to be able to chronicle the fact that the Corporation of the City of London seems, by all reports, to show some inclination to possess an Art Gallery worthy of the Capital City. For every sign of genuine public interest in and knowledge of Art, may we be always sufficiently thankful; but it is a question whether this proposal is of such a nature. We have, of course, grown accustomed to see all public interest in Art lavished on painting. This is easily understood, and we are not exactly envious of our brothers the painters, for such popularity has its drawbacks, and we do not quite know whether to congratulate or to condole with them. Perhaps we ought to congratulate the painters and condole with painting. We may say, however, that an interest in Art which takes this form is not altogether a healthy one, but, perhaps, in an unnatural and conventional society it is its usual expression. We hope, and try to believe, that it is a step in the right direction, and that this growing interest may soon take more real and significant form. It has been remarked that, at those times when Art has flourished and been most in touch with life and manners, but little enthusiasm is shown for museums and picture galleries—for collections of works of Art or of works of archaeological interest; that when Art becomes divorced from life this interest grows up. Now, this is easily understood when we consider that in the golden ages when Art breathed an exhilarating atmosphere, the Artist possessing full scope for his energies and being stimulated to do his utmost, was more concerned to produce, to create, than to admire the productions of his predecessors. Those to whom he appealed, possessing his creations in their own homes and daily surroundings, feeling the influence of Art in the very clothing they wore, and the plates and dishes from which they ate, would have little inclination to form picture galleries; their own and their neighbours' houses would be pictures of superior interest. While for an appeal to higher emotions there was always the embodiment of the Unseen; the Pagan Temple, or the Christian Cathedral. In our own times it is evident that a man of culture and feeling, boxed up in a terrace-house or a flat in Victoria Street, deadened with the appalling vulgarity of his surroundings, would find relief for heart and brain at the British Museum or the National Gallery. But if Art entered more into daily life his surroundings would not be vulgar, and he would not need this relief. For the sake of such men, till we can get Art in our streets and houses, by all means let us have it in galleries and museums; but the existence of such institutions, with the striking contrast they afford between the mental atmosphere within and without, does not argue a high standard of public taste. We cannot think much of the intelligence of those who can tolerate, say, the present condition of Trafalgar Square, but who can yet gush over the pictures in the National Gallery. We do not think that the person who can walk to the Gallery through this Square, quite unaffected by its commonplace monotony, is at all capable, on his arrival inside, of really appreciating a Botticelli or a Velasquez. The pleasure of an hour spent in this Gallery is, to the Artist, only equalled by

the shock experienced on coming out again. For this reason we do not see much real advance in public taste in this proposal to enlarge the present collection of pictures at the Guildhall. We think a real enthusiasm for Art on the part of the City authorities would have rather shown itself in a desire to improve their City generally; as, for instance, Cheapside, the approach to their Gallery, whose ugliness is rendered more apparent by the charming spire of Bow Church, planted in its midst, like a flower in a dustbin. The more the Arts permeate life the less need will there be for picture galleries, or even for easel pictures, though we must not say this to the painters. Much as we like a picture gallery, we think a better work would be done by the City Corporation if it devoted its energies to removing some of the eyesores with which the City abounds; instead of providing a picture gallery for the display of works of Art, rather to make the City—as every city should be—a Work of Art in itself.

The Wallace Collection. Committee's Report.

THE Committee appointed to consider the housing of the Wallace Collection has, with one dissentient (Sir Edward Poynter), reported in favour of acquiring Hertford House and converting it into a museum with sundry alterations, the cost of which is estimated at about £90,000. What the necessary altera-

tions would be may be gathered from the following section of the report:—5. The evidence we have received goes to show that, were Hertford House made use of as a museum instead of for residential purposes, the amount of space available for the display of the collections could be further increased, and could be made amply sufficient for the purpose. It has been suggested to us that with this object the space on the ground floor to the north and west of the courtyard, now occupied by stables, coach-houses, &c., could be appropriated for new exhibition galleries. These would not have any top light, but could be well lit from both sides by windows opening into George Street, into Manchester Street, and into the central courtyard. They would largely increase the available space, and would be well suited for the exhibition of objects of Art of all kinds. Mr. Taylor, in his evidence, estimates that this alteration would increase the floor space available for exhibition purposes by about 7000 square feet, thus increasing the total available floor space from some 18,000 to some 25,000 square feet. It has also been suggested that the length of the picture galleries on the first floor could be increased by extending the skylights, thus converting the first floors of the eastern and western wings of the main building into exhibition galleries lit from above. This would involve the removal of those rooms on the second floor which are immediately above the rooms in question. It would be for consideration whether the armour should not be removed from the top-lighted galleries which it now occupies upon the first floor, its place

being taken by a part of the collection of pictures. We believe that the adoption of these suggestions, or some of them, together with minor alterations which we do not think it necessary to specify in detail, would enable the collection to be worthily exhibited, and would afford ample room for ordinary visitors, although it is possible that when the collection is first thrown open an exceptional number of visitors might be attracted, in which case special restrictions would have to be imposed for a time. Should it be thought necessary to provide means of egress other than those afforded by the main entrance in Manchester Square, additional exits could, without difficulty, be contrived on the eastern and western as well as the northern sides of the block occupied by the house and offices. The alternative suggestion, to house the Wallace collection in immediate proximity to the National Gallery, is rejected on the ground that the only available site, that at present occupied by Messrs. Hampton's business premises, could only be acquired after about five or six years' delay, and at a cost of between £300,000 and £350,000. The advantages of this plan, the Committee seem to think, are not so great as to justify the additional expenditure. The conclusion, therefore, is to acquire Hertford House. The signatories of this report are Lord Lansdowne, Sir William Harcourt, Sir Francis Mowatt, Mr. A. B. F. Mitford, Mr. Walter Armstrong, Mr. Alfred de Rothschild, and Mr. Alfred Waterhouse. Sir Edward Poynter, the President of the Royal Academy, however, pleads for the alternative suggestion: 3. But I think that the immense advantage to the public in having the two collections, each of which supplements the other in its weak points, in close proximity, is not sufficiently dwelt upon in the report. An opportunity is presented for making what would certainly be the most completely representative picture gallery in the world, affording unrivalled opportunities for study in every school of painting, and the whole forming a collection of unequalled magnificence which any nation would be proud to possess. This opportunity would be afforded by constructing a museum as suggested in Paragraph 11 of the Report, on the site to the west of the Trafalgar Square Galleries, at present

WITH THE A. A. GROUND PLAN OF BORWICK HALL.

occupied by Messrs. Hampton's and other premises. This scheme is, doubtless, far more costly than the proposed purchase and alterations of Hertford House; but it is quite certain that with the growing impatience of the public at the risk of injury by fire to the National Gallery, incurred by the immediate proximity of the furniture shops and warehouses, the expense of acquiring this site must sooner or later be incurred. The danger is a real one, and cannot be shirked. The expense therefore of building a museum for the Wallace collection on this site may be said to be that of providing the building, roughly estimated at

£125,000, as against £90,000, the estimated cost of purchasing and altering Hertford House. Hertford House, he points out, would have to be entirely rearranged, and would, therefore, not be Hertford House, as Sir Richard Wallace left it. We have already expressed our opinion that there is a great deal to be said for Sir Edward Poynter's proposal.

LORD DYSART has promised to subscribe £1000 towards the restoration of the Parish Church at Silk Willoughby, near Sleaford.

DRAWN BY J. HARRISON FOR THE ABBEY SQUARE SKETCH BOOK.

THE ARCHITECTURAL ASSOCIATION TOUR.

LANCASTER AND THE NEIGHBOURHOOD.

THE Architectural Association commenced its twenty-eighth annual excursion on Monday, the 9th inst. After so many years spent in the south, the Committee decided this year to visit a district entirely new to many of the members—"Time-honoured Lancaster." Few places can boast of such a history. Prominent in our annals, and closely connected with the Royal Houses of England, Lancaster formed the basis of many an expedition against the Scots in border warfare. In the history of the town the castle stands foremost, like a grim sentinel watching over the interests of the town, although in a different sense, it being now used as a prison. It is undoubtedly of Roman origin, a camp having existed

residence, Lancaster, now the centre of the wealth of the county, became noted for its Court splendours and the magnificence of its tournaments. The many changes which passed over the castle during the Wars of the Roses eventually caused it to fall into decay until the reign of Queen Elizabeth, when on the threatened invasion of England by Spain the castle was hastily repaired and fortified. And on the night of July 19th, 1598, from the keep shone forth the blaze of the beacon that announced the advent of the Spanish Armada. Readers of Harrison Ainsworth's "Lancashire Witches" will recall the great trial which took place in 1612, when ten out of the twenty witches tried were condemned to death.

In 1617 James I. passed a night here, journeying from Scotland to London, after having attempted to model the Scottish Church to the forms of English Episcopacy; and Charles II., passing through with his army on August 12th, 1651, just previous to the Battle of Worcester, ordered the release of the prisoners in the castle. The situation of the castle, as

and crowned on either side by watch turrets, belongs to the period of Henry VII. The niche above the outer arch, with the shields on either side, has the indication of having been inserted. The statue of John o' Gaunt was placed in the niche in 1822. The gateway was defended by a drawbridge over the moat—the chain holes may be seen in the outer archway—the bridge being raised and lowered by a windlass in the chamber above. Beneath the ground level are the dungeons, the roofs of which are of curious construction, being composed of concrete upon a framework of twigs or osiers, portions of which are still embedded, and may be picked out, though almost reduced to dust. The witches confined in these dungeons must have had a most inconvenient time, as they are completely dark and very badly ventilated. However, one does not expect witches to be accorded the best accommodation. St. Mary's Church, Lancaster, close to the castle, is built in the Perpendicular style, and contains some very handsome stalls. There are not many

THE A. A. TOUR. BORWICK HALL. DRAWN BY E. TURNER FOR THE JOHN O'GAUNT SKETCH BOOK.

here as early as 79 A.D. Little is known, however, of its history until the Norman Conquest, when the castle was bestowed by William the Conqueror on Roger de Poitou, who was the builder of the Norman Keep. The said Roger being banished for disloyalty, Stephen bestowed the earldom on his son William. Henry II. on his accession took Lancaster into his possession and eventually caused the castle to become a prison for malefactors. In 1199 Hubert de Burgh, Archbishop of Canterbury, besieged the castle, and in 1204 John received the French Ambassadors here. During his reign the moat was constructed round the castle, a portion of which remained until 1850, when it was filled up. John granted to the town its first charter, afterwards ratified by Edward III. After the unfortunate defeat of Edward II. at the Battle of Bannockburn, the Scots, in their victorious march southward, proceeded as far as Lancaster, burning the town and destroying the castle.

At the beginning of the fifteenth century, when Henry IV. used the castle as a royal

seen from the River Lune, is very imposing, and, if we recollect rightly, has formed more than one subject for the pencil of Turner.

We give a plan of the castle with the present issue. The entrance, with its two flanking towers and machicolated battlements, is probably, in its beautiful proportion, second to none in England, and forms a good study of the barbarous methods of warfare our ancestors adopted—pouring hot lead by the be-seiged upon the besiegers below seems to have been a pleasant little diversion of the garrison, judging by the many arrangements to be seen. King John was the builder of the gateway, and the low segmental arched head, splayed moulds, the nail head ornamented label and imposts, all belong to the early part of the thirteenth century, as also does the lower part of the gateway facing the courtyard. The outer archway, with its flanking, semi-octagonal towers, may be attributed to John o' Gaunt; the upper part, above the niche, with heavy projecting corbels supporting the battlements, pierced for the descent of missiles.

ancient examples of Architecture in Lancaster, but this deficiency is made up by the amount of excellent modern work, principally by Messrs. Austin and Paley, foremost among which we admire the Storey Institute, a stone building erected some few years since, the detail of which, almost Scotch in character, well repays close study. The Ripley Hospital Chapel, by the same Architects, is an admirable specimen of Decorated Gothic, the chancel has a stone groined ceiling in two bays divided by a clustered shaft on either side, the stonework between the ribs being relieved by bands of Runcorn stone. The external stonework for both dressing and walling is of Lancaster stone, and the internal ashlar throughout is of Stourton. The whole of this district contains specimens of the Church Architecture of this same firm, and it is difficult to find a village in which some of their work is not to be found. During our visit we had the pleasure of seeing "Longlands," whose hospitable owner—of stained glass fame—very kindly showed us round. The house is

of plain red brick, and is surrounded by a charmingly laid out garden.

At Morecambe, three miles from Lancaster, is the Church of St. Laurence, by Messrs. Paley and Austin, well worthy of a visit, and continuing the road through Morecambe we come to Heysham, a charming village overlooking the waters of Morecambe Bay. We have seen few Churches so picturesquely situated. It gives us an object lesson in plain village Church Architecture. Close to the Church is the old Hall, with its flat, typical gables, a truly delightful subject for the water-colourist.

In giving these brief notes on Lancaster and its immediate neighbourhood first, we have perhaps not adhered to the strict letter of the programme, for the tour commenced with Claughton Hall (pronounced Clupton), situated on the Kirby Lonsdale road, about six miles from Lancaster. On our way thither we noticed the aqueduct carrying the Lancaster Canal over the Lune, built by Stevens; and across the river on our left we see Halton Church. Claughton Hall is now very much gone to ruin. It is supposed to have been built by the Crofts—*temp.* James I. It has two high gables. The Church has a decorated east window, and a quaint bell cote containing one of the oldest bells in England. Continuing our route, we come to Hornby Church, some two miles further on. Evidence of the Church's very early origin is given by a huge Anglo-Saxon monolithic cross. Of the old Church little now remains, the nave having been rebuilt in 1889. The great feature of interest at Hornby is the castle, originally founded after the Conquest, now, unfortunately, much modernised. The interest of Hornby centres in its former famous owner, Sir Edward Stanley, of Flodden fame, who alone, of all its possessors, has left his mark behind him. The grand old keep bears his name on its base, with the motto, *Glav et gant*, and the Stanley badge, the eagle's claw.

After a ride of some five miles Thurland Castle is reached, situated in the broad valley of the Lune. The founders of the castle, the Tunstall family, had held lands in Lonsdale from the time of Henry II., and in the reign of Henry IV. they obtained license to fortify

HEYSHAM CHURCH. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

Sir Thomas Tunstall, to whom the license was granted, had fought in the French wars, and was present at Agincourt, and from him a century later the estate passed to Bryan Tunstall, the "stainless knight of Flodden" mentioned by Sir Walter Scott, when Surrey is describing to Marmion the disposition of the English forces before the memorable battle of Flodden. His son, Marmaduke Tunstall, took a leading part in the dissolution of the monasteries some twenty years later. The castle was in ruins until 1663, when it was partly restored by John Girdlington. From the Girdlington family it passed by sale to the Welch family, and from them to Miles North, whose descendant sold the castle and estates in 1881 to the present possessor, Colonel Lees. The castle is surrounded by a moat about

8ft. wide. The entrance on the west side is over a narrow bridge, immediately on the left of which are the remains of an old tower. The castle was further restored in 1812, 1827, 1889, and 1890. We cannot but reflect on the many valiant deeds of the former owners of Thurland and the knight who in the fifteenth century fought so bravely for the red rose of Lancaster; the "Stainless Warrior," whose name is closely associated with the fatal field of Flodden; and of the chivalrous knight, Sir John Girdlington, who fell in the battle of Melton Mowbray, fighting for the king.

Tunstall Church, a few minutes' walk from the castle, is supposed to be the second or third erection on this site—the effigy of the founder stands on the south side of the altar-rail. The Church will doubtless prove of

PARK HALL : LANCASHIRE :

WITH THE A. A. IN LANCASHIRE. FROM THE DRAWING BY J. HARRISON IN THE JOHN O'GAUNT SKETCH BOOK.

interest to readers of Jane Eyre, who will recognise the structure under the disguise of Brocklebury Church. Casterton, where she was at school, is in the neighbourhood.

From Tunstall, four miles further on, we reach Kirby Lonsdale, passing the "Devil's Bridge," the origin of which is unknown; it has existed, however, since before 1275. Kirby Lonsdale Church is largely of Norman origin; it was restored by the late E. G. Paley in 1865. From the north-east corner of the churchyard is a view described by Mr. Ruskin as "one of the loveliest in England, and therefore in the world."

Tuesday was devoted to a district the other side of Lancaster Sands; the four places visited, viz., Cark, Cartmel, Holker, and Grange, being within a radius of 3 miles. The district is now approached by train from Lancaster, but formerly a road existed across the sands some 11 miles long—the monks of Cartmel possessing the sole right of guiding travellers across; a dangerous journey, considering that at high water the sands are covered by 17ft. of water.

down owing to the fact that it was the Parish Church as well as the Church of the convent. The building then remained roofless for nearly eighty years. 1561 saw the rectory of Cartmel appropriated by the Crown and annexed to the See of Chester. In 1609 they were leased to the Preston family, owners of Holker, and have thus descended into the possession of the Devonshire family, the present owners. In 1830 the restoration was commenced, and has continued intermittently until recent years, principally under the late E. G. Paley.

The Church is cruciform, consisting of choir with side aisles or chapels, transepts, and nave with aisles. The exterior has a dignified aspect, the tower presenting a most striking feature, the only example of its kind in the kingdom, consisting "of a square placed on a square diagonally to its base." The lower portion just above the arches is the original structure, but at a later period it has been surmounted by a tower erected as a belfry. It is constructed by throwing pointed arches across the angles of the lower tower. The Church amongst other possessions has a large

panelled room, shown in one of our sketches, through which access is obtained to the staircase. On the first floor the front room to the left was formerly the domestic chapel, with a priests' room adjoining, from which there is said to be a trap-door and secret passage, though we could discover neither.

The square Peel tower, round which the other buildings group, appears to be of an earlier date than 1595. There are examples of similar Peel's at Arnside and Wraysholme. Ascending the staircase, at the top of which is carved the name of the mason, Alexander Brinsmead, and the date, 1595, we are on the leads, and a broad view of the magnificent country opens out on all sides—Ingleborough Peak to the N.E., and Warton Crag, with the picturesque Church nestling at its foot, whilst beyond is a long view of the Lancaster sands. King Charles II. visited Borwick in August, 1651, on his way to the Battle of Worcester, and it was in this historic Hall that they concealed Lord Clarendon whilst he was writing the history of the Rebellion.

The face of nearly all the external walls is

WITH THE A. A. IN LANCASHIRE.

Our first stoppage was at Cark, celebrated for its cockles. The Hall is a fair example of the old Manor House, and has belonged to the present owner by hereditary descent at least since the days of Queen Elizabeth. It has not been used as a residence since 1783, but has been kept unaltered in its present state as a farmhouse. In 1582 the Hall belonged to Thomas Pickering. The property passed to Robert Curwen, on whose death Cark was left to his nephew, Rawlinson, who was largely instrumental in the arrest of George Fox, the founder of the Quakers. The front of the Hall was erected in the beginning of the eighteenth century, the back portion being probably fifty years earlier.

Cartmel Priory, some two miles from Cark, was founded in 1188 by William Mareshal, Earl of Pembroke, and soon became a very large and important establishment. It was dissolved, however, in 1537, when the whole of the conventional buildings, with the exception of the Priory gateway, were demolished. The Church itself escaped being wholly pulled

parochial umbrella, like a carriage umbrella. The original use was doubtless to protect the minister at funerals.

Holker Hall is the seat of Victor Cavenish, M.P., the nephew of the Duke of Devonshire, and was the favourite residence of the late Duke. The present building was erected from the designs of Messrs. Austin and Paley, the previous building having been destroyed by fire.

Borwick Hall, the subject of three of our sketches, is situated about three miles from Carnforth. It was built by a rich weaver of Kendal, William Bindloss by name, in 1595. Passing by marriage into the Strickland family, it was purchased by the present owners.

Passing through the Gate House, dating from 1650, and forming part of a long range of farm buildings extending from the right wing of the house, we are in a sort of courtyard, and immediately to our left stands the Hall, raised on a terrace, with well-proportioned balustrade, the balusters spaced wide apart. The porch admits to a fine old

rendered with rough cast, which finishes in a line a few inches from the external angles and openings showing the stone joints.

(To be continued.)

Two blocks of handsomely-carved and traceried seating and a prayer desk, all in specially-selected English oak, have recently been fixed in the chancel of the Parish Church of Stoke Gabriel, Devon, for the Ecclesiastical Commissioners, from designs of Messrs. Christian, Caroe, and Purday. The work has been entrusted to Mr. W. Dart, Ecclesiastical Art Works, Crediton.

CHRIST CHURCH, North Brixton, is now an old building, and will not stand any further repairs, so it has been decided to rebuild it, and also to erect a parochial hall and infants' school, at a total cost of £17,300. Towards this sum £5400 has already been subscribed and invested, and about £2000 more has been promised. The foundation stone of the new Church was laid a few days since.

ART IN WALES.

IN no feature has the Welsh National Eisteddfod of the present year made such a marvellous stride as on the Art side. The exhibition of various forms of artistic production which is on view in one of the permanent market buildings at Newport, alongside the Eisteddfod building, is the symbol of a Renaissance of Welsh Art, brought up to date. The pictures and statuary are housed as well as the circumstances can reasonably admit. The results of the artistic uplifting of the Eisteddfod has had, at least, one result. It has "discovered" some half-dozen or more amateur Artists in Wales, who not only were not known before, but who, but for this scheme might not have had sufficient assurance to have ever sent in their works for exhibition. Now joining, as they should, some of the well-known Art societies of the Principality, they may easily come to the front. The South Wales Art Society or kindred institutions will, no doubt, give several of them the entry to further artistic channels. The Eisteddfod has in giving

ENCOURAGEMENT TO ARTISTIC WORK

done a distinctly useful work. To come to details, eisteddfodwyr and students and followers of Art will find their attention held by a striking water-colour painting of "Hwfa Mon," the arch-druid. It is the work of Professor Herkomer, and there are some experts who do not hesitate to say that it is the very finest thing the professor has ever done in water colour. On a background, happily suggestive of Welsh scenery, the arch-druid, clad as Herkomer himself desired, is shown emerging from a cromlech, and the fine, noble-looking figure is instinct and almost moving with the power and dignity with which the painter, as much as anyone, has invested the arch-druidical office. There is command in every line, and the very gesture of this power is almost conveyed. A critic of high status said that the picture alone is worth a pilgrimage to Newport from the remotest nook of Wales. Among the other exhibits of Professor Herkomer are four pewter pots and

CARTMEL CHURCH. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

the fulfilment of it by others brings its own ample reward. Visitors will be struck with the great allegory (No. 13), painted by Mr. Edgar H. Thomas, of Cardiff, which occupies a place of honour. It is a marvellous production, entitled "Intellectual Blindness following Old Thoughts." This clever Artist has never produced so strong and interesting a picture before, and it can only be regretted that he allows his talent at times to flow into misguided channels. For this picture there can be nothing but praise. It is strongly and truly painted, and we imagine that there is no work in the Exhibition that will take a higher place. Nos. 6 and 7, beautiful little paintings by P. F. Thomas, of Haverfordwest, entitled "Under the Lamp" and "Black and

Mr. Hagarty has done, and is sure to be much admired. The same Artist has several beautiful things in the Art Union section (for the drawings)—landscapes of different kinds, showing Nature in her varying moods, all produced with subtle effect. Probably the district has no finer exponent of landscape treatment. Miss E. Thatcher, of Newport, shows some very nice pictures. A pupil of the local School of Art, she has had hung a fine study of chrysanthemums (No. 27), painted from Nature at Belle Vue Park. Her "Fish and Game" (No. 26) is also a very strong production of still life. The Artist shows great cleverness in her treatment of details. "Snowdon," by Hamilton Marr, A.R.C.A., is a picture in which the distance is well dealt with, and sheep are

WITH THE A. A. IN LANCASHIRE. HOLKER HALL. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

four silver spoons, all executed by himself in *repoussé*, with a breadth of design and accuracy and delicacy of execution which command admiration. These specimens are brought to Newport by the Professor in order to show that

EVEN THESE SIMPLE OBJECTS

are worthy of the attention of the great master, and so to stimulate the youth of Wales to work upon implements and utensils of everyday use. It is a creditable desire, and

White," are charming. Mr. Parker Hagarty has a big work (No. 51), entitled "Woodlands," showing a forest scene, with the autumn colourings—one of his well-known subjects of bracken, beech, and birch trees—painted with great strength and feeling. Another of his (No. 82), "On the Road to St. Bride's, near Newport," is again a beautiful landscape, the scene being on the Wentloog Moors. The reens show strong, and ducks are cleverly painted, and a team of horses steaming on a summer day. This is one of the best that

very cleverly rendered, but the foreground to the right is rather commonplace and weak. Mr. G. F. Harris, of Merthyr, has a number of pictures which are very creditable. A small work in still life, showing tomatoes and a melon, is very clever. His "Usk Trout" is a painting which shows great promise. A very fine canvas is the "Babes in the Wood," by Mia A. Brown, *née* Mia Edwards, of Abergavenny, a pupil of Professor Herkomer. The wood scene in shadow, with glints of setting sunlight cleverly suggested through the trees, is finely

depicted. The figures of the babes are correctly drawn, and the daffodils in the foreground give a pleasant key-note to the harmony of the whole. The work of Mr. Christopher O. Williams, of Maesteg, in "The Hendre Farm," shows considerable strength and promise in a broadly painted landscape. Mr. W. D. Williams, of Maesteg, in his landscape shows a capital evening effect. There is great promise in it. A grand seascape is exhibited by Mr. W. J. Corah, of Mochdre, with much fine colour, depicting the surging billows dashing on the shore. In "The Cardiff School of Art" Mr. E. H. Thomas shows much executive power. It is a picture that will be sure to gain attention. His little work, "Approaching Winter on the Glamorgan Canal," however, is very different. It is almost impossible to believe that this work is by the same hand as the allegorical one previously noticed. The

BLACK OPAQUE SHADOWS AND REFLECTIONS are next to impossible in Nature. The picture is far beneath this acknowledged Welsh

"A Still Salt Pool Locked in with Bars of Sand," shows a picture that will be remembered, as it was exhibited at the Royal Academy, and also at the South Wales Art Society's Exhibition at Cardiff. Probably, there are few exponents of water-colours who can produce such

FINE EFFECTS WITH SHINGLE

and objects on the sea-shore as Mr. Cockran, who is one of the rising men amongst English water-colour Artists. Under the nom-de-plume "Sienna," one of the cleverest water-colours is shown, entitled "May Day." Mr. S. Towers, of Conway, shows in "A Welsh Hamlet" a most beautiful work. He depicts a country lane, with a cottage and brilliant garden flowers, and a figure with a milk-pail, carrying a child in arms. "The Nurse," by Mr. B. A. Pugh, of Aberystwith, will easily commend itself. "Idwal" shows two clever little portraits—viz., the Dean of Bangor and "The Parish Clerk." Amongst other Artists in the Art Union section, Miss

Riches has already taken a silver and a bronze medal at South Kensington, and bids fair to obtain a high position in the Artistic world if she continues her studies. In black and white there are some very clever works, notably one by Mr. B. A. Pugh, Aberystwith, entitled "For Joy or Sorrow." Photographs are well represented, some of the snap-shots being clever. A photograph of a child leaving her cot is exquisitely done. In poster work there are some fine and novel designs for colour printing, suitable more especially for the Eisteddfod. In needlework, the embroidered table-covers are very handsome, and some of the hand-made lace is also fine. An afternoon tea-cloth, embroidered with hand-made lace, is specially praiseworthy.

THE new Theatre Royal, Worthing, has just been opened. The theatre stands on the site of the old Assembly Rooms, the gift to the town of the late Sir Robert Loder. The building is admirably planned.

Artist's capacities. Mr. E. Prydderch, of Shrewsbury, shows in "Ruins of Theatre at Taormina and Mount Etna," a very carefully painted scene, the distance being particularly gorgeous. The details of the ruins in the foreground are most carefully depicted, though some of the figures are weak. The same Artist also shows "Glasgwmisaf," a fine water-colour picture. The effect of sunbeams shining upon and illuminating the valley is very choice. It is an excellent painting, with a deal of poetic feeling, and is sure to be one of the attractions of the Exhibition. "On the Edw," by Mr. Walter W. Goddard, of Swansea, is a very pretty landscape, suggestive of the Vale of Neath. "Summer," by Mr. A. Netherwood, of Llandudno, has some well rendered figures, haymaking. The horses are painted with considerable truth. The distance and colour also show some taste. Mr. G. Cockran, R.C.A., Anglesea, in the water-colour picture,

Ethel Woods, of Llandaff Place, Cardiff, has some roses, painted in her well-known charming manner. Miss Gwennie Griffiths, of Swansea, who has studied in Paris, shows very clever portraits. This young lady, we should say, is destined to take a high place in local Art. "Clovell Harbour," by Mr. J. M. Staniforth, is a beautiful little landscape sketch. Mr. J. G. Beetlestone, in addition to the picture of Rothesay Castle—one of Lord Bute's haunted houses—where the ghost is seen at the window in the evening shades, and which shows clever moonlight effects, the towers having

RECEIVED VERY SUBTLE TREATMENT,

has several very clever works at the Exhibition. Amongst the other studies, there is in sculpture an excellent representation by Miss Mabel Riches of her father, Mr. T. H. Riches, of Cardiff, in clay modelling. It is a clever portrait, and has excellent characteristics. Miss

Miss C. E. King recently laid the memorial stone of a new Conservative Club for Oxtou, situated in Village Road, Oxtou. Mr. Frank Holmes has designed the club, which is to be a two-story building, with bowling green attached.

THE Scottish Faculty of Actuaries has undertaken to fill one of the niches in the exterior of the Scottish National Portrait Gallery, at Edinburgh, with a statue of John Napier, the inventor of logarithms.

At Pwllheli there has just been added what is claimed to be the finest Art gallery in Wales. It is housed at the Glynweddw Hall, at the far end of the beach, which is reached by a newly-constructed marine tramway. The gallery contains over 400 paintings and drawings, and includes works by Turner, David Cox, Prout, P. de Wint, Stanfield, Muller, Copley Fielding, J. B. Pyne, J. Syer Nasmyth, S. Bough, D. Teniers, Cooper, and Elmore.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
August 11th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Government has had a record week of concession to Art. First, £80,000 for the pur-

fully indicated. In other words, the base will be a raised map of Guernsey. It is said, however, that the Victor Hugo cult, once so flourishing in France, is decaying.

ONE by one the old houses for which Aldersgate Street was formerly noted have disappeared, and the last of them, Lauderdale House, is now marked for demolition at an early date. It is not a beautiful structure; it can scarcely be called interesting except for its historical associations. It is a very plain brick building, in striking contrast with some of the handsome premises close by, and in its present condition is anything but suggestive of the fact that it was at one time the residence of a rich nobleman. In the seventeenth century, however, it was the town house of John Maitland, second earl of that name, afterwards created Marquis of March, Duke of Lauderdale, and Earl of Guildford, and K.G. The Duke had another house at Highgate, and one also at Ham; but when he acquired them, and whether having done so he abandoned his residence in the city, is not clear.

RAPID progress is being made with the work

museum will be well equipped. The alterations to this portion of the castle are somewhat extensive, but every precaution is being taken so as not to interfere with the grandeur of the old fort. The programme of alterations includes the remodelling of the gatehouse and the conversion of the guardroom and portcullis chamber into a museum.

THE gradual building up of a representative collection of British Art in the Louvre goes on steadily. One of the latest additions has been a portrait by Romney of Sir John Stanley, a fairly good example of the Artist. The money available for purchases for the Louvre is so limited in amount that important pictures can only be occasionally acquired, and the desire of the French Art authorities to secure a comprehensive gathering of the works of British masters cannot easily be gratified. Still, in spite of the many difficulties in the way, a fair number of pictures worthy of attention have been brought together, and canvases by Lawrence, Gainsborough, Bonington, Raeburn, Constable, and now Romney, represent agreeably enough the Art of this country.

FROM THE ORIGINAL DRAWING BY H. A. PALEY.

chase of Hertford House; next, a promise that the buildings adjoining the National Gallery shall be done away with; and lastly, a minute vote of £8000, wherewith to do something towards the preservation from fire of the South Kensington Museum.

VICTOR HUGO's statue, the unveiling of which is to be one of the events of the 1900 Universal Exhibition at Paris, is to be a somewhat sensational piece of work. The base of the statue, made of granite, will be shaped like the poet and novelist's place of exile for eighteen years, Guernsey. The coast line, the heights, courses of streams, &c., will be faith-

of erecting the memorial to the late Prince Henry of Battenburg, Governor of the Isle of Wight, at Carisbrooke Castle, by the conversion of the old gateway of the ancient fort into a museum for the reception of interesting objects connected with the island and with the history of the castle itself. Princess Henry of Battenburg, the Lady Governor of the island, is taking a keen interest in the work, and will, it is stated, within the next few days, visit the scene of operations, and make certain requests as to various portions of the work. It is hoped that during her brief stay in the Isle of Wight at this period of the year the work will be almost completed, and that before long the

SOUTH KENSINGTON comes in, from time to time, for a good many harsh criticisms at the hands of superior persons, but no one who visits its annual exhibitions of pupils' work year after year can fail to be impressed with the enormous good it is doing in encouraging the development of the practical side of Art in this country. In the Exhibition which opened at the Museum a few days ago, for instance, quite half the not inconsiderable space devoted to the display is taken up with exhibits of designs produced by the students suitable for utilisation in some branch of industry. Many of the designs for wall-papers and textile fabrics display real originality and a degree

of artistic feeling which would not have been considered possible a few years ago. The same remark applies to the designs for ornamental ironwork and for the more delicate forms of metal work embraced in the silversmiths and electro-platers' trades. But, perhaps, the feature of all others of the Exhibition which deserves notice is the display of designs for lace work. Some of these are exceedingly beautiful, and indicate a surprising degree of versatility on the part of those who executed them. While the Science and Art Department can show such results for its labours, it will stand in need of little defence.

As showing the extent of the operations of the Department, it may be mentioned that no fewer than 50,255 separate exhibits from 281 Schools of Art, were sent in, together with 35,560 exhibits from 298 science schools, and 11,796 exhibits from 449 art classes. Amongst the successful exhibitors 16 gold medals, 94 silver medals, 255 bronze medals, and 510 prize books were distributed, while in addition, 3 gold, 24 silver, 280 bronze medals, and 95 book prizes were awarded to students of the Royal College of Art.

The publication of the report of the Committee appointed to consider the question of housing the Wallace Collection, and the announcement that a supplementary vote of £80,000 has been asked for by the Government for the purchase and re-building of Hertford House, leave no doubt as to the course that is to be pursued with regard to this important addition to the national Art possessions. The decision of the Committee can, however, only be regarded as an unfortunate one, made with a very narrow appreciation of the exigencies of the position; and it is in the protest of Sir Edward Poynter, who at least takes a wide and judicious view of the question, that the proper solution of the difficulty that has arisen is to be found. The Committee seems to have been influenced by motives of false economy, and by an idea that the district of London north of Oxford Street is in need of a lounge where idlers may collect. Sir Edward, on the other hand, regards the Wallace Collection as educationally of the utmost value, and therefore asks that it should be placed where it will be most useful to students—in close proximity to the National Gallery itself.

WHAT must be most annoying to everyone who views the question of housing the national pictures with the foresight that is characteristic of Sir Edward Poynter, is the fact that, by this make-shift arrangement with regard to Hertford House, a great opportunity has been lost. Nothing more is likely to be done for some time to bring about a reasonable classification and grouping of our scattered collections, and the present unsatisfactory condition of the National Gallery must continue for an indefinite period. The only ray of hope which is given us is that by a pleasant coincidence Mr. Balfour has announced that the St. George's Barracks are to be removed as soon as the new barrack buildings at Millbank are completed. How long it will be before this desirable improvement is effected it is, of course, impossible to say, but at least there is consolation in this definite promise.

MR. THOMAS WRIGHTSON writes: "The attention of the public has been attracted to the disastrous collapse of the Embabeh Bridge over the Nile by a recently published report from Lord Cromer to Lord Salisbury, with notes from various Egyptian officials. Some years ago I went on two occasions for my firm of Head, Wrightson, and Co., to Egypt, to obtain particulars of bridges required over the Nile, and took great pains in making complete plans on which to tender in conformity with the general specification of the railway administration. I found on both occasions that, through there being no expert employed who could judge the relative merits of the designs submitted, the competition was an unfair one. At the time when tenders for the next bridge were invited I was in Parlia-

ment, and did all I could with the Foreign Office to get an alteration made in the system of taking tenders, but without effect. My firm, therefore, decided to retire from competition until the system of inviting tenders was altered. In order to put our decision on record, a letter was written, and we were joined in its signature by many of the largest bridge builders in the country. We might have been content to let the matter rest, even after the collapse of the Embabeh Bridge had entirely justified our attitude, but when British bridge builders are asked to amend their ways, to become more enterprising, and are in effect told that they do not understand their business, it appears to be high time that the reasons for their withdrawal from competition should be made public."

VISITORS to Ripon will no doubt remember besides the Minster, whose towers, "four square to all the winds of heaven," appear to dominate the city as the train approaches the station, the quaint little market-place, with its grey, time-worn obelisk. Around the uneven pebbly pavement of the square are ranged shops, inns, and official premises, and of the last the most conspicuous is a building with a pillared façade, and the legend upon it, "Except ye Lord keep ye cittie, ye wakeman waketh in vain." This is the Town Hall, and has served that purpose for many years, but, strangely enough, it has only just become the property of the city. The building was erected just about a hundred years ago by Mrs. Allanson, at that time the lady of Studley, and the official character then attributed to it is attested by the fact that the ceremony of laying the foundation-stone was performed by the Mayor. The frontage to the market-place measures 47ft., and the height of the building to the top of the pediment is 50ft. The interior is occupied for various purposes. Upstairs there is a banquetting chamber, 45ft. long and 24ft. wide, with a balcony and orchestra. A Council chamber, a suite of private rooms, and extensive cellarage are also included in the accommodation. Whilst the city has had the uninterrupted use of the building, it has, however, always been possible for the owners to bring the tenancy to an abrupt termination, and it is hardly a dignified position for any Corporation—least of all for that of a city of great antiquity—to find itself liable to be turned adrift at any moment and left without a civic habitation. In these circumstances Lord Ripon, the present owner of the property, decided at the close of his Mayoralty last year to make a free gift of the building to the citizens of Ripon. On Saturday week the gift was completed by the formal handing over of the deeds to the Mayor. The building itself, apart from the site, is roughly valued at £3000.

THE Committee of the Leicester School of Art, in its final report to the Corporation, states that for the year ending July, 1897, the successes were one gold medal, three silver medals, eleven bronze medals, and fourteen Queen's prizes. A scholarship, value £300, tenable at the Royal College of Art for four years, was gained by Arthur H. Baxter. In the personal examinations three lists have already arrived, which contain seventy-one first classes, sixteen second classes, two excellent, and two failures. The remaining results of the year's work, and amount of Government grant, are not to hand. In the national competition the school takes the third position in the kingdom, Birmingham being first, and South Kensington second. Notwithstanding that many of the large towns have during recent years provided themselves with new school buildings and appliances far in advance of those of Leicester, the school has so thoroughly maintained its high standard of work that not more than two or three towns in the country can show such a record of successes. The students have been awarded during the last nine years five gold medals, twenty-seven silver medals, seventy-five bronze medals, 111 Queen's prizes, and three scholarships to the Royal College of Art, of the total value of £900, have been gained by Leicester students, while the reports which

appear in the appendix, from the Science and Art Department, the Leicester School Board, and the Leicester County Council, bears independent testimony to the usefulness of the school. Drawing has been described as the mainspring of the technical education of the handicraftsman, and the influence of Art culture is being more and more exhibited in the production of every article of domestic manufacture and use. In this respect it has been shown that the superior art instruction of our Continental rivals has adversely affected our manufacturing industries. For it is felt more and more that it is the design which sells the article, whether it be of utility or luxury, and as there is an ever-increasing appreciation of tasteful commodities among the buyers, the preference will naturally be given to those manufacturers and craftsmen who can best combine beauty with utility in the productions which they offer. A great number of the students who have passed through this School have raised themselves into superior positions in all the important branches of industry in which skill, taste, and exact knowledge are necessary. Many have distinguished themselves as designers, lithographic artists, Architects, and leaders of industry, bringing trade and wealth to the whole community. But the results would undoubtedly have been much greater had better facilities been offered for the development of the artistic faculties of the people, which in Leicester, at least, have not been found wanting.

THE ninth annual meeting of the Society of Art Masters was held in the Lecture Theatre of the South Kensington Museum. The Chairman, Mr. S. J. Cartledge, in the course of his address, said that the events of the past twelve months had brought home to him the importance of the necessity of the existence of the Society. While rejoicing in its steady growth, he felt that its influence was not so powerful as it ought to be. It had done its best to bring its views to bear on the Education Department, but had not succeeded in making so strong an impression as other societies. The fact was that the Government was greatly influenced by public opinion, and unfortunately public opinion did not adequately understand the advantages of artistic training. The annual report stated that special attention had been paid to the scheme formulated by the Department of Science and Art for substituting attendance grants for grants on examination results. It had been represented that the regulations, although modified, would still be seriously detrimental to Schools of Art, and would retard the progress of Art education. The Council regretted that although a considerable time had elapsed since the Department signified its concurrence in the suggestion that some distinctive diploma or title should be accorded to Art Masters, this idea had not yet been carried into effect. As far as they could learn, it was proposed to confine the concession to those who had been trained in the Royal College of Art, thus shutting out many Art Masters of established reputation.

THE temporary bridge which the County Council is setting up midway between Lambeth and Vauxhall is now practically at a standstill. It has been carried out from both banks well towards the middle of the stream, where there is to be one single span of 160ft. in length. This is a modification of the original intention, and has necessitated some delay. The Thames Ironworks are, however, engaged in preparing the enormous girders for this central portion, and it is hoped that in three months or so they may be ready. Meanwhile plans are being prepared for the new Vauxhall Bridge, and two designs were exhibited in the County Council Chamber last week. It is sincerely to be hoped that the Council will tolerate nothing short of two really handsome bridges.

THE members of the Somersetshire Archaeological and Natural History Society are again holding their annual gathering at Bridgwater. Mr. Stanley, M.P., in his presidential address,

said there were several quarries near Quantock Lodge which were of an interesting character. He had the authority of so well-known a geologist as Sir Roderick Murchison in stating that the quarry of green stone of which Quantock Lodge was built was of very great interest. Most people who saw the house considered that it was built of green sandstone, but it was not so, for the stone used was a highly igneous rock which took a polish, and the party visiting Quantock Lodge on the next day would see a table of the polished stone. The late Rev. E. M. Lance had had some columns of the stone polished, with which he decorated the beautiful Church which was still being adorned and beautified. There was another large quarry near the Lodge, in which the stone alternated very largely, and it contained building stone, limestone which when burnt produced lime as well as polished marble. From this quarry a large chimney piece for Dunster Castle was carved for Mr. Luttrell. Another object of interest was a cave at Holwell, which had never been thoroughly explored. In addition there were a number of marble quarries to which a certain interest attached.

THE Royal Academy has now closed its doors, after a season which has been the reverse of prosperous. The sales have not been bad, in fact, more pictures were disposed of this year than last; but then, sales bring no profit to the Academy. It is from the shillings taken at the doors that the Academy's income is derived, and it is an open secret that the shillings of 1897 have been disastrously few. For this the fine, hot summer has been largely responsible, as the receipts at Burlington House are always greater in wet seasons than in dry. The Jubilee, again, proved anything but a blessing, and the generally unfavourable verdict passed upon the Exhibition doubtless kept many visitors away from the galleries.

SEVERAL important changes in the arrangement of the National Gallery have followed the removal to Millbank of works by English painters. The Spanish pictures have been transferred from their old quarters into the more spacious and better lighted gallery adjoining, which was formerly filled with examples of the French School. The former Spanish room is now devoted entirely to the paintings by German artists, which have been separated from those of the Flemish School. The position of honour in the German room has been assigned to the famous Holbein, "The Ambassador."

AN additional commentary on the skying of Mr. Brangwyn's "Venice" this year at the Academy is afforded by the news that the Bavarian Government has bought an important work by him for the Pinakothek at Munich. These constant expressions of the estimation in which the Artist is held abroad make more remarkable the treatment to which he is subjected in London exhibitions. Apparently he is condemned in this country to suffer the penalty which we reserve for all Artists of definite originality.

THE Exhibition of oil paintings by Professor Giovanni Lombardo, which is at present open at 21, Baker Street, is more interesting on account of the mastery shown by the Artist over intricacies of perspective than because he has any extraordinary manipulative power. He paints soundly, and draws with unusual accuracy, so that the Exhibition has a value of its own as a display of straightforward craftsmanship. The work which he has brought together includes both landscape and architectural subjects, and is not without variety. One of the most striking of the works on view is an interior of the Chapel Royal, Palermo, an impressive study of strong colour and redundant detail. All the subjects represented have been found in the island of Sicily.

MR. JOHN LEIGHTON writes: "In a recent issue of the Times a correspondent, 'J. R. T.', has proposed as a suitable memorial of the longest reign and the marine review that the

two domes of the Naval Hospital at Greenwich should be gilt in emulation of the glorious Cupola of Mansard at the Hotel des Invalides in Paris, a chapel that has been utilised as the place of sepulchre, in which the ashes of the Emperor Napoleon I. now rest. The work of Wren at Greenwich is certainly beautiful, but its office has been diverted from that of an asylum to a museum; and, moreover, it is not metropolitan. Now, why not decorate the dome of St. Paul's Cathedral, and make it as resplendent as the Kremlin at Moscow, for was it not the centre of the Diamond Jubilee attractions; and, moreover, does it not contain all that is mortal of Nelson, the martyr that made us master of the Mediterranean, and of Wellington, who at Waterloo brought peace to Europe and prosperity to England? Possibly £1000 might be well spent in obtaining a grand effect, but let it be done with British sovereigns, and let the gold be beaten by British hands, and neither more nor less be subscribed for by one person, who may say, Behold my golden offering, resplendent in the glory of the sun, to be the delight of millions! My offering is ready, and so is that of others I know. Here is a chance for the Lord Mayor to call a committee and head a list with a sovereign gold piece; and the thing is done."

THE International Exhibition at Stockholm is especially interesting this year. For the Art Department one cannot wander far from the Rörstrand stall of ceramic works. The decorative articles in Rörstrand faience are modelled and painted by an Artist who has introduced an entirely new style. The tone obtained by his method is exquisite, and the hand painting beautiful in both form and colour. Two lovely vases in palest green are decorated, one with thistles and the other with horse-chestnut leaves and fruit. Some bowls, urns, and vases in metal colour, produced by copper-oxide, are magnificent, but the method is a secret. The Danish porcelain perhaps still remains the finest. From their Royal Porcelain Works are shown two dinner services, and the "Heron Service," which was at the Copenhagen Exhibition in 1888, all painted by hand before being glazed. There is a large decorative plate in blue with white peacocks, and several with landscapes in blue tones. Also a large flower-pot in pale blue, with lions in pale grey tones, apparently walking round, is very attractive, and a flask in white, covered with a spider's web, is quite beautiful. The metal work is charming. The Swedish Company of Goldsmiths have some very fine exhibits in silver, but a good many of the designs are Danish. Some beautiful bracelets in gold have been copied from antique specimens dug up in Denmark. The most magnificent piece of Art is the large "mjod-horn" (mead horn) in silver, decked with runes, a Viking decorating the lid. From these horns the old Vikings always drank their sweet beer, which was called "mjod."

At one time the Highgate magistrates dispensed justice in licensed premises, the historic old Gate House. The Court was then transferred to the Northfield Hall, North Road, but this building is really nothing but a schoolroom; so a freehold site was purchased by the Middlesex County Council in the Archway Road, Highgate, for the purpose of securing a proper tribunal. The site includes an adjoining piece of land, upon which a police station is to be provided. The new building will be constructed so as to allow of two separate sittings of magistrates at the same time, the total cost being about £7500. The foundation stone was laid a few days ago.

THE loan collection at the Guildhall having closed, the galleries are again being hung with the permanent collection, which includes the gift of Sir John Gilbert and a very interesting group of his sketches in water-colour. These works will be opened to the public in the course of a few days. For next year, Mr. A. G. Temple, F.S.A., the indefatigable director of the gallery, is bringing together a collection of French Art of the eighteenth and nineteenth century, which should make one of the most instructive exhibitions the City Gallery has

yet held. By way of marking the importance of the just closed Jubilee Exhibition, Mr. Temple has written an account of "The Art of Painting in the Queen's Reign," in which he has something to say about the Artists as well as their Art.

A SECOND report from the Select Committee on Museums of the Science and Art Department has just been published as a Parliamentary paper. The members feel bound to confirm and emphasise the recommendation of their first report as to the necessity of immediate action to secure the buildings against fire, and to express their sense of the importance of completing the building on the east side of Exhibition Road, with a view to the safe deposit and satisfactory exhibition of the Art collections (including the Indian section now on the west side of the road in a hired building) at South Kensington.

IN its Parliamentary efforts this Session, the District Railway has had a rather remarkable success, and is about to push out in no less than three new extensions of its line. The most important, perhaps, is that which, under different circumstances, would have been a lateral extension of its road between Earl's Court and the Mansion House. As there was not scope for lateral extension it sought, and has obtained, Parliamentary powers to construct a second line by burrowing down underneath the first, the new system of tunnelling having rendered it easy and safe to do so. This new line is to extend from Earl's Court to the Mansion House, with one intermediate station, which will be either at Victoria or Charing Cross. It will be worked by electricity, the steam locomotives bringing in trains from the outside district giving place to electric engines at Earl's Court. This will keep the atmosphere in the tunnels free from pollution. Another extension for which the Company was fortunate enough to obtain Parliamentary sanction will be from Harrow to Uxbridge. A third project which Parliament has authorised, may prove to be in some respects even more important than either of the others, since it will connect Whitechapel with Bromley and the Tilbury and Southend. When this new connection has been made the transference will involve merely getting out of one train into another at Whitechapel.

MR. ERNEST CROFTS, who is to fill one of the spaces in the Royal Exchange, to the commission of the Mercers' Company, is a north countryman, who was born in Leeds some fifty years ago. After a short training in England Mr. Crofts went to Düsseldorf to study his Art. It is as a painter of military pictures that he has made his greatest success; but none achieved more popularity than his "Defence of Rorke's Drift," which was last exhibited at the Guildhall a few years ago. Of late, Waterloo has been a favourite subject with Mr. Crofts, and that is the theme of his picture now at the Academy.

THE Queen is the largest chimney owner in England, with the single exception of the Government. At Windsor Castle alone there are over 1500 chimneys. There are several hundred chimneys at Buckingham, Hampton Court, Kensington, and St. James's Palaces, while Osborne and Balmoral each provide a very considerable quota. The largest block of all is, however, at Windsor Castle. All these chimneys are numbered both above and below. There is a regular chimney map, with the whereabouts and the numbers of each carefully marked. In the older portions of the Castle the object seems to have been to conceal the chimneys from outward view as much as possible. The chimney-pots are therefore hidden away among the battlements. The battlements of the Round Tower are in many cases pierced by the chimney-pots. In other parts there are great stacks of chimneys, which rise to a considerable height. Some of the tops could be reached with ease by the veriest amateur. Many of the old chimneys are constructed on very complicated principles, with sharp bends and turns and curious obstacles.

Surveying and Sanitary SUPPLEMENT.

AUGUST 11TH, 1897.

HOUSE SANITATION AND DRAINAGE.

By E. CROPPER.

STRICTLY speaking, an article under such a heading ought to treat upon all matters of healthy house-building—the site, the situation, the orientation of the various rooms of the house, its ventilation, and its construction. But it is here proposed to deal only with the plumbing and drainage of the building, and of the principles which should regulate the planning of those parts of the house requiring such works. Effectiveness, simplicity, and economy should be the key-notes of all such works, and we propose first to deal with the principles that should guide the designer in arranging the various lavatories, baths, w.c.'s, and sinks inside the house, and the details of the drainage system outside. Plumbing fixtures arranged freely on every floor are, no doubt, a convenience, but they may become out of order, and in that case also dangerous, especially during hot weather; moreover, they are the most expensive details of house construction—therefore, a useless multiplication of these fixtures should be avoided. For instance, how often do we see in a middle-class house, accommodating, say, twelve persons, two w.c.'s on the ground floor, and one on the first floor, only a few yards distant from each other, and often so planned as to require separate soil pipe and drain, and that *bête-noir* of the Artist, the ventilating pipe that will crown each view. If the w.c. near the front entrance can be planned so that it does not dominate, in several senses, the small entrance hall, as well as the entrance elevation, and if it can be economically placed under that on the first floor, then its convenience has no drawbacks; otherwise it might often be omitted. Again, the pedestal w.c. is a very useful combination of the urinal, slop sink, and w.c., and the constant flushing it receives and consequent cleanliness, is far healthier than several fixtures, some of which may be seldom used, and which servants dislike to clean. In large houses it becomes a necessity to provide separate fixtures, and to duplicate them on each floor, but there are good reasons for exercising more restriction than is often shown in the supply of plumbing fixtures.

Fixtures should always be concentrated as much as possible, consistent with convenience, in compact groups and in vertical lines or tiers, so that the soil waste and ventilating pipes may be few. Small houses ought to be so arranged that the bath and lavatory may stand over the scullery or thereabouts, and, of course, adjoining the kitchen range, to allow the waste to discharge into the gully receiving the sink waste. The bath is then placed conveniently for receiving the hot and cold water supplies. In large houses this is not always practicable, but it is worth an effort to attain. The

cistern room should be placed over the bath room, if possible, so that the boiler of the kitchen range, the hot-water cylinder, and the supply cistern may be practically over each other. By concentrating the fixtures over the least ornate parts of the house, the cost of repairs, in case of burst pipes, is minimised.

Even in the smallest house the bath room should be kept separate from the w.c., each having a well-lighted and ventilated apartment; and a desire for concentration should never lead to placing a bath or lavatory in a bedroom; their waste pipes and traps are never entirely free of smell, especially where they run nearly horizontally; they should be placed in a separate dressing or toilet room adjoining, where, if well-ventilated, a pedestal or valve closet may be added to the other fixtures.

Water closets should not on any account be placed over reception rooms, nor if possible, next to bedrooms; but should be placed on the side of the bath room away from the sleeping rooms; a lighted and ventilated antepassage to the w.c. is useful in affording two doors to deaden the sound of the noisy cistern. To further make the w.c.'s sound-proof, the floor may be pugged. The walls should be of 9in. brickwork, and may be battened, and lathed and plastered; if they are framed partitions they should be filled in with cocoa fibre, and have a layer of thick inodorous felt, or better still, a layer of slag wool nailed on the fir framing and match boarding nailed through.

The difference between a well-arranged hot and cold water service and one badly arranged is, in England, that one stands a severe winter, and the other is frozen up by only a mild one. The position of the rooms having such services may aid either result, as, for instance, if the bath room is well protected from cold winds, and placed over the warm kitchen, it is much safer than over a larder on the north side of the house. The outside wall should face south, or as nearly so as possible. Service pipes also should be arranged to run on the internal walls; on no account should they be buried in plaster or brickwork. Often they might be left exposed on internal walls when the workmanship is good; but, where exposure is inadmissible, they should be fixed with lead tacks screwed to $\frac{3}{4}$ in. boards, and cased in with similar boarding, all fixed together with brass screws and cups for easy taking apart and replacing. On outside walls and in roofs the pipes should always be cased in, and wrapped with gaskin or pipe felting, or the casing stuffed with cocoa-nut fibre. Sawdust should be avoided, as it rots and swells.

Sometimes the supply cistern has to be placed in the roof, there being no separate cistern room accommodation. In this case it should be boxed in, the sides stuffed with fibre, and the lid made to fit tight, with turn-buckles to secure it.

It is well, too, to wrap the traps and waste pipes from baths and lavatories with felt or gaskin, and to see that all the openings round

these and soil pipes as they pass through the wall are made good and cemented round. All water-waste preventors should, if placed on outside walls, have a boarded protection next the wall, and the supply to the pan should have the same. All overflows from cisterns have, according to regulation, to discharge with open ends where the discharge may be seen. This is an excellent regulation, as it also forbids connection to any soil or waste pipe—often a strong temptation when it is difficult to reach the open air. The ends of the overflow pipes should have a hinged copper flap which closes the orifice against freezing draughts blowing up the pipe, but opens for any escape of water. It may be well to mention here that all overflows should be at least a $\frac{1}{4}$ in. larger in diameter than the service supplying the cistern.

As a general rule, soil and waste pipes should be taken outside as direct as possible. If, however, one of these receives several branches from a tier of closets or lavatories, it is more convenient to run it down an angle or chase internally, to shorten the lengths of the branches. The joints should be carefully made, and the junctions made oblique to the soil pipe not at right angles. The ventilating pipe from the top of the soil or waste pipe should be carried outside at once.

Soil pipes serving two closets should be 3in. diameter; for three or more, $3\frac{1}{2}$ in. to 4in. diameter. They are usually of lead equal to 8lb. to the superficial foot; or of heavy cast-iron in 6ft. lengths, painted with Dr. Angus Smith's solution, or treated with the Bower-Barff anti-corroding process to preserve the iron. Where the pipe is exposed to the atmosphere, there is no doubt that lead is the best material. The tacks for securing the lead soil pipes to the wall should be in pairs, each strongly soldered to the pipe, made in length twice and in width the same as the drain of the pipe. They may be cut and shaped in various ways, and should have two $\frac{1}{4}$ in. large-headed nails to each tack. The best joint in lead pipes, adding much to the strength, is the wiped soldered joint.

All soil and waste pipes should, if possible, be so fixed that a current of fresh air may be circulating through them. For this purpose both ends should be open, the foot of the waste pipe under the gully grating, and the soil pipe, with its length of drain untrapped, at the inspection chamber. The head of the pipes should be continued up full bore above the eaves to a height of 3ft. or more, and finished with a pneumatic exhaust ventilator slipped over the end of the pipe, and the joint made in red lead. Instead, galvanised iron or copper wire balloons, or hoods of iron or lead, are fixed on the ventilating pipes, but these do not induce a current up the pipes. Should openings, such as windows or dormers, occur within 8ft. of the ventilating pipe, it should be carried up above the heads of these at least 3ft. Sometimes it is necessary to carry it up the roof to the ridge, but this is the last resort. On no account, however,

should it run up the chimney stack, or the foul air will almost certainly be drawn into the house. The terminations of ventilating pipes deserve very careful consideration—more than is often given to them.

It is important, when a tier of two or more closets or lavatories empty into the same pipe, that precaution be taken to prevent syphonage of the traps to the lower basins when the upper basins are discharged. The down-rush of water drives the air before it, leaving a vacuum behind; the air in the branches on the way down is sucked out, and the atmospheric pressure on the house side of the trap of each branch forces the water out, leaving a clear way for the foul air to pour into the house. To prevent this, a 2in. pipe should be taken from the outgo of the lowest trap, up above the topmost trap, and connected to the ventilating pipe, receiving branches from all the outgoes in its course. This forms an air supply to the branches, and preserves equilibrium in the traps.

Waste pipes from lavatories or scullery sinks should not be connected to soil pipes, but discharge with an open end under the perforated grating of a trapped gully, this in its turn being connected to the drain from the soil pipe, or carried separately to the inspection chamber.

Sometimes one sees soil pipes treated in the same way, discharging with open ends into a Hellyer's trapped interceptor, and, where the drain from it is an old one, or of great length, it is advisable to use this interceptor, which traps off the drain and allows fresh air to enter at the foot of the soil pipe and pass up to the top; but if the drain is of short length, and ventilation can be obtained through the inspection chamber, it is better to avoid traps, which only interfere with the head of the discharged sewage and block up one end of the drain.

The patterns of closets are legion, and improvements are continually being made in them, but they are practically divided into three classes: the valve, the wash-down, and the wash-out closets. Very few of the last-named are now made compared with the others, though they find favour in some quarters. It is generally admitted, however, that the closets of the first two classes are the best. The valve closet is the more costly, but no doubt it is the most perfect, and those made by Underhay and Hellyer are probably as near perfection as any obtainable. These have enclosed seats, which are still preferred by many, from sentimental reasons apparently. The seat may be hinged to lift up, so that the closet may be used as a urinal. Of the wash-out closet there are many patterns, such as Doulton's Simplicitas, Twyford's Deluge, Unitas, and Twycliffe patterns. These have no framing except a hinged-shaped seat, to lift up when necessary for emptying slops, &c. This seat may also have a hinged-shaped lid covering the holed seat. The seats are best in two thicknesses of hard wood, the grain of one crossing the other to prevent splitting. The underside of the holed seat should be fitted with three india-rubber buffers, and rest by these on the iron brackets supporting it without touching the closet pan.

The satisfactory connection of the P or S trap of the closet has only of late years been contrived, but this is now possible with Twyford's "bayonet joint," and Doulton's screwed rings.

The water supply to valve closets should, if allowed by the water company, be by a valve and regulator, worked from the handle of the closet. This method, however, allows a supply so long as the handle is held up, and may use more than two or three gallons—the limits of some water companies—in which case waste-preventor cisterns must be used. There are many of these cisterns claiming to be noiseless and certain in their actions, but the best seem to be Shanks' "Reliable," and Doulton's "Paisley" cisterns.

Service pipes from the main cistern, or from the main supply of the building, where the supply is constant, to water-waste preventors should be ½in. lead, with brass unions and ball valve of same size; and the supply from the cistern to the closet pan 1½in. lead where the

cistern is 7ft. above it, if more than 7ft., 1½in. supply will serve. The joint with the pan is made with an indiarubber cone slipped over the pipe and the arm of the closet rim, and tied to both with strong copper wire. The supply pipe to valve closets should be of the same diameter until the height of cistern above face is 20ft., when 1in. valve and 1in. supply pipe is sufficient.

Some water companies restrict the size of water waste preventors to a two-gallon flush, but if possible the three-gallon cistern should always be supplied, even though the water be paid for by meter.

It is convenient when repairs are needed to plumbing fixtures, or in case of frost, to be able to cut off the water supply to each without stopping the use of the others, and stop-taps should be arranged where they can be easily found or seen on the various services. It is perhaps not advisable to provide too many, but they are often very serviceable.

Urinal fittings need some mention. It is, if anything, more desirable that the space in which these are placed, and the fittings themselves, should be better ventilated than water-closets. The best fittings are those of white glazed enamelled stone ware, with traps, and gutters if any, of the same material. The more lead is substituted by the stoneware the better, as lead traps and wastes eventually become coated, however well flushed they may be. The urinals may be arranged with basins placed singly or in stalls with slate enamelled stoneware backs and divisions, or in stalls without basins, as made by Jennings, Adams, Twyford, and most makers. The flushing may take place as for closets, with a one-gallon cistern to each basin or stall, or a three-gallon cistern to serve four or five; or the flushing may be done from a similar cistern, flushing automatically every quarter-hour or more; this, however, is usual only in public conveniences. It is well, too, to have a ½in. bib tap placed in the same room, having a screwed union connection for Royle's patent nozzle and hose to wash the fixture and floor each day, the floor being laid to fall to the urinal gutter to throw off the water.

The materials used in the walls and floors of bath rooms, w.c.'s, and urinals should have the primary qualities of being impervious to water or odours, light in colour, and easily cleansed. The walls may be of glazed enamelled bricks of every shade of colour, salt glazed, double dipped bricks having a dark brown tint, useful for skirtings, and having a surface which is really part of the body of the brick, so that it cannot chip off. An excellent and beautiful material called Opaline has been invented, which can be placed in the form of sheets ½in. thick on ordinary walls, or screwed to wood battens or wood partitions. It is well suited for dados of w.c.'s or bath rooms, with plaster walls above finished with four coats of enamel paint; and this treatment has the advantage of being applicable to ordinary brickwork after the pipes and fixtures have been fixed. Floors of all such rooms should be waterproof, or nearly so. Glazed tiles or quarry tiles on breeze concrete, with strips of cork matting where necessary, make the best floors; sometimes lead is laid over wood floors, especially under the closets, to form a tray, but wood floors should be avoided if possible. It is always possible in new buildings to lay the joists an inch lower than usual for floor-boards; fill in with fine breeze concrete as if for pugging, and float smooth for tiling, which then finishes level with the boarded floor adjoining.

(To be continued.)

MR. JAMES LEWIS THOMAS, F.S.A., late chief surveyor of the War Office, has been elected an honorary associate of the Royal Institute of British Architects.

THE Croydon County Council is about to apply to the Local Government Board for sanction to borrow the sum of £72,000 for street improvements and new waterworks.

THE building erected by the Scarborough Model Lodging-House Company (Limited), in William Street, "to provide healthy and comfortable lodgings for the industrial classes," has just been completed at a cost of £2500.

Surveying and Sanitary Notes.

DR. J. F. J. SYKES, Medical Officer of Health for St. Pancras, in a report which he has just presented to the Vestry, states that of the 25,000 dwelling-houses in St. Pancras alone, he estimates that probably not one-tenth are supplied with baths. While he recognises that it is hopeless to expect the provision, at the public expense, of single baths for the remaining 22,500 houses, he considers the Public Health Committee might, in the absence of legislation, usefully urge upon house-owners the ultimate advantage they would be likely to gain by supplying their tenants with proper bathing and washing accommodation. In all new neighbourhoods even the smallest and cheapest houses have, he says, baths and coppers.

THE extension to London of the railway system which until recently was known as the Manchester, Sheffield, and Lincolnshire Railway, but will henceforth bear the name of the Great Central Railway, is making satisfactory progress towards completion. The London section of the line, which has changed the aspect of St. John's Wood and swept away insanitary areas in the region of Lisson Grove, Marylebone, is being pushed on rapidly. Both the passenger and goods terminal stations are in the parish of Marylebone, the former of which, faced in Marylebone Road by the Grand Central Hotel, will have two long arrival and departure platforms. Down the centre of each there is to be a cab-rank. Instead of one large glass and iron span covering the terminus, the roof will be built in short arches. The Grand Central Hotel, now in course of completion, will have a frontage of 200ft. and a depth of 315ft. The hotel is to have a courtyard after the Continental fashion. The terminal buildings also include a goods warehouse and coal depot. Having regard to the district now served by the railway and its possession of the port of Grimsby, a huge traffic in coal and fish is confidently anticipated. The goods warehouse will be five stories high, 380ft. long, and 270ft. wide. The coal depot will occupy a site formerly covered with slum property; and, in accordance with statutory obligation, the Company have erected blocks of industrial dwellings, presumably for the accommodation of the population displaced, an illustration of which we gave a short time since. The Architect of these dwellings was Mr. Alex. Stenning.

FIFTY years ago the Water Committee of the Liverpool Corporation purchased the undertakings of the private companies who had hitherto furnished the water supply for the city, so that the present year brings the jubilee of the corporate committee. On Wednesday the Water Committee engaged in its annual inspection of the pumping-stations at Aubrey Street, Green Lane, Prescott, and Dudlow Lane (Wavertree). The Aubrey Street pumping station was the first place visited. It was constructed in the year 1857 for the purpose of supplying Rivington water to districts that could not be supplied by gravitation from the reservoir at Prescott, and to give a high pressure supply for the extinction of fires. There is a tank which holds 250,000 gallons, and is supported on strong masonry columns and arches, forming a familiar and striking architectural feature in Everton. On the suggestion of the water engineer, and in order to cope with the distribution of Vyrnwy water, a new pumping engine was ordered from Hathorn, Davey, and Co., of Leeds. It is a three cylinder triple expansion vertical rotating engine, with cylinders of the following dimensions: 15in. high pressure, 23in. intermediate and low pressure, 38in. diameter, and 3ft. stroke. It can be driven at various rates of speed to suit the varying demands for water, and there is also an arrangement by which it can be controlled by the rise and fall of the water in the high-level tank. The expenditure has been £5640.

THE Eastbourne Waterworks Company has spared no effort in its endeavour to fulfil its pledge before the Parliamentary Committee, and to place Eastbourne in possession of the auxiliary supply of water from the works at Friston at the earliest possible moment. The laying of the new pumping main from Friston to the high service reservoir at Meads has been practically completed, and the additional service has been formally inaugurated by the Duke of Devonshire, accompanied by the Mayor and Corporation. It is barely nine weeks since

the contract for laying the main was placed with Messrs. Aird and Sons, and the expeditious manner in which it has been prosecuted is highly creditable to all concerned. Necessarily some of the work is of a temporary character, the new water supply, however, being a permanent addition to that already derived from Holywell, Wannock, and Bedford Well. The new main, which extends over a length of nearly 3½ miles, and crosses Mr. Carey's land at Eastdean, and Black Robin Farm, traverses very uneven ground, and considerable tunnel-

ling will be required before the main is completed in a permanent form. This, however, may be accomplished more leisurely. This work will be carried out by Mr. William Wallis, and it is expected may be finished by about Christmas. The Company is also engaged at Charleston Valley, where it is expected that a still greater supply of water will in due course be available, and which will augment the supply from Friston. The quantity at present derivable is estimated at between 700,000 and 800,000 gallons daily.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Aug. 13	Flushing, Falmouth—Re-seating, &c. Wesleyan Chapel	Admiralty Commissioners	H. W. Collins, Architect, Penryn-street, Redruth.
" 13	Scarborough—Dwelling-houses (8)		Director of Works Department, 21, Craven-st., London, W.C.
" 14	Clones, Ireland—Church Repairs		W. Hague, 50, Dawson-street, Dublin.
" 14	Carlisle—House and Cottage		C. Armstrong, 45, Lowther-street, Carlisle.
" 14	Carmkirk, Cornwall—School, &c.	Illogan School Board	S. Hill, Architect, Green-lane, Redruth.
" 14	Deerhurst, Tewkesbury—Flood-gate Door, &c.		S. J. Gillett, Surveyor, Deerhurst.
" 16	Ballyhaise, Ireland—Two Cottages	Great Northern Railway Co., Ireland	Company's Engineer-in-Chief, Amiens-street, Dublin.
" 16	Cockermouth—Tool-house in Park	Urban District Council	Surveyor, Council Offices, Cockermouth.
" 17	Chelmsford—Engine House	Town Council	Borough Surveyor's Office, 14, Museum-street, Chelmsford.
" 18	Hackney—Movable Floor over Bath	Union	T. R. Coles, Clerk's Office, Homerton, N.E.
" 18	Pontypool—Alterations to Workhouse, Hospital, &c.	Guardians	Lansdown and Griggs, Metropolitan Bank-chambers, Newport, Mon.
" 20	Carlow, Ireland—Additions, &c., to Asylum	Commissioners	Board of Control of Lunatic Asylums, Custom House, Dublin.
" 23	Redruth—Two Semi-detached Villas	R. Dunn	H. W. Collins, Architect, Penryn-street, Redruth.
" 24	Everton—Chimney Shaft to Refuse Destructor	Corporation	City Engineer's Office, Municipal-buildings, Liverpool.
" 24	Durham—Chapel Enlargement		W. R. Woodhead, Trimdon Grange.
" 26	Kingston-on-Thames—Extension of Electric Light Buildings	Corporation	Borough Surveyor, Clattern House, Kingston.
" 28	Cardiff—Truant Industrial School	School Board	W. H. D. Caple, 1, St. John's-square, Cardiff.

THE NEW GOVERNMENT OFFICES.

REPORT OF THE COMMITTEE.

IN March last, in view of the approaching reappointment of the Select Committee which were directed to consider the manner in which the sites available for the erection of the new buildings required for Government offices might best be appropriated for the purpose, we published an illustrated article based upon the interim report made by the Committee in 1896, and the evidence then taken, and explanatory of some of the material points that remained over for consideration this year. The Committee were duly re-appointed on March 25th, among its members being Mr. Smith-Barry, Mr. J. Burns (the Chairman of the Executive), Sir C. Dilke, Mr. Disraeli, Mr. Akers-Douglas (First Commissioner of Works), Sir S. Northcote, and Mr. Legh; and it held several sittings to take further evidence upon the plans laid before the Committee last year. Of these there were three, the point of differentiation as between them being as regards the exact situation of the frontage eastwards of the Government buildings proposed to be erected on the Great George Street or Parliament Street site. We now reproduce, as an aid to the reader, the key plan we published in March, showing the lines of frontage proposed in the three plans in question.

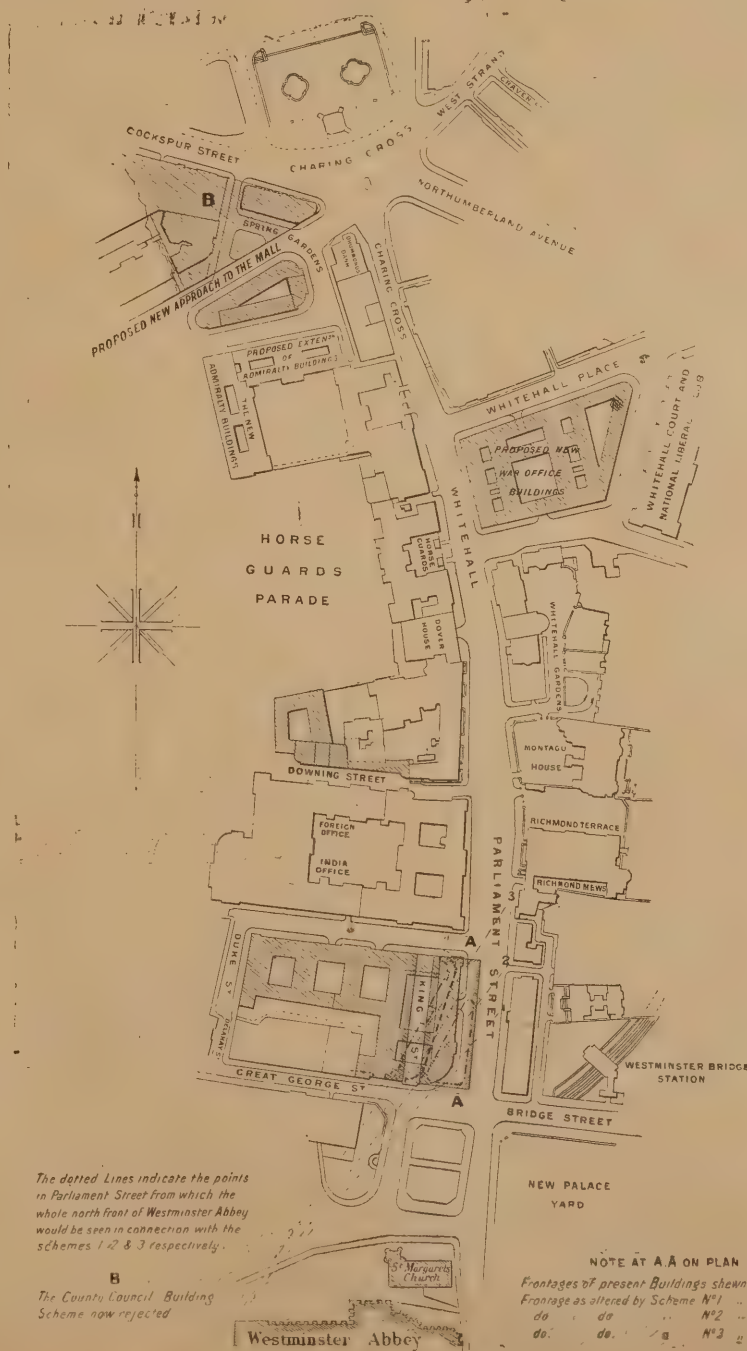

The Committee now state that, having regard to certain criticisms made from an architectural point of view upon those plans, they thought it well to examine representatives of the Council of the Royal Institute of British Architects, and other qualified members of the Profession; and the witnesses so examined include Mr. Macvicar Anderson, Mr. Waterhouse, R.A., Professor George Aitchison, A.R.A., the Right Hon. G. Shaw Lefevre, Mr. J. Oldred Scott, F.S.A., Mr. H. Heathcote Statham, and Mr. R. W. Edis, F.S.A., and Sir John Taylor, R.C.B., principal surveyor to the Office of Works. Various alternative plans were submitted by members of the Profession, "but," the Committee go on to say, "whilst we have availed ourselves of some of their suggestions, we have felt unable, owing partly to the enormous cost involved, and partly to other considerations, to recommend their schemes generally for acceptance. Upon a review of the whole evidence we have arrived at the following conclusions: We are of opinion that the new public offices on the 'Parliament Street' or 'Great George Street' site should be erected mainly on the lines of plan No. 1 in the appendix to the report of last year, with a frontage in a line with the frontage of the Home Office, and parallel to the east side of Parliament Street; but we recommend that the south-eastern corner of the new building should be square and not rounded. The land between this new frontage, and the present west side of Parliament Street, would, if this plan were adopted, become part of the public street; and in our opinion there is no need to make special provision for separating the traffic at this point." There is an expression of opinion by the Committee which will, no doubt, have due weight; it is that "in view of the great Metropolitan improvement to be carried out at Parliament Street, at the cost of the Government, the London County Council should be requested to consider whether they should not put into operation the powers possessed by them under the Public Offices (Westminster) Site Act of 1896, and contribute a share of the total value of the land, which, under this scheme, would become part of the public street." Following the suggestion made to them by Sir John Taylor last year, the Committee recommend the appropriation of this site for the Board of Trade, the Education Department, and the extension of the Local Government Board.

As regards the Whitehall or Carrington House site, having considered the alternative schemes for the War Office which have been placed before them this year, the Committee adhere to the recommendation made in their interim report, being satisfied that a building satisfactory in appearance and accommodation can be erected on that site within its present

boundary lines; and they are of opinion that the details as to the arrangements of buildings, courts, &c., should be entrusted to the discretion of the Office of Works in conjunction with the Architect selected. They think that a subway should ultimately be formed under the street between the War Office and the Admiralty. The Bill for acquiring the contingent interests in this site has already received Royal assent, and payment of the money required may, in the discretion of the Treasury, be spread over a long term of years. Schemes were submitted to the Committee by the Royal Institute of British Architects and by Colonel Edis, for a widening of Charing Cross and of the northern part of Whitehall, but the Committee came to the conclusion that they could not recommend that the taxpayers should be asked to bear the cost of this Metropolitan improvement, which, if undertaken, comes more properly within the duty of the local authorities. They, however, strongly advise that the Mall should be opened into Charing Cross on the north side of Messrs. Drummond's bank (see plan). They did not contemplate the passage of any other than light traffic through the Mall, and were satisfied that the skill and experience of the police would supply satisfactory means of overcoming any difficulties of traffic which might to some

extent follow such opening. They were of opinion that no decision should be arrived at as to building on the triangular site in Spring Gardens until the houses standing there have been removed, and the ultimate requirements of the Admiralty considered. Finally, the Committee say:—

"We recommend that Nos. 11 and 12, Downing Street, occupied respectively as a residence for the Chancellor of the Exchequer and as an office for the Patronage Secretary to the Treasury, should be removed, as unworthy of the site they occupy; but we are of opinion that the principal block of No. 10, the historic residence of the First Lord of the Treasury, for reasons of practical necessity and on account of its associations, should be retained, the Downing Street front being masked by erecting a new building with a good architectural façade, and the Park front cased in stone so as to harmonise with the north and west fronts of the old Treasury buildings, and the garden ground being enclosed with a screen or railing of handsome design. We do not recommend any further building on this site. We are of opinion that whatever other office accommodation is required which cannot be conveniently found in existing Government buildings should be provided for by an extension of the Great George Street site in the

direction of Delahay Street and St. James's Park, in which case some readjustment of the arrangement at present shown in the plan of the Office of Works might have to be made."

On the paragraph of the report proposing that the new public offices on the Parliament Street site should be erected mainly on the lines of plan No. 1, on a frontage in a line with the frontage of the Home Office, Mr. Herbert Gladstone proposed, by way of amendment, that in order to facilitate the traffic across Westminster Bridge and to Victoria respectively, the new frontage should be set back so far as to allow a division of the road space into two roadways, which could be marked independently of each other, but on a division being taken, this was negated by five to one, the right hon. member being himself the minority.

THE MOSAICS AT ST. PAUL'S.

AT various times during its progress we have described the great scheme of decoration which Sir William Richmond has designed in mosaic for the choir and sanctuary of St. Paul's Cathedral. That is now completed after five years of strenuous work, and there is no question about the richness and beauty of the result. The Artist is now proceeding to the body of the Church, for which he has in his mind's eye a further consecutive scheme, which will be carried out during the next few years, provided the Dean and Chapter obtain funds sufficient for the purpose. He is now at work on the quarter-domes under the big dome. Sir William Richmond starts from these quarter-domes with the idea of working upwards. Having

THE KEY OF COLOUR

for these parts, he will be able to find the key necessary for the great band round the Whispering Gallery, which will be his next task. Each quarter-dome measures 640 cubic feet, and all four will be filled with subjects illustrating the doctrine of the Atonement. The series consists of the Crucifixion, the Entombment, the Resurrection, and finally the mission to the Apostles to preach the Gospel to all the world. The Crucifixion is by no means treated in the conventional way. The Saviour is not infrequently represented in old manuscripts as crucified upon the Tree of Life. Sir William Richmond has adopted that idea for his design. The Tree of Life spreads over the whole space, and in the centre, where the branches part, is

THE FIGURE OF CHRIST

crucified. Right and left is a flowery meadow with corn-sheaves in the background, while from the base of the tree issues a stream which expands into a broad river in the foreground. The stream, of course, symbolises the Gospel. Beside the Cross are Mary the Virgin with St. John and the other two Marys, while at the extreme left and right on either side are the kneeling figures of Adam and Eve, as symbols of humanity. Adam seems to be preaching to the people below under the dome, and pointing to the sacrifice that has been accomplished, while the Virgin Mary is stretching out her hand to Eve and bidding her rise, since mankind is redeemed. The next design represents the Entombment. The scene is a garden of roses with the Cross in the background, while the body of the Saviour lies in the arms of an angel, who sits beside the open tomb. Round about are the Apostles in attitudes of veneration. The Artist has sought to banish sorrow, and to convey rather

THE BEAUTY AND SUBLIMITY

of the Christian idea. In this design, also, the River of Life will be seen in the foreground, and the garden will be gay with spring flowers, the figures being brought into relief against a thick wood of blossoming rose trees. From this we turn to the Resurrection, which will be in the south-east quarter-dome. This, again, is in a garden of roses, and in the distance are seen the walls of Jerusalem and the Garden of Olives. The tomb is on the

model of an ancient Etruscan tomb. A great door opens into an inner chamber, and on either side are two angels, who stand in shadow. Underneath is an enormous wing, which is supposed to represent the overshadowing wing of the Almighty. Day is breaking over the hills with a silver light, which spreads over a large part of the design. Golden rays shoot from the central figure of the Christ, who is represented as coming out of the tomb dressed in a robe of white, which

GLOWS WITH OPALESCENT COLOURS.

Roman soldiers lie sleeping beside a hedge of roses in bronze and silver armour. The angels who are opening the doors are in gold and silver with red wings. The fourth and last of these designs represents the mission to the Apostles. The whole of the background will be filled up with vine trees loaded with grapes, in allusion to the True Vine. The figure of the Christ is in the centre, and on either side of Him are the four Doctors of the Church, together with St. Peter, St. Paul, and Pope Gregory, who sent the first Christian mission to England. The latter is represented with the two boys whom he is alleged to have seen in Rome when he made the famous remark, "Non Angli sed Angeli." This completes the series for the four quarter-domes. From the quarter-domes Sir William Richmond will proceed to the Whispering Gallery, above which will be a great band or frieze running round the entire circuit of the big dome. For this Sir William Richmond has

A VERY INTERESTING SCHEME.

He hopes to make the frieze an allegorical representation of all the great religions of the world. Working from the idea that mankind has from the beginning of the world had yearnings after a knowledge of the Supreme Being, and that every religion which has been embraced by mankind has in it something of God, he would show the great religions of the world working up to the central conception of the Divine scheme as embodied in Christianity. In such a procession Egyptians, Greeks, Romans—Socrates, Plato, Aristotle, Seneca—perhaps even Brahmins, Buddhists, Mohammedans, might find place with the doctors, fathers, and martyrs of the Christian Church. If the big central dome is ever done, it would make the culminating point of the whole scheme. For this Sir William Richmond has visions of a great central design representing Heaven, the seat of God. That, however, is anticipating. Both time and money are still needed to finish what is already in hand. A sum of £16,000 is needed to finish the choir, the quarter-domes, and the frieze round the whispering gallery. If this is not forthcoming in a few months Sir William Richmond will

HAVE TO ABANDON THE WORK.

The great dome would take seven years to finish, and would cost a further sum of about £40,000. Sir William Richmond is quite prepared to devote the rest of his life to the work if the money is forthcoming, but the public must in that case respond to the appeal made by the Dean and Chapter. "In conferring a K.C.B. on the Artist the Government has," says the Westminster Gazette, "recognised in a most conspicuous manner the high merit and importance of this work." Governments, however, do not readily find money for Art, and the Cathedral is not their province. It still remains, therefore, for the private benefactor to provide the funds for this great national work.

THE BISHOP OF LONDON on Thursday consecrated a new Church, dedicated to St. Peter, which has been erected at Lower Edmonton. The building will seat 520 people, and has cost £3800. A chancel is to be added in the future.

It has been decided by the Corporation to redecorate Blackfriars Bridge. Several large sheds for the accommodation of the workmen are being erected on the projection of the Embankment on the west side of the bridge. The contractors are Messrs. Harrison and Spooner.

Professional Items.

ABERDEEN.—At a meeting of the Sewerage Committee of the Aberdeen Town Council last week tenders were opened for the construction of the large outfall sewer from Palmerston Road to beyond Victoria Bridge. It was found that the lowest offer was that of Mr. George Pirie, which amounted to £8072, being more than £1000 below the next estimate. Mr. Pirie's offer was accepted. The offer of Mr. John Bain was accepted for the construction of new sewers in King Street and Footdee.

BRISTOL.—Baldwin Street is rapidly taking its place as one of the chief business thoroughfares in the City of Bristol, as is shown by the keen competition for sites in it. Only one available space will remain after the completion of the block of buildings now being erected next to the Midland Railway Company's offices. Amongst the numerous buildings that have lately been added to the street not the least attractive will be the County Auction Mart and offices. The premises have a frontage of about 32ft., are in the Flemish style of Architecture, and built of moulded brickwork with freestone dressings, the arches being of rubber brick. The plans were prepared by Messrs. Gingell and Bond, of Alliance Chambers, Corn Street, and the buildings are being erected by Messrs. Ford and Canning, of King Street Hall, the owners of the property.

BURTON-ON-TRENT.—The new free library has been opened to the public. The building is situated in Union Street, and is that which was formerly occupied by the Burton Institute authorities. Since it was taken over by the Corporation extensive alterations have been made, and the latest improvements introduced. The fittings are for the most part pitch pine, the partitioning being ornamented with fancy glass. The electric light has been installed and the various rooms have been smartly painted and decorated, while the heating apparatus has been greatly improved.

BUTE DOCK.—The Bute Dock Offices were opened yesterday week. The massive pile is situated midway between the East and West Dock basins, with a frontage due south to the Cardiff Entrance Channel, which has long been a familiar landmark. The front of the building is surmounted by a tower of very fine and shapely proportions. A handsome clock has been placed in this tower by Messrs. Potts and Co., of Leeds, and the record of fleeting time is sounded on a particularly deep-toned bell. The main building runs away from the tower to the north, and the general appearance, save for the relief afforded by the architectural features, rather reminds one of a Church. Built of Ruabon red brick and terra cotta tiles, the exterior of the building presents a striking appearance, and reflects credit on Mr. Frame (Architect to the Marquis) and Mr. E. M. Corbett (Architect and surveyor to the Bute Estate Office). The interior arrangements of the new office have made with the leading idea of comfort and convenience. The offices of the departments most in request by the general public are on the ground floor—viz., those of the dockmaster, joint collectors, coal, shipping, warehousing, timber, wharfinger, ballast, &c. The main entrance hall, which is very wide, and runs the entire length of the building, is laid with mosaic pavement. The first floor is principally taken up with the offices set apart for Sir W. T. Lewis, Bart., and Mr. James Hurman (general superintendent), the accountants, engineers, &c. The second floor is largely taken up with the caretakers. Including heads of departments the staff accommodated in the new buildings totals nearly 100. The cost of the new offices, which have taken nearly three years to erect, runs to close upon £30,000. The contractors were Messrs. W. Thomas and Co.

CARDIFF.—At a meeting of the Cardiff Museum Committee the proposed new site for the Museum in Cathays Park was discussed. It was resolved that a deputation wait upon

the Corporation at its next Council meeting in respect of a site, and respectfully suggest that the site they would prefer is immediately north of the site of the proposed new municipal buildings, with a frontage to the avenue.

At a meeting of the Public Works Committee of the Cardiff Corporation a deputation attended with reference to the proposal to pave a certain part of Bute Road with granite sets. The deputation presented memorials objecting to the using of the granite sets, on the ground that considerable vibration and noise would be caused, and it was suggested that wood paving should be laid down instead. Councillor F. J. Veall moved that the borough engineer be asked to prepare an estimate showing the difference in the cost of wood and stone paving. The committee expressed the opinion that it could not go beyond the resolution previously passed.

CHELTEMHAM.—The Town Improvement Committee of the Cheltenham Town Council has had before it eight sets of tenders for the erection of municipal buildings, a kursaal, and winter garden, varying from totals of £46,600 to £52,500. After consideration, the committee decided to recommend the acceptance at the next Council meeting of the tender of Messrs. A. Escourt and Son, of Gloucester, at £46,600, made up as follows:—Municipal buildings, £21,019; kursaal, £21,341; and winter garden, £4,240.

EXETER.—The foundation-stone of the new St. David's Church at Exeter was recently laid by Mrs. Thornton-West, of Streatham Hall, in the presence of the Mayor and Corporation of Exeter. The Church, when completed, will seat about 850, and will have a massive square tower, 100ft. in height. The style of Architecture is of the Transitional period, from the Decorated to the Perpendicular in the fourteenth and fifteenth centuries. Mr. W. D. Caroe, M.A., is the Architect, Mr. W. Dart, of Crediton, the contractor, and Mr. F. Powell the clerk of works.

GLASGOW.—Several applications for the necessary authority to erect new buildings in the city have been granted by the Glasgow Dean of Guild Court. The North British Railway Company was authorised to erect new tenements in Canning Street; Henry M'Arthur, C.A., to erect tenements of dwelling-houses in Springburn Road; Gavin Stewart and Company, to erect tenements of dwelling-houses and shops in Springburn; Donald Ross, builder, to erect tenements of dwelling-houses in Springburn; Thomas Morgan, builder, to erect four tenements of shops and dwelling-houses in Cumbernauld Road; and P. Hepburn and Company, upholsterers, to erect a furniture warehouse in Otago Street.

GOLCAR.—Sir James Kitson, Bart., M.P., Lord Mayor of Leeds, recently opened the new Sunday school premises which have been erected on the site on which stood the old Baptist chapel, built in 1834. The new school contains thirteen classrooms, infants' schoolroom, secretary's room and library, and an assembly hall. The front elevation is in the Renaissance style of Architecture, built of Elland Edge pitch-faced wall stones and Crosland Hill ashlar dressings. The internal joiners' work is of pitch-pine, varnished; the roof is covered with blue Westmoreland slates. Accommodation is provided for 700 persons. The work has been executed by the following contractors, viz.:—Masons, Messrs. A. and T. Haigh, Golcar; joiner, Mr. Wm. Lockwood, Golcar; plumber, Mr. John Marsden, Huddersfield; slaters, Messrs. T. Longbottom and Sons, Huddersfield; ironwork, Messrs. G. W. Crosland and Co., Huddersfield; plastering and painting, Mr. Wilson Armitage, Golcar; wood block flooring and concreting, Mr. John Cooke, Huddersfield; heating apparatus, Mr. F. Milan, Huddersfield; electric bells, Mr. Fred Taylor, Golcar. The whole of the work has been carried out from the designs and under the superintendence of Mr. J. Berry, Architect, 9, Queen Street, Huddersfield.

GRAYLING WELLS.—The chapel at the new West Sussex Asylum buildings, Grayling Wells, was dedicated a day or two ago. The chapel, which is surmounted by a little bell turret, stands northward from the main buildings of the Asylum, and is decidedly pleasing in appearance. It has a design of thirteenth century style, and is constructed externally of land flints, gathered entirely on Grayling Wells Farm, with box ground stone dressings, and a roof of red tiles. Inside, the materials used are Cosham Down stone dressings and plaster, while the base and capital of the circular columns are composed of congrit stone. The Church consists of nave, with side aisles, shallow transepts (to be used for an organ chamber and vestry), chancel, and two epileptic rooms. Seating accommodation is provided for about 360 persons.

LEEDS.—At a meeting of the Leeds School Board, Mr. J. Midgley asked the Board to accept tenders, amounting to £3804 14s., for the erection of a new infants' school at Hunslet Carr. This addition would provide 530 school places at a cost of £7 3s. 6d. per head—a very moderate rate—and would meet the needs of the district for some time to come. Mr. Peaker seconded, and the Board assented. Mr. Midgley further asked the Board to approve of tenders, amounting to £675, for the enlargement of South Accommodation Road School. The tenders were accepted. The Board also decided to accept tenders for the heating of Whingate Board School, at a cost of £185 10s. Mr. Midgley stated that when the heating apparatus had been fixed, the renovation of Whingate School would be complete.

At a special meeting of the Town Council Mr. Knowles moved that the Markets Committee be authorised to build a wholesale dead meat market and abattoir on a portion of the market estate bounded by York Street, Harper Street, and Sykes Place, at an estimated cost of £24,000, and to offer such premiums as they may think reasonable for the preparation of plans and estimates. As the Council was aware, owing to the projected demolition of the Shambles, and the clearance of the adjacent slaughter-yards, it was necessary that such a market should be erected. The value of the proposed site is £6000, or about £2 per yard, and this is included in the estimated cost of the new market and abattoir. The resolution was carried.

The memorial stones of a Wesleyan School-Chapel were recently laid. It is situated in Ladypit Lane, Beeston Hill. Mr. G. F. Danby is the Architect for the new structure, which will be of brick, with stone dressings, plain externally but commodious, affording accommodation for 250 worshippers. There will also be three class-rooms, and by means of a patent folding partition one of these will, when occasion demands, supply fifty additional seats. The total cost is estimated at £1250, and up to Saturday some £600 had been raised. Mr. W. Schofield has the contract for the brick and stone work, and Messrs. J. Tomlinson and Son for the woodwork, a large portion of which will be pitch pine.

LYDNEY.—A new post office has just been built at Lydney, at a cost of £2000. The building was erected by Messrs. Kear and Son, from plans by Mr. Howard Howells, of Lydney. The new premises contain excellent accommodation for post office work in all departments.

MADDERTY.—The Parish Church—one of several with which Gilbert, Earl of Strathern, endowed the Monastery of Inchaffray early in the thirteenth century—is at present undergoing a thorough renovation. An entirely new entrance from the north side, with porch facing the west, takes the place of the two openings now built up. A new heating apparatus is also being introduced; three new window spaces have been made, and these, with the former spaces, are in the Gothic style of Architecture. Although the old gallery has been removed, the arrangement which has been followed in regard to the area sittings provides additional accommodation over all.

The inside walls, which are perceptibly uneven, are to be coated with cement, and coloured and blocked like the stone composing the building. Five ornamental Gothic arches serve well to break up the monotony of the upper portion of the building. A beautiful tracery window of three compartments; a handsome richly-coloured three-light window, representing the crucifixion, St. Mary, and St. John the Evangelist, and having at the right and left lower corners respectively the obverse and reverse of the ancient Inchaffray seal; an elegant rose-shaped window, showing a series of the emblems of the Christian faith, are being added to the Church's adornment. The glass work is being executed by Messrs. Ballantyne and Gardiner, Edinburgh.

NEATH.—The foundation-stone of the commodious new offices to be erected in Orchard Street, Neath, for the Neath Rural District Council, has been laid. The offices will be reared on a site purchased from the trustees of the Dyffn Estate for £500. The plans of the building have been prepared by Mr. D. M. Davies. Messrs. Thomas Watkins and Co. are the contractors.

NEWCASTLE-ON-TYNE.—It is proposed to erect on the Quayside a new and commodious Exchange, which will give such accommodation as can only be adequately obtained in a building expressly designed and built for the purpose for which it is intended. The proposed site is in the centre of the Quayside, facing the river, and the cost, including both the land and the new building, and all incidental expenses, is estimated at £20,000. The entrance to the Exchange is wide and roomy. After passing the lobby, the vestibule, or hall, is reached, from which one door opens to the newsroom and another to the Exchange. This vestibule has purposely been made large, as it may be used for conversation, and on account of its size it will prevent any draught reaching the newsroom or Exchange. It will have excellent light from the top and end. The hall occupies the major portion of this site, having a floor area of 5115 square feet, being much larger than the present Guildhall Exchange. The proposed height is 30ft. to the ceiling; the domes spring from this line 10ft. higher. The heights could be increased if thought desirable (the present Exchange is only 18ft. high). Advantage has been taken of the large open space of the Trinity House courtyard, by placing windows at the north end of the Exchange for additional ventilation. The lighting will be principally from the top, by means of three large domes, 24ft. diameter, each surmounted by automatic ventilators to prevent down draught. In addition to this, there will be large windows at each end of hall near ceiling, to create a through current of fresh air when the hall is not in use. It will be found that expensive mechanical arrangements for ventilation can be dispensed with. Mr. Charles T. Marshall is the Architect.

OLDHAM.—Mr. W. O. E. Meade King, an Inspector of the Local Government Board, recently held an inquiry at the Oldham Town Hall respecting the desire of the Watch Committee and Town Council to borrow £8500 for the purpose of erecting a new police and fire station, along with police and firemen's dwellings, on a plot of land at the junction of Frederick Street and Manchester Road. The Town Clerk said that in the borough there were four police stations—the chief one known as the Central, and the others Townfield, Werneth, and Lee Street. The existing station and premises at Werneth were used for both police and fire purposes, but the whole premises, including the dwellings occupied by the officers, were totally inadequate and unfit for the purpose. Last year the Corporation was able to obtain a plot of land in a good situation. The contents of the plot were 4729 square yards, and the land had been taken at an annual chief rent of £150. This land was acquired about July of last year, and immediately after that sanction was obtained from the Town Council to get in competitive designs for the proposed premises. These plans had been submitted to the Local Government Board, and by it

passed on to the Surveyor of the Prisons Department of the Home Office, who approved of them with a very slight alteration, which had since been made. The proposed scheme provided for the following accommodation:—(1) Police station, including charge room, parade room, six cells, inspector's room, lamp room, bathroom and lavatory accommodation, and house adjoining for the inspector; (2) Fire station, including house for three engines, four-stall stable with provender store overhead, hose-drying tower, washing shed, harness room, paint and work shop, and all the necessary conveniences; (3) 18 dwellings for police and firemen, plus the house for the inspector. The bulk of the cottages would face Frederick Street, and the remainder would face Napier Street West. Each house would have three rooms upstairs and three down, and would have a separate yard and outbuildings. The Architect's estimate had been very carefully prepared, and the sum of £8500 included Architect's commission, furnishing of the police and fire offices, completion of the whole buildings, and £150 for a public clock in the tower.

PORT TALBOT.—A new Church at Port Talbot, dedicated to St. Theodore, was consecrated last Thursday. The edifice is Early English in style, and consists of nave, aisles, two transepts, south chapel, chancel, and vestry. The main walls are built of native stone, with Bath stone dressings.

TORQUAY.—To consider an application by the Torquay Town Council for sanction to borrow £1000 for the purchase of pleasure grounds, Mr. W. A. Ducat, Local Government Board inspector, attended at the Town Hall a day or two ago. The town clerk (Mr. Hext) explained that the application was in respect of the acquisition of the plot of ground at Castle Corner, upon which it had been decided to build the new Town Hall. The purchase price was £4300, and the portion abutting on the St. Marychurch Road, reserved for the Town Hall, was about an acre in area, valued at £3300. The other two acres, valued at £1000, it was intended to convert into a public pleasure ground. Torquay's total debt was £348,893, of which £197,000 was for the water and harbour undertakings, and there was an ample margin on the balance of £202,000 before two years' assessment of the rateable value of £138,265 was reached. No opposition was offered.

TYNEMOUTH.—The new east wing of the Tynemouth Victoria Jubilee Infirmary, North Shields, was formally opened on Friday. Built by Messrs. J. and W. Simpson, of North Shields, from designs by Mr. F. R. N. Haswell, of the same town, the ward measures 32ft. by 24ft., and is arranged to contain six cots, and four beds to be devoted to female patients. There is a large bay window, seated round, and in the south end are a duty-room and sitting-room for nurses, and two isolation wards, with the necessary sanitary arrangements. On the first floor there are two bedrooms for nurses. Owing to the fall of the ground, there is a basement 7ft. high under the whole of the new wing, in which is placed an auxiliary boiler for hot water service, the remainder of the space being available for storage, and for communication with the main boiler room. The new wing gives symmetry to the entire structure, and completes the building for all practical purposes, but should funds and circumstances permit of any further extension, a porter's lodge will next receive the attention of the committee.

WESTON-SUPER-MARE.—The central Board Schools, which have been erected by Mr. Chas. Addicott, upon Messrs. Price and Wooller's plans, are now nearing completion. The building is of local stone, with Bath stone dressings, and covered with plain Bridgewater tiles. There are separate departments for girls, boys, and infants, with separate playgrounds. In each playground a covered playshed is provided, and the sanitary offices are spacious and convenient, and fitted with Adams's latest improved patent syphonic

multiple apparatus, with automatic flushing cisterns. The drainage throughout is arranged on the most modern principles, and all has been subjected to the hydraulic test. The playgrounds are asphalted. Each department has two entrances for the scholars and one for the teachers; cloak-rooms and lavatories are provided of the most modern type. There is a central hall for each school, measuring 40ft. by 34ft., and 30ft. high, well lighted and ventilated. Surrounding this hall are class-rooms with accommodation for sixty scholars in each. A room is set apart as a centre for cookery classes. This is approached by a separate entrance from the girls' playground. There are also a chemistry room and drawing class-room, each 26ft. by 24ft.; separate sitting-rooms for the head master and mistress, also for the assistants of each department. There are also laundry and drying-rooms, and a carpenter's shop. The whole of the work has been under the immediate personal supervision of Mr. T. W. A. Hayward, surveyor, of Hillesley and Weston-super-Mare. The heating of the building is by low-pressure hot water, one pipe relief system.

HARROGATE.—We learn that at the Royal Baths the marble mosaic floors have been laid throughout by Mr. J. F. Ebner, of London. The mosaic is mostly Roman-Venetian, and Ebner's patent marble Terrazzo. The ladies' and gentlemen's dressing hall and waiting rooms are laid in oak parquet on concrete, and the dressing rooms, passages, and winter gardens in pitch pine blocks on concrete, upon Mr. Ebner's patent system.

SOCIETY MEETINGS.

Royal Archaeological Institute.—The annual summer meeting of the Royal Archaeological Institute was opened at Dorchester on the 4th inst. The secretary of the meeting is Mr. Mill Stephenson, and the local secretary is Mr. H. J. Moule, curator of the Dorset County Museum. The president for the year, General Pitt Rivers, delivered his presidential address, dealing chiefly with his excavations at Rushmore and his discovery of flints in Egypt. Among those present were Sir H. Howorth, Professor Boyd Dawkins, Professor Clarke, the Rev. Sir T. Baker, and other well-known archaeologists. The members visited various objects of interest in the town, under the guidance of Mr. Moule, including the Roman Amphitheatre and the County Museum.

Newcastle Society of Antiquaries.—At the monthly meeting of the Society of Antiquaries of Newcastle-upon-Tyne, the secretary reported having received, on behalf of the Society, from Mr. Hugh W. Young, a drawing of what is claimed to be the oldest tombstone in Moray. This remarkable stone was unearthed in 1890, at the very point of the promontory at Burghhead. Mr. Nicholson, of Oxford, had translated the inscription, which was lettered in the early type of Roman Christian stones, as recording the graves of "Mac Bead and of the daughter of Le." The stone had been the dividing stone of two burial plots of the Mac Bead and Le families. Mr. Nicholson fixed the date of the stone as being, perhaps, about the year 1000, while Professor Sayce thought it might be as old as the sixth century.—Sir Gainsford Bruce presented a printed pamphlet regarding the memorial erected in Newcastle Cathedral to his father, Dr. Collingwood Bruce.—Dr. Hodgson gave a discursive description of a journey in Apulia, starting from Barletta.

It has become necessary to make substantial enlargement in the shape of a new wing to the Wesleyan Chapel, East Kirkby. The contract has been let to Mr. W. Rigley for £532.

The construction will be commenced almost immediately of a new quay in Brindisi Harbour, alongside which the Peninsular and Oriental steamers will be moored. This new quay will adjoin the harbour railway station. The quay will be roofed the whole distance from the steamer berth to the station.

Trade and Craft.

MESSRS. C. P. KINNELL AND CO.

The principles and construction of hot-water apparatus is a subject which for years has claimed the earnest attention of Messrs. C. P. Kinnell and Co., of 65, Southwark Street, S.E., and their wide experience in and grasp of all matters pertaining to a satisfactory solution of the difficulties involved has enabled them to place hot-water apparatus on the market which has earned widespread popularity. Messrs. Kinnell's Silver Medal Horse-shoe boiler has been greatly improved by the addition of a hot blast into furnace, in combination with a tilting bottom grate and a draught-regulating valve, which works automatically under any conditions. The great waste of heated air in ordinary boilers, through the exposure of the boilers themselves, is utilised in the "Horse-shoe" by being carried into the furnace for the purpose of supporting combustion. A greater depth of furnace, intense heat against back of boiler, special means for the regulation of the amount of air gaining access to the furnace, thus easily securing a uniform rate of combustion, are a few of the advantages of this apparatus. Another boiler, the "Southwark," has been specially designed for working with very shallow drainage, and is capable of heating long ranges of piping. Principal among the radiators illustrated in the Company's catalogue are the "Kinnell," the "Mammoth," and the "City." The first-mentioned has a projection of 3in. only; it has eight tubes in every 13in., and each section connects into the top and the bottom waterways, which are continuous. The "Mammoth" is of simple construction, any section being removable by withdrawing the top and bottom bolts. It is equally suitable for steam or low-pressure hot water, and has been specially designed to give increased heating power in the same length and height occupied by the "Kinnell," the projection from back to front only being greater. The "City" radiator is of somewhat more ornamental design, the ornamentation upon the castings having a highly decorative effect. A large variety of castings are also illustrated in the catalogue.

RAILWAY EXTENSION.

There is talk just now of railway extension and expansion in all quarters of the globe. Some while since a good deal was heard of what was about to be done in this direction in India and in Northern China, and now from Amsterdam there comes information that the Dutch authorities propose to construct several lines of railway in the Netherland Indies, and that survey parties are about to leave Holland for Java and Dutch New Guinea for this purpose. The necessary powers are to be conferred upon a syndicate of bankers and merchants which has been formed in Holland, and which will lease the lines when built from the Government, and about 700 miles of line are in all to be laid. A report comes simultaneously from Brussels to the effect that contracts are to be placed towards the end of the month for some 3000 tons of rails and a quantity of steel bridge work for Congo railway development. A survey party, consisting of five engineers, is leaving Brussels about September 5th to prepare for the construction of a new line further into the interior, in order to facilitate the transport of rubber and ivory. There remains to be added a report that an American syndicate has acquired concessions from the Mexican Government for the construction of the connecting lines to form a trans-continental system from the Atlantic to the Pacific.

MONT BLANC MOUNTAIN RAILWAY.

The Mont Blanc Mountain Railway is in swift progress. The works along the Arve, from Le Fayet to Chamounix, will soon be completed, and then they will proceed with the actual mountain railway, from Chamounix (3400ft. across Montanvert, 6250ft.) to the Mer de Glace. The length of this mountain line

will be 5.5 kilometres, and the ascent will amount to about 900 metres. The first half of the climb of the railway carriages will be effected by the adhesion system, the other half by the cog-wheel system, as on the two Rigi railways. It is anticipated that the railway to the Mer de Glace will be completed in the year 1900.

THE RAILWAY UP THE JUNGFAU.

The most extraordinary of all modern railway projects, the line to the summit of the Jungfrau, is being pushed forward with all earnestness. About 150 Italian navvies are at work upon the little tunnel below the Eiger glacier, and have nearly completed that part of the work. It is expected that by the beginning of September the whole line will be finished as far as the Eiger glacier. The electricity works at Lauterbrunnen are preparing to supply the necessary force for the boring operations in the great tunnel. It is now under consideration whether the works shall be carried on during the winter. In case the proposal should be adopted, the most extensive and careful preparations will have to be made for the housing and nourishment of the workers under such utterly unprecedented conditions.

THE NEW CARBON WORKS AT GREENOCK.

The new carbon works in Greenock, belonging to the British Aluminium Company, Limited, opened by Lord Kelvin a few days ago, situated in Baker Street, are intended for the manufacture of carbons for the reducing furnaces at Foyers, the raw material being retort carbon, a bye product of the gas-works, a large quantity of which is obtained from the Glasgow gasworks and from other large towns in Scotland. The chief features of the process are the great pressure at which the carbons are moulded by powerful hydraulic machinery, and an unique annealing furnace heated by producer gas made by plant supplied by the Dowson Economic Gas and Power Company Limited. This process requires a certain amount of power, and this is supplied by the Greenock Water Trust through the existing conduit. The resident engineer of the Company is Mr. H. J. Bubb, and the consulting engineers are Messrs. McArthur and Orkney, City Buildings, Greenock.

New Roman Catholic day-schools, erected at a cost of £4000, were recently opened at Batley.

The new wing which has been placed to the Rochdale Infirmary as a memorial of the Diamond Jubilee year was recently opened.

An anonymous philanthropist offers to contribute £10,000 towards the provision of a large general hospital for the parishes of Lambeth, Camberwell, and Battersea. It is stipulated that the contract for the erection of the hospital shall be entered into not later than August, 1899, and that no medical school shall at any time be formed or carried on in connection with the institution.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN (N.B.)—For the execution of road works, Leaside-road and Holburn-street, for the Town Council. Mr. Wm. Dyack, Borough Surveyor, Town House, Aberdeen.

J. Eyre, Aberdeen .. £1,408 16 2
ANDERSHAW—New classroom to St. Stephen's Central Schools. Mr. J. H. Burton, Architect, 2, Guide-lane, Hooley Hill.
 James Whitehead, Ashton-under-Lyne £268 15
 Joseph Clayton, Denton .. £194 0
 James Ridyard, Ashton-under-Lyne .. 208 10
 Exors. of T. Storer, .. 191 10
 Charles Evans, Ashton-under-Lyne .. 200 0
 Z. Pike and Son, .. 180 0
 Hoolley Hill* .. 180 0
 * Accepted.

The Effigy on the Tomb.

THERE are few persons who do not experience an emotion of pleasure at beholding an object of Art, the execution of which dates back to ages long since past; and that pleasure is very considerably enhanced when one can ascertain any circumstances in connection with the antiquity—for instance, the time a monument was raised; the station in life of the person it was designed to commemorate. Especially interesting is such information when, as is often the case, the recording inscription has become obliterated by the action of time. It is to antiquarians, chiefly, we owe our information. It is they who have ascertained that monuments of the earliest date are those of stone sarcophagi, the top formed in the shape of a prism, like the sloping roof of a house, to allow of the rain-water running off, for they were always built in the open air. The oldest of such monuments are without inscriptions, and their form alone affords a guide as to their age. It was not until the middle of the twelfth century that these stone coffins began to be ornamented. From that time carvings, chiefly of a grotesque character, but occasionally consisting of armorial bearings, appeared on them. These are the earliest specimens of such sculpture, but they rise in excellence, completeness, and general beauty as the years roll on. The sloping tops gradually disappear with the progress of sculptured emblems. Not content with merely carving the cover of the monument itself, figures were cut separate therefrom, and the tops became flattened for these figures to be laid upon them. This stage of Art was not arrived at until the succeeding century, so that the spectator may be sure that a monument with a flat top is not of greater antiquity than the period mentioned, whether it be supporting an effigy or not. Of figures there are various kinds. Those which have their hands laid on their breasts, with chalices in them, denote, of course, that the person so commemorated was a priest. Prelates are always represented with their insignia—pontificals, croziers, or mitres, whilst knights can be recognised by their armour. Most of them are lying flat on their backs, and often with their legs crossed. These have either been crusaders (*crux*, a cross) or married men; beside these latter a statue of the wife is often laid. The explanation of the married men lying cross-legged like the crusaders is not forthcoming—perhaps it was emblematical of the cross of life. The several descriptions of armour by which the effigies of military men are covered are sure guides as to the times when they lived. Thus warlike figures of the earliest date are found in tegulated or scale armour, like that of William Longsword, Earl of Salisbury, Fair Rosamund's son in Salisbury Cathedral, who died in 1227. Chain armour, or mail composed of small iron rings, is seen in figures of later date, from the reign of Richard Cœur de Lion to that of Henry III. Many specimens of this kind of armour are still extant in country churchyards, *e.g.*, Hitchendon, Bucks. Plate armour seldom appears in knightly effigies more ancient than the latter reign. Female figures represented as wearing a mantle and a large ring, denote that the deceased had taken the vow of chastity. Armorial quarterings of arms annexed to tombs show them to have been

raised subsequently to the fourteenth century, while supporters were not adopted till the reign of Richard II. At a later period arches were raised over tombs to protect them from the action of the weather, but gradually sepulchral monuments were removed within doors and built in Churches. In the course of time it was found that those arched monuments took up too much room, even in the most spacious Cathedral. To lessen this inconvenience, a plan was devised which gave rise to the practice of annexing chapels to the Churches, expressly for containing such mausoleums. These chapels are, in many instances, only separated from the

continued to be either sculptured or engraved on tombs till the seventeenth century, although other devices were adopted as well. Immediately after the Gothic age of chivalry more solemn emblems were employed. Skeletons in shrouds began to be used in the fifteenth century, and these were followed by corpses (or portraits of them) in shrouds, with the head bound up and the feet tied. Sometimes images of children were placed at the feet, and cherubims at the corners of the tomb. These devices, of unpleasing character, were generally employed for deceased ecclesiastics, and one such, to Dr. Donne, is to be found in St. Paul's Cathedral—relic from

LEVENS HALL. THE LITTLE DRAWING ROOM. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

main body of the building by iron rails, and are entered by doors from the side aisles. This practice did not come into vogue until the fifteenth century. Figures in half-relief or ordinary sculpture multiplied so much in course of time that a less elaborate mode came to be adopted. This was by simply engraving or incising the effigy on slabs of stone or on plates of brass. One of the earliest of these is that of Jocelin, Bishop of Wales, placed by himself during his lifetime in his titular Cathedral in 1242. The earliest existing specimen of the sort is that of Sir Roger de Trumpington, who accompanied Prince Edward in the Holy Wars, and who is represented with his legs crossed. It is preserved in the Church of Pebmarsh, near Halstead, in Essex. Recumbent effigies

the old Cathedral. The antiquary is often guided as to the status of the individual by the situation in which the tomb is found. The most important sepulchres were those of saints, who, on account of the veneration in which they were held, were enshrined, the shrines being generally on the east of the altar, though there were many in other convenient parts of the Church. According to his sanctity, so were the remains elevated above the ground. The bodies of unsainted men, yet of great piety, were placed on a level with the surface of the earth. The coffins of saints of the second class rested on the flooring of the edifice, whilst those of martyrs were elevated. Effigies carved in wood were often placed over the shrine to excite devotion. Monuments built in the

WITH THE A.A. IN LANCASHIRE. MEASURED AND DRAWN BY E. P. MILNER FOR THE JOHN O' GAUNT SKETCH BOOK.

walls are chiefly those of the founders of chapels. Tablets or figures against the walls did not come into use until the time of the Reformation. The proper burial place of the founders of churches and chapels was the porch, and it was the custom of worshippers on entering to pray for them as they crossed the threshold. Thus Leofric, Earl of Mercia, and his wife, the celebrated Lady Godiva, were interred in the porch of the Abbey Church, Coventry, which they founded. The heads of religious houses were buried in their chapter houses or cloisters, and rectors or vicars in the vicinity of the altar or chancel of the Church they belonged to. Lords of the manor were also interred in the chancel, sometimes within the rails. The guides to the date of tombs are, of course, the inscriptions. But, as many of these afford no clue as to when they were cut, the following, in conjunction with accessory facts, may be of use. During the first twelve centuries all epitaphs were inscribed in Latin, and the first are those of Romanised Britons in Cornwall and Wales. These are written in capital letters, but in some cases a small hand was introduced in the seventh century. Lombardic capitals came to be employed in the thirteenth century, when epitaphs in the French language also began to appear. These continued to be used until the fourteenth century, generally in German text. Since that time vernacular English and Roman print have been ordinarily employed, though the clergy and the learned have ever preferred to retain the Latin tongue for epitaphs. We question whether, when the history of the Victorian era comes to be written, any particular style or form of churchyard decoration will be associated with that period, for now fancy runs riot in the matter of design for memorials of the dead, from the richly-carved sarcophagus to the plain headstone with its bald narrative. Anyway, enough has been dealt with in the preceding lines to demonstrate

that the study of the Effigy of the Tomb is anything but an uninteresting or dry branch of lore to pursue.

RESTORATION OF SALISBURY CATHEDRAL.

THE work of restoring the tower and spire of Salisbury Cathedral is proceeding rapidly, and it is hoped that by the end of the present year the whole work will have been completed. Sir Arthur Blomfield, the Architect who has had charge of the work, has just furnished the Dean and Chapter and the Committee responsible for the restoration with a report of what has been accomplished under his direction. He says that the tower has been strengthened in every way possible, the shattered stones being replaced by others of a more durable nature, and the foundations carefully examined and restored. His examination of the building revealed a lamentable state of things, and it was evident that, if it were allowed to exist, a disaster of some considerable proportion would ultimately take place. He has also reported that the turret at the north-west of the Cathedral was in such a bad state that it was necessary to take it down. It has now been rebuilt. The work was one of great difficulty, but it has been accomplished in the most workmanlike and satisfactory manner. Every stone that could be re-used appears again in its proper place, only new stones being introduced wherever the original stonework has been crushed or broken, or are such small stones as to be unsafe. The Very Rev. G. D. Boyle, the Dean of Salisbury, has informed the Committee that the tower and spire has been secured as far as human means go for future generations. The cost of the work will be £15,000, of which the sum of £12,000 has been paid or promised. Considering the national interest evinced in the Cathedral and spire, the Dean and Chapter felt that the time had come when they could reasonably appeal

to the public to assist in restoring the spire and tower of the Cathedral, and thus remove the burden which pressed heavily on those who were the proper custodians of the Cathedral. Her Majesty the Queen has forwarded a communication to the Dean expressing sympathy with the objects of the Committee, and enclosing a cheque for £100. The Committee consists of the Dean of Salisbury, Lord Nelson, Lord Radnor, Lord Pembroke and Montgomery, Mr. Edward H. Hulse (late member for Salisbury City), and Mr. Arthur Whitehead (the Mayor of Salisbury). Among those who have subscribed liberally towards the fund for the completion of the work are the Marquis of Salisbury, the Bishop and the Dean of Salisbury, the Rev. Chancellor Howard, the Hon. and Rev. Canon Gordon, the Rev. Sub-Dean Bourne, Lady Hulse, Mr. W. McCalmont, Lord Wimborne, the Earl of Eldon, the Hon. W. F. D. Smith, M.P., Mr. A. Morrison, the Marquis of Lansdowne, Sir A. Neeld, Mr. G. Fuller (late M.P. for the Westbury Division of Wiltshire), Viscount Portman, the Hon. Percy Wyndham (High Sheriff, Wiltshire), the Earl of Radnor, Mr. F. Macdonald, and Mr. Shaw Stewart.

A serious subsidence recently occurred in the sanctuary of Dane Bridge Parish Church, Northwich. The floor was supported by brick arches. One of these gave way, owing to the sinking of the foundations, caused, it is said, by brine pumping, leaving a hole some 6ft. long and nearly 4ft. wide. The porch walls show large fissures, and the whole fabric has suffered considerably.

At the pretty and historic Church of St. Chad's, Over, near Northwich, the foundation stone was laid last week of two new vestries and an organ transept, which are being built at a cost of nearly £1000. This is the first time since the year 1543 that the fabric of this ancient Church, which dates from the reign of Edward I., has been substantially enlarged. For more than 350 years its walls have stood very much as they are to-day.

THE ARCHITECTURAL ASSOCIATION TOUR.

LANCASTER AND THE NEIGHBOURHOOD.

(Continued from page 5.)

LEAVING Borwick Hall and again taking to the high road, after a few miles ride Beetham is reached. A little to the left we find the Church, much of which was restored some few years since, but the tower was left intact, and presents an uncommon appearance, the upper portion being corbelled out about a foot. The interior of the Church contains some very good modern work; the tower screen especially excites our admiration as a piece of interesting detail. About a mile from the Church is Beetham Old Hall, very picturesque in its present ruinous state, but of little architectural importance.

From Beetham the road continues through charming scenery to Milnethorpe, a place we longed to sketch, though time did not permit. On the green in the centre of the village stands the old market cross, which, with the Church and cottages, form a most picturesque group. After Milnethorpe a couple of miles brings us to Levens Hall, the most northern point of the tour. Levens Hall is situate on the banks of the river Kent. The approach from the beautiful river is all that could be desired. Immediately to the right of the principal entrance is the "Pele" Tower, the usual fortified tower of houses in the Border counties; and around the tower, in sombre tints of grey, clusters the old Elizabethan Manor House. We enter into a large hall, panelled throughout with an intricate frieze of plaster work, here and there relieved with

LEVENS HALL, THE DRAWING ROOM. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

colour, merging into an elaborate plaster ceiling, among the plaster ornamentation the Tudor badge of a rose and crown, the red and white roses of York and Lancaster, the fleur-de-lis, bugle and deer badges of the Bellinghams, frequently appear. Passing to the dining room, the effect of the Spanish leather hangings with background of burnished gold is most brilliant. The drawing room, also, has

some very good diamond pattern oak panelling. From the hall we ascend the oak staircase of the seventeenth century to the upper floors.

In Norman times Levens formed part of the possessions of Tosti, Earl of Northumberland, and towards the end of the fifteenth century it passed by purchase into the Bellingham family, and after remaining in their possession for some two centuries it was purchased by Colonel James Grahme, in the possession of whose descendants it has continued ever since. Amongst the many owners of Levens, two only need be considered here. The first, Sir James Bellingham, by whom the house was altered from a grim Pele tower to a stately Elizabethan mansion. The greater part of these alterations took place between 1586 and 1595. Thus, on the carved oak chimney-piece of the dining-room and elsewhere about the house, we see carved his initials, I.B., and the date, 1586. Nearly the whole of the windows throughout the building were inserted about this time. Colonel Grahme, "a man in the thick of every Jacobite rising of his day," who came into the property about 1690, also made many alterations, although to him more especially the laying out of the gardens is due. In politics he was a staunch Jacobite, and was privy purse to King James II., but on the misfortunes of his royal master he left the Court and retired to the seclusion of Levens. Since Colonel Grahme's time the additions to the building comprise a suite of bedrooms over the kitchens, and a long range of buildings at right angles to these, the latest of all being the tower at the angle, which forms so prominent a feature in all views of the Hall from the gardens.

Of these gardens it remains in conclusion to speak, forming as they do the chief work of Colonel Grahme. We have here a wonderfully perfect example of garden design in the latter part of the seventeenth century, though, perhaps, at first sight the fantastic forms of the Topiary work, hitherto unknown in England, appear a little overdone. And what an immense variety of forms in yew lie scattered at intervals before us; here a lion and crown, there an archway with its little tuft of yew acting as a keystone, now a huge umbrella—as that in our sketch—a lion, or a colossal helmet, whilst intermingled with, and forming a delightful contrast to the deep green of the yews, is a glorious display of varied coloured plants and gay flowers.

The gardens were designed and laid out by Beaumont, who, as a pupil of Le Notre, the great French gardener, was responsible for much of the garden work at Hampton Court. On the downfall of the King, Beaumont, whom Colonel Grahme had known at Court, was offered

IN THE GARDENS AT LEVENS HALL. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

employment at Levens. In the hall is Beaumont's portrait, who is thereon described as "gardener to King James II. and to Colonel James Grahme," and "to have laid out the gardens at Hampton Court Palace and at Levens." Along the principal walk we pass a large yew arbour shaped like a judge's wig, whilst further on, past an old sun-dial, we come to the large square bowling-green, with its thick beech hedges. In some old letters written at the latter part of the seventeenth century, allusion is made to the lime trees here, which appear to have been the first of their kind planted in England, introduced as they were from Holland by William III.

We are not permitted to leave Levens without first partaking of its ale, the manufacture of which is a family secret, and like the ale, of long standing; and whilst drinking, to join

to have taken the place of a former similar erection; much of the apparent black oak carving is of plaster work. The screen to the Great Hall at Penshurst, visited on the last A.A. excursion, is similar in this respect. The Domestic Chapel is now used as a sitting-room, but the ancient Piscina can still be discerned in the south wall.

The building was once quadrangular and moated; the evidence is clear that the kitchen and batteries were originally at the north end of the great hall. The high table was in a recess at the south end, with a fine cove and moulded rib over, the head and side posts of which remain. The two end doors leading off to the family apartments with finely-carved lintels are also left intact as well as the bay, which on plan forms part of a decagon. The Hall has at more than one period been used as

Tower, "the heart of Lancashire," standing out boldly against the sky on the top of a lofty hill. After a long and tedious ascent we pause under the entrance archway to drink in to its full the wonderful view opening out before us. Almost at our feet lies the great town of Preston, with its hundreds of tall chimneys emitting dark masses of smoke. The tower, which at first sight has more the appearance of a village, roughly speaking takes the form of the letter H, the bar marking the division of its two courtyards. The entrances to each court are in a direct line. On the south-east side is the main entrance, looking through which a delightful glimpse is obtained of the two courts. Well in front of the main gateway huge Jacobean gateposts stand out, rising from a low wall which divides the park from the forecourt.

HOUGHTON TOWER
H. INIGO TRIGGS :
AUGUST 4: 97 :

WITH THE A. A. IN LANCASHIRE.

in the time-honoured toast of "Luck to Levens whilst the Kent flows."

We now take our departure to a district some thirty miles south of Lancaster. The country round Preston is of a much busier type, the huge chimneys which appear on all sides largely detract from the beauties of an otherwise very pretty country. The road from Preston to Samlesbury Hall is very uninteresting, and on a hot day very tiring, and it is with much gratification that we at last see the old half-timbered building adjoining the high road, surrounded by a little copse which almost threatens to hide it from view. The entrance front, of which we publish a sketch, with the exception of a stone base, is entirely executed in half timber; the spaces between the upright beams and cross pieces are filled in with quatrefoils of wood, the centre portion of which is plaster. The porch, which looks like a modern addition, gives access to the Hall with a fine, though rudely carved staircase—a later addition. To the right a passage leads to the most interesting room of the house—the great hall, probably erected at the end of the fourteenth century; the roof has some immense oak timbers, and at one end is the minstrel gallery, which appears

an inn, doubtless owing to its proximity to the high road. In the time of Henry VIII. Samlesbury belonged to the Southworth family, whose name and arms are carved on the fire-place in the south-east wing, dated 1545, afterwards to the Braddylls, the Coopers, and to the present family of Harrisons. The Hall is now occupied by the Mayor of Blackburn.

From Samlesbury half an hour's run brings us to Blackburn, and from here we proceed to Houghton Tower, stopping on our way to see Livesay Hall, now partly occupied as a farmhouse, the unoccupied portion having been allowed to go terribly to ruin. We take some measurements of the remains of what was formerly a fine staircase. From the date panels the house appears to have been built in three different periods; the centre part bears the date 1608, the east wing 1666, and the west wing 1689. It was built by members of the Livesay family, from whom it takes its name, and was occupied by their descendants until the middle of the eighteenth century, when it was allowed to fall into its present state of decay.

A ride of some few miles brings us to the *mîe se de résistance* of the whole tour. A turn in the road reveals to our view Houghton

The main gateway is under a square battlemented tower of two stages, with a flank tower on each side, connected by walls. To the right on entering is a three-story building, part of which is now undergoing restoration; to the left are stables and offices. The court is divided by a quaint Jacobean terrace, with gate piers and fine wrought-iron gate, and a flight of steps admits to the second tower on the site of a former tall gatehouse, which was accidentally blown up during the Civil War, when through the inner gateway, immediately on Houghton underwent a long siege. Passing the left hand is the great hall, the entrance to which is through a low Tudor archway. Nearly the whole of this wall is taken up by a long window lighting the great hall and a large bay at the end. A curious feature, and one which occurs all over the building, is the manner in which the upper portions of the bay windows are corbelled out. We purpose giving next week some measured drawings of this portion of the building. In the centre of the courtyard is a lead statue of William III., brought from the neighbouring hall of Walton-le-dale, pulled down in 1834.

The hall is entered from the north side of the inner court by a flight of semi-circular

steps, a panelled oak screen runs along the width of the hall at the entrance, and above it is the Minstrel's Gallery. There is in this hall much old furniture of great interest. From the principal entrance the King's Staircase leads to the King's Reception Room, on the upper floor—a fine room, oak panelled—and a chamber known as the Guinea Room, from a number of gilt guineas decorating each corner of the panels of the wainscotting.

The general style of Houghton is severe, mouldings being sparingly used. There is little carving, the stone used being a very hard one, quarried from the hill on which the castle stands. The detail throughout is very well proportioned and simple, and it is very gratifying to note the spirit in which the restorations are being carried out.

The De Houghton family is of very ancient origin. The house, old as it is, is comparatively modern when we consider that the family has lived in this part of Lancashire since before the Norman era. Tradition says that their name came to them from the hill on which the Tower is situate. The founder of the Tower was Thomas Houghton, who succeeded his father in 1558. He changed the position of the old Manor House in building the present Tower. Perhaps the chief event in the history of Houghton is the visit of James I., in August, 1617. Accounts of the visit which are handed down to us show it to have been a very expensive matter for the then owner, Richard Houghton.

Considerable additions to the Tower buildings were made by Sir Charles Houghton in the days of William III. Soon after the death of Sir Charles the family deserted the Tower, and the buildings gradually fell into decay. Sir Henry Houghton, who came into the estates in 1862, did much to restore Houghton Tower. He died in 1876, and the work was carried on by Sir Charles de Houghton, under Messrs. Paley and Austin. At the present time the restorations are being carried out by Mr. Andrew Oliver for Sir James de Houghton.

Houghton Tower is the scene of many incidents depicted in Harrison Ainsworth's "Lancashire Witches," and is also the scene of Charles Dickens's "George Silverman's Explanation."

Furness Abbey, some distance from Lancaster, near the Town of Barrow, was the place next visited. The Abbey was originally founded in 1124 by Stephen, afterwards King of England, and, rapidly increasing in wealth, was worth at the dissolution £800 a year. The Abbey Church originally consisted of a short presbytery without aisles, central tower, north and south transepts, with eastern chapels, nave, and aisles. The presbytery was almost entirely rebuilt at the beginning of the fifteenth century. Of the nave little else remains but the stumps of the piers and the greater part of the outer wall of the south aisle. Nearly every period of English Gothic Architecture is represented, the entrance gateway and entire Church being of the transitional period, about 1160; the chapter house and fraternity about 1230; the Abbot's dwellings and gateway chapel about 1300; and the choir, west tower, sacristy, transept windows, and choir sedilia date from the beginning of the fifteenth century.

In the evening of Friday, according to the custom of all former excursions, a farewell dinner was held at the County Hotel, Lancaster, the headquarters of the tour.

THE workmen who are at present making alterations on the fine mansion house of Mellerstain, one day recently had to break through a partition wall, when they came upon a wine cellar, the existence of which was unknown, and which for some reason or other had been built up.

A PETITION having been presented to the Glasgow Dean of Guild Court to have the spire of St. Enoch's Church, Glasgow, which was struck by lightning, examined by an expert builder, an inspection of the Church was made recently by Mr. Whyte, the Master of Works, and Mr. George Barlas. Mr. Whyte is of opinion that 20ft. or 30ft. of the spire will have to be taken down.

GLASTONBURY ABBEY.

COMPARATIVELY few people visit Wells

Cathedral, one of the finest of our great mother Churches, because of its inaccessibility, and still fewer the ruined Abbey of Glastonbury, so bound up with our national history. The recent pilgrimage of the Fathers of the Lambeth Conference to this ruined shrine will recall attention to its chequered history. Three fragments of that once great building stand within forty acres of ground—a remnant of the Lady Chapel, or, as it used to be called in the fifteenth century, the Chapel of St. Joseph of Arimathea, who, tradition says, preached the Gospel here; the ruins of the great Church; and the great kitchen of the Abbots. Malmesbury claims King Arthur as the first benefactor, but, however that may be, there is a distinct record of a grant of five hides of land at Inysvitrin, given in 601 by Gwrgan, King of Dyfuaint. In the next century King Ina gave a grant of land at Brent Knole and Merch, and gifts from that time were continuous, and St. Dunstan's great influence as Abbot eventually

DREW ATTENTION TO THE ABBEY.

The two Royal Eadmonds and the great Eadgar were among the many people of note buried in the Church, and Archbishops and other distinguished persons in early days frequently visited the Abbey, though we have little information as to the monastic buildings

during the English period, but the Conquest brought over great Church builders, such as Thurstan, the first Abbot, who apparently pulled down Ina's Church and began a larger one; while in the twelfth century, Herlewin, in turn, pulled down that Church and erected another; while during the time Henry of Blois, a nephew of Henry I., was Abbot, the conventional chambers were rebuilt, and a Royal palace, a chapter house and cloister, an infirmary with chapel, and an external gateway, were added. In 1184 the whole monastery was destroyed by fire, but the damage done was at once repaired by Henry II., who held the temporalities, and Ralf FitzStephen commenced the work of restoration. The Lady Chapel—the charming fragment of which still remains—was consecrated in July, 1186, but the great Church was not finished till the time of Abbot Geoffrey de Fromond, about 1315. Then, when all was finished, the remains of

THE GREAT AND CHERISHED HEROES,

such as King Eadmund I., King Arthur, Ironside, and Eadgar, were deposited there. An interesting article in the Guardian says: "Joseph of Arimathea was said to be buried at the west, in the passage or ante-chapel leading to the Lady Chapel." The Abbey estates comprised at one time nearly an eighth of the whole county of Somerset, including more than forty parishes, of which East Brent, famous in our own times, was one. In Wiltshire there were sixteen manors, in

WITH THE A. A. IN LANCASHIRE. FURNESS ABBEY. FROM A PHOTOGRAPH BY F. TURNER, MORECAMBE.

Dorset six, and in Devonshire and Berkshire one each, besides revenues derived from pensions from eighteen Churches or their manors. At the time of the Domesday survey a twelfth of the population of the county were tenants or serfs of the Abbey. There appear to have been from fifty to a hundred monks, besides villein tenants, cottagers, serfs, and beggars innumerable. In 1349 the Black Death reduced the monks from eighty to thirty-four, and in 1524 we find forty-seven monks requesting Cardinal Wolsey to confirm Richard Whiting as Abbot, and at the dissolution in 1539 there were forty-nine monks. The increase of luxury before the Dissolution is shown by the fact that the butlership, which had become hereditary, was vested in a girl who became the ward of the Prior, and the Abbot, who lived at some of the splendid manor houses in the neighbourhood, was served at table by more than 300 attendants, many the sons of gentlemen, and that 500 horses were in the stables, while the Almonry was crowded with beggars. As modern prelates from all parts of the world walk in the streets of Glastonbury, they will note with interest the remains of the domestic architecture of the fifteenth and sixteenth centuries; will lament the loss of the library, which was the admiration of the antiquarian Leland, and will reflect possibly on the vanishing character of the greatest works alike of Art and charity.

THE members of the British Archæological Association have decided to visit North Wales at the end of the present month.

It is stated that Muckross Estate, Killarney, has been selected as a site for a Royal residence, and that a substantial sum has been offered for the property.

MR. W. H. BARBER, of Henley-on-Thames, has offered to present to the City of Birmingham a statue of the Queen, by Mr. Thomas Brock, costing £1000. The offer has been accepted by the City Council, and a site for the statue is to be selected by the Public Works Committee.

WE understand that the memorial bust of the late Lord Derby, which Earl Stanhope has just offered to the Select Committee on the House of Lords offices, will be placed in one of the apartments of the library. In order to do this certain alterations will be necessary, and it is improbable therefore that the bust will be placed in position until next Session. The memorial will be mounted in conformity with those of the Queen, Lord Brougham, and Lord Truro.

SWANSEA NEW PARISH CHURCH.

THE nave of St. Mary's Parish Church, Swansea, has been opened. The old nave and the aisles were built in 1745, but the chancel and the Herbert Chapel are parts of the original Early English edifice, most of which fell to the ground in 1739, while it was undergoing repair. While the building, which is now in course of reconstruction was, from an Architectural point of view, of very ordinary description, there are parts of its interior of great interest. The chapel contains the handsome tomb of Sir Matthew Cradock and his wife, Lady Katherine Gordon. This knight was chancellor of Glamorgan, and steward of Gower and Kilvey, and his lady was the widow of Perkin Warbeck, the Pretender, who was hanged at Tyburn in the reign of Henry VII. In the north wall of the chancel is a fine memorial brass, which was once the upper portion of an altar tomb erected to the memory of Sir Hugh Johnys, his wife (Dame Maud), and their five sons and four daughters. Sir Hugh, who was a great-grandson of Sir Roger Vaughan, fought in the Crusades, and was knighted at the Holy Sepulchre in 1441. The Church also contains a valuable altar piece, in the shape of a painting of the Madonna and Child, which is attributed to Sassoferrato, an Artist, who died in 1598. Sir Arthur Blomfield has prepared plans which it will cost at least £25,000 to realise. The nave has cost £14,000. The new Church is built in the Early-pointed style, faced externally with local stone, with Bath-stone dressings, and internally entirely with Bath stone. - It has a lofty nave arcade, with attached stone shafts carried up to the roof, and supporting the principal rafters. The whole of the roofs are constructed of English oak, with some chestnut, covered with the best Westmoreland slates. The internal dimensions of the new nave and aisles are as follows:—Length, 111ft. 6in.; width, 66ft.; height to wall-plate, 40ft.; and to ridge, 62ft. This is an addition upon the old nave of 33ft. in length, 6ft. in width, and 22ft. in height. The chancel will be built in the same style as the nave, with spacious vestries and a lofty tower, 30ft. higher, in which will be rebuilt the existing corbels under the parapet of the present one. The stained-glass window in the chancel, and the canopy and effigy will also be preserved and re-erected. It is also intended to restore the Herbert Chapel; the arch leading from this to the new north aisle is the ancient one rebuilt. The floor of the new nave has been laid 2ft. 6in. above the old floor, and the

ground outside in the yard has been raised accordingly. This has effected a great improvement both in and outside the Church. Also the very dull and heavy high wall enclosing the north-east corner of the yard in Calvert Street has been lowered four or five feet, and the ground sloped down. This throws open the Church much more to public view, and has greatly improved the locality. The principal carving, which has been done by Nicholls, of Lambeth, consists of our Lord in majesty on the vesica over the south porch door, and of our Lord and the four Evangelists over the west porch. Mr. Nicholls has also carved the foliage round the handsome pulpit presented by the lay rector, Sir R. A. Morris, in memory of his late father and mother. The Church is lighted with gas incandescents, and the fittings have been supplied by Mr. Legg, of Nelson Street. The Church is seated with chairs.

ACCORDING to the designs of Mr. Charles Bell, of Salters' Hall Court, a block of shops and warehouses is now in course of erection at 178 and 182, Goswell Road.

MR. J. RANDALL VINING, of 89, Chancery Lane, has been engaged as the Architect for the rebuilding of premises at 99, 4, and 88, High Street, Marylebone, at a respective cost of £1743, £1695, and £1993.

THE floating stone is one of the wonders of Corea that travellers have spoken much and often about. The stone is of great bulk, and shaped like an irregular cube. To all appearance it is resting on the ground, and is perfectly free from support on any side. If two men, standing at opposite ends of it, hold each the opposite end of a thread, they will be able to pass the thread under the stone without encountering any obstacle. The natives consider it one of the greatest wonders of their land, and have erected a temple in its honour, known as the Fon Shih Miao.

THE Liverpool Corporation having municipalised the tramways of that city, to take effect on Sept. 1st, has resolved to equip a line of tramway, as an experiment, to be worked by the trolley or overhead system of electric propulsion, at a cost not exceeding £50,000. The new line will start from the centre of the city, and run south, being about four miles long. The cars will closely resemble American, all on one floor, with a portion open at one end for smokers and outside passengers. The iron columns to carry the electric current will be utilised for illuminating the streets by electricity.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

August 18th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

Yet another cloud has appeared upon the artistic horizon. There is hardly a studio in which some project for a Jubilee picture is not

says:—"A serious loss threatens the inhabitants of Hampstead. The speculative builder has now got his eye on Church Row, and is anxious to destroy what is undoubtedly the most beautiful old street to be found in London or the neighbourhood. There are, I believe, three schemes in contemplation. Two of these deal with buildings on the north side; the third (and most disastrous) proposes to fill the space occupied by No. 16 and the intervening area up to the churchyard with "mansions." Church Row, with the exception of the building at the corner next Heath Street, is a perfect example of eighteenth century street Architecture, and there can be no need to dwell on its increasing value to all intelligent people, in view of the character of recent building in Fognal and elsewhere in Hampstead. The point, however, to which attention should be drawn is, that, while the speculative builder may or may not be enriching himself by his abominable buildings, the value of residential property in Hampstead is being steadily reduced by the persistent destruction of all that makes the place attractive. To the speculative builder, provided he floats his speculation, this is immaterial. The State can do nothing in such cases, even if its interference would be desirable, and public opinion is unfortunately

a Jesse window with kneeling figures of English Sovereigns at the foot, one of the figures being that of Queen Victoria.

At Bebington the venerable Church, which contains some of the most ancient and beautiful Architectural work in Wirral, ranging from the earliest to the latest dates of English building, is now undergoing a complete renovation, which is much needed. Some previous restorations made in 1845 not being of a material consistent with present ideas, though well designed in themselves, will be swept away, and a series of decorative wooden arches substituted. The ancient roofs of the Church and aisles are to be covered with pitch-pine boards instead of the original plaster, and decorated with ornamental details. The walls of the interior of the nave will be stripped of plastering, and the rude rubble stonework neatly pointed, with mortar joints, which will afford a striking contrast to the refined and highly-finished work in the chancel. These alterations will completely transform the appearance of the ancient building, and we cannot help regretting that its antique appearance will be to some extent lost, and new work will not be identical with any old that has hitherto existed.

LIVESAY MAIL
H. INIGO TRIGGS AUG 97.

WITH THE A. A. IN LANCASHIRE. SKETCHED BY H. I. TRIGGS.

on the easel, and the Royal Academy next year promises to be one continuous array of processions. And here, within a month of the event, every music-hall and Art gallery, whether in London or the country, offers a panorama of the event which must nauseate the public palate as much as it jades the eye. Jubilee pictures, unless they are something very exceptional, will be as great a failure as Jubilee seats.

SOME indignation has been caused at Hampstead by the news that there are two or three schemes in existence, and on the eve of being carried out, for the destruction of the fine old street known as Church Row, which is undoubtedly the most beautiful old street to be found in London or neighbourhood—a perfect example of eighteenth century street Architecture. The object of the contemplated demolition of some of the fine old houses there is said to be to erect flats.

MR. REGINALD BLOMFIELD, writing to a contemporary on the subject of Church Row,

not sufficiently advanced, or rather is too loose, to offer any effective check. The only remedy is for those immediately interested to combine in an endeavour to preserve buildings which can never be replaced."

IN the beautiful Lady Chapel of Winchester Cathedral, the south window, in memory of Anthony Wilson Thorold, the eighty-fourth bishop of the diocese, was unveiled recently by the Dean of Winchester. Mr. C. E. Kempe has been very happy in depicting scenes of our Lord's life in connection with the Blessed Virgin, while there are also representations—the old glass being worked in wherever possible—of SS. Jerome, Ambrose, Gregory, Augustine, Elizabeth, Margaret, Birinus, Honorius, Swithin, and Alphege. Above these are St. Anthony, the Venerable Bede, St. Christopher Kynegils (the first Christian King of Wessex), Bishop Fox, Henry VII., and Prince Arthur. The other windows are to be filled with stained glass. The east window will be one of the city's permanent memorials of the Jubilee, and Mr. Kempe has designed for this purpose

The very inadequate courts in the Old Bailey have long been doomed, but the day when they will be replaced by a building which shall be worthy of the leading city of the Empire seems as far off as ever. The Central Criminal Court ought to be architecturally, as it has long been from a legal point of view, an example to the whole nation. As it is, almost any provincial municipal town possesses Courts better designed and equipped. Some years ago it was decided to build a new Court on the Embankment, but that plan was abandoned in favour of erecting a new structure on the present historic site. The judges, and particularly Mr. Justice Wills and Mr. Justice Grantham, have objected to certain plans put before them by the City Lands Committee, on which it was proposed to expend something near £200,000. The objection of the judges to the scheme is understood to be prompted by the awkwardness of approach and the confined area of the existing site. There is a proposal to use the present Christ's Hospital for the purpose, and more may be heard of this on the removal of the scholars to the new premises.

GLASGOW has always been more Frenchified in matters of Art than any other city in Great Britain; and it is not surprising therefore to hear that the Architects of the Art Galleries, which are approaching completion, are about to adopt the same method as was done in the case of the *Hôtel de Ville*, Paris, and employ a master sculptor to model the designs for all the decorations and be responsible for their proper execution, reserving only a few special points for his own personal execution. Mr. George Frampton has been selected as master sculptor, and he is given a free hand as to his subordinates—as large a proportion as possible being Glasgow craftsmen, provided that they are competent.

MR. FRANK DICKSEE, R.A., who is to illustrate the "Queen's Letter to Her People," is one of the younger of the Academicians, who received the distinction of being elected an Associate of the Royal Academy when he was but twenty-eight. The first picture he exhibited at Burlington House was a Scriptural subject, but it was his "Harmony" which brought him into prominence. This work was purchased by the Chantrey Bequest in 1877 for £367 10s. As an illustrator Mr. Dicksee has been very successful, and he has also accomplished designs for stained glass. Of late years he has been what might be described as a painter of sentiment; but this spring his large canvas for Burlington House showed him working on classical lines, and his "Dawn" held a place often previously occupied by the late Lord Leighton's pictures.

How much it may be owing to the recent rapid growth of technical schools it is impossible to say; but there can be no question that the Art of wood-carving is one which is growing in popularity with women workers. Until somewhat recently easy opportunity was not offered for them to acquire this Art, although as long ago as 1879 a school of wood-carving for women was founded; and even before that time Mr. W. G. Rogers, a well-known wood-carver, gave lessons to ladies; but in those days women had not begun to study the possibilities of wood-carving as anything but a pleasant employment for spare time. To-day they make it both an occupation and recreation.

AMONG the newly discovered marine resorts on the Norfolk coast, Mundesley looms large. As an instance, the current number of the *Quiver* gives a picture of Mundesley Church, which it describes as "Doomed to the Sea." The writer remarks: "On the edge of a rapidly wasting cliff at Mundesley, overlooking the North Sea, a half-ruined Church stands, almost roofless, except for a small portion of the nave where service is still regularly held. Many years ago these few crumbling walls formed part of a fair Church in a populous district, many acres of which are now under the waves. The country inland has been in great part deserted, and but few hands are now clasped in prayer in the old Church, and the psalm of praise rises faintly on the sea breeze. One day it will sound for the last time, for the tottering walls with the rampart on which they stand will soon be swept into the great sea." Local opinion will doubtless regard the writer's view as too gloomy to be true, for the old Church stands in no immediate danger. The increasing requirements of a growing population, however, have started a movement for a new Church, or for the restoration of the venerable fabric which stands out so boldly opposite the new railway station. Many buildings at Mundesley stand nearer the cliffs than the ancient Church; and it may safely be said that the day of its collapse need not be expected for half a century, if at all. Here is sweet consolation for the nervous parishioners and the most regular of Church-goers.

SIR HENRY PARKES, when he was alive and in power in Sydney, beautified that city with a number of statues, and gave lordly commissions out of the public funds to his special friend and favourite, Woolner, and other English sculptors. His own statue is now to be erected in the city of his adoption in a very

singular and shabby style. It seems that a once wealthy admirer of Sir Henry ordered a statue of the statesman for his own private satisfaction, and secured it at a cost of £1500. Times having changed, and ready cash being desirable, he has now offered it to the Government for £100, and the offer has been accepted.

DR. SYMES THOMPSON has given an account of a tomb lately uncovered at Ephesus, which, it appears, is probably the tomb of St. Luke, the patron saint of the guild. The tomb was discovered ten years ago by Mr. Wood, but has recently been further explored. The character of the tomb is that of a central building, supported by pillars, with a dome, which originally had a capped top, and in the centre of this domed edifice is the tomb. Around this central enclosure was formerly a paved court, 150ft. in diameter, and in this court a large number of Christians appear to have been buried, evidently with the desire of being near the Holy relics. At the entrance of the tomb there is a cross—a Christian emblem—together with a bull, the emblem of St. Luke. Among the fragmentary remains of the tomb there is a large number of fragments of pillars.

A FRENCH artist in-faience, who has come over here to study the best English china of to-day, is surprised not to be able to find examples of it either in our museums or in our shop windows. He says that in the Museum of the Arts Décoratifs in Paris, or even in the shops, he has been able to learn more of what is being done than he could anywhere in London. Craftsmen in Paris can always rely on the Government seconding their efforts, where the results are good; the contrary would appear to be the case here.

On the river Caldew, and within a short distance of the historic City of Carlisle, lies the modest village of Dalston, which takes its name after the family that were for centuries the owners of the soil hereabouts. The Dalstons had for their seat the ancient castellated building, of fifteenth century erection, which nestles in the beautiful vale of the Caldew, and now occupied as a farmhouse. This old house, together with the adjoining estate of 1562 acres, and the manorial rights of Little Dalston, was offered to auction at the County Hotel, Carlisle, a few days ago. The estate comprises seven farms, the pleasant old village green, seventeen cottages, a licensed inn, two mills on the Caldew, and all rights of fishing in that stream.

SOME wonderful caves were discovered recently at a place called Sterkfontein, some eight miles to the north-west of Krugersdorp, in the South African Republic. Limestone had been quarried for some months in a small kopje, and after an explosion during some blasting operations a cavity of great depth was left. A long rope was secured, and a party descended, and it was found that they had driven through the roof of one of the largest of a series of magnificent caves. The spectacle was one of great beauty, the lights carried by the explorers being reflected from thousands of stalactites on every hand. The further the party proceeded the more beautiful the crystal formations became, some shaped like wreaths of roses and huge floral bouquets. The caverns, which have not yet been one half explored, seem to run in tiers down to a depth of 150ft.

VIENNA has suffered a disaster which, within a few hours, caused most serious damage to the extensive buildings of the proposed City Railway. The small river which gives "Wien" its name was swollen by a rainfall of seventy-two consecutive hours to a wild torrent. In the bed of this usually dry river a line of the City Railway is being built, which will be flanked by quay walls, while the river is to be covered over by a sort of arched roof, on which streets and houses are to be placed. The river-bed has been the scene of three years' hard work. A narrow-gauged railway ran into it for transporting the necessary material

for the works; one of the future quay walls was nearly complete, wooden bridges of great solidity had been built, and light bridges for the workmen had been thrown across the river in twenty places. All the framework, the bridges, and the railway were washed away by the flood during the night. Even the stone foundations and walls suffered seriously, and all the work must be done over again. The real danger to the city was that the thousands of rafters borne down by the rushing water upon six miles of river accumulated in front of the bridges which span the Wien at short distances from each other, and it was feared that one or more of them would break down.

AN effort is being made by a number of residents in the district to save the wooden gate of the churchyard near Drury Lane, through the iron bars of which Poor Joe showed Lady Deadlock the last resting-place of his singular and single friend Nemo. A faculty was recently granted, which will enable the old Golgotha to be turned into a street, and, as the gate has long been a veritable Mecca to Americans and lovers of Dickens in all parts of the world, it was felt that some effort should be made to save it from destruction, and preserve it by placing it in some convenient site in the neighbourhood. The question of expense is not likely to prove a stumbling block, as the value of the door for firewood and old iron cannot exceed a few shillings; while it is hoped that it may be possible to fix it, with a suitable inscription, in some part of the new parish-house which is being erected in the neighbouring Clare Market for the use of St. Clement Danes, with which parish the whole of "Bleak House" is so closely identified. The churchyard itself has practically already ceased to exist, so entirely have the surroundings been demolished, but the gate is still hanging on its rusty hinges.

RECENT Art concessions in London make one reflect with considerable regret on how very little is being done in the capital city of Ireland for the fostering and encouraging of Art either by the Government or by individuals. The National Gallery of Ireland is practically the only public collection of pictures in the country. It was started half a century ago by a gift of some £5000 from the Dargan Memorial Committee; and the Trustees have, with their slender Government grant of £1000 a year, endeavoured to form a collection of works of Art which should be worthy to rank with those of other capitals. So rapid has the progress of the gallery been of late years that the present building in Merrion Square is now too small for the collection; and, as is well known to those familiar with its walls, there is no room for further additions. If any expansion of the collection of portraits is to take place a new wing will have to be added to the present building.

M. ARSÈNE ALEXANDRE has some very severe things to say of the English School as represented in the Louvre. The occasion is the recent purchase by the Louvre of Romney's portrait of "a certain John Morley," to which we referred recently. The chief characteristic of the canvas is that it conveys no idea whatever of Romney, while the one thing that can be urged in its defence is that it is large and cheap. But with the 9000 francs which it cost, a good deal may sometimes be done, and M. Alexandre is prepared to prove that the Louvre Administration allowed a Corot to slip through its fingers a few years ago, which would not have cost very much more. To the plea that the Louvre is poor, he replies that, with the Lawrence bought last year, it has lately spent nearly 100,000 francs on the English section without making that section appreciably more valuable. This, in his opinion, is not poverty, but prodigality. He would have not only Romney represented, but also Reynolds and Gainsborough, Crome and Turner, Constable and Hogarth. But rather than spend money, however little, in giving the French public a totally erroneous idea of the English School, M. Alexandre thinks it would be much better for the Louvre to do without an English section at all,

No fewer than 115 projects for an attraction of an extraordinary nature at the Paris Exhibition to be held in the year 1900 were brought up for consideration at the meeting of the committee recently. They included a proposal to build a glass under-water restaurant, and another for two immense mirrors to be attached to the Eiffel Tower, one at the top and the other at the bottom, so that people promenading round the lower should see a reflection of nearly the whole of Paris. Another suggestion was to erect a memorial temple of present-century progress with representations of the eight great nations of Europe. A fantastic inventor submitted an idea for the erection of a model town of the future, in the year 2000, or some such advanced period. A doctor urged the construction of a miniature hygienic city, to be built on the most advanced and perfect hygienic principles, and inhabited by people living in strict accordance with the laws of hygiene. A startling proposal was that a house 600ft. high should be erected in order to show how tall a habitable building could be made without danger.

The report presented by Mr. Alexander Williams, as to the way in which Messrs. Nairn and Son had carried out the work of restoring the Mansion House pictures, Dublin, is certainly interesting. The portrait of the Right Hon. Speaker Foster, before it had been cleaned, showed traces of having been barbarously treated, and there were signs that the picture had been repainted and worked over more than once. When he last examined the picture he was agreeably surprised to find that Messrs. Nairn had succeeded in removing all the old varnishings and discoloured repaintings, and had got down to the original painting by the Artist. The separate parts had been placed together, so that the damages were almost obliterated, and the canvas had been made to assume its former flat appearance. The portraits of Sir Wm. Alexander, the Earl of Hardwicke, and Sir Daniel Bellingham, first Lord Mayor of Dublin, were almost in as bad a state, and all have been successfully restored.

TOWARDS the close of the year 1844 some workmen who were employed repairing the wall of a house in Marseilles, the ancient Massilia, came upon a stone upon which they discovered some very curious writing. They reported the matter to their employers, who had the slab examined by experts. It was then found to be a valuable Phœnician inscription of the second or third century before the Christian era. The stone was removed to the Marseilles Museum, where it remained in obscurity until a year or so ago, when the Rev. James Macdonald, of Oxford, undertook to make a thorough examination of the inscription, the results of which have just been published under the title of "Massilia-Carthago Sacrifice Tablets (D. Nutt, London, 8d.), 1897." From this publication we learn that the tablet is inscribed in the Phœnician language, with the order of sacrifice to be observed in the Temple of Baal-Tzephon. It is curious to note that this is the very deity mentioned in Exodus xiv., 2, who had a small temple on Mount Cassius, and who was one of the many Baals worshipped by the Phœnicians. In language the inscription is very similar to that of the Moabite Stone in the Louvre Museum, and the order and specifications of sacrifice correspond closely with the teachings of Leviticus.

MR. CHAMBERLAIN, replying to a correspondent's inquiries regarding provisions of the Workmen's (Compensation for Accidents) Bill, says: "The provisions of the Bill will apply to all buildings in process of demolition, to all buildings which are being constructed with the help of steam or any mechanical power, and also to buildings which are over 30ft. high. The definition is taken from the Factory Acts, and will include the great majority of all the accidents which occur in the trade, while at the same time it is intended to relieve from liability the very small builder, who is often no better off than his own workmen."

SPEAKING of the tall tendencies of the Americans as regards their public buildings, a writer in Pearson's Magazine says:—"I doubt whether anywhere in the world there is such a magnificent entrance hall as that in which you find yourself as you enter the building of the Metropolitan Life Insurance Company of New York. It is a fairy palace of white and coloured marble. So wonderful is the beauty and so impressive the majesty, that you feel you must raise your hat and tread on tip-toe as you walk over the glistening floor. In many of these buildings there will be a dozen or more elevators running from early in the morning till late at night. With so many passengers and such a number of stories, they have to be worked on a system like railway trains, the express lifts not stopping until a certain floor is reached. A vast mechanical plant is required to supply the power for these elevators, and to provide the entire building with light and heat. Even the porters and lift attendants do not know the names of half the smaller tenants which are registered in gold letters on a black background in a gigantic glass frame measuring 15ft. or 20ft. in height. To facilitate the work of finding the office you require, the numbers of the rooms on each floor begin with a new hundred, so that even if there happened to be only eighty-eight rooms on the third floor, the first office on the fourth floor would be numbered 400. To some buildings a post office is attached; the vaults are filled with fireproof safes, while such small matters as barbers' shops and boot-cleaning parlours are quite essential as part of each aerial city. The Ivins Syndicate building is perhaps the monarch of New York sky-scrapers. It is twenty-nine stories high, covering an area of nearly 15,000 square feet. The cornice of the towers is 386ft. above the level of the street, and, the foundations extending 34ft. below the ground, the total height of the structure is 420ft. The total dead and live load is 50,000 tons! Fifteen thousand feet is a very large space indeed, when you remember that on the business end of Broadway land is worth from £270 to £540 a square yard. No wonder that people prefer to live one above the other instead of side by side; no wonder that where one-story shanties were allowed to stand a few years ago there are now these Jack-and-the-beanstalk edifices, the tops of which you cannot see without almost breaking the back of your neck."

CONSIDERABLE local feeling is being engendered at Twickenham by the action of the workmen of the Duke of Orleans, who are engaged in overhauling York House, where His Royal Highness has expressed his intention of taking up his residence shortly. Visitors to Twickenham will remember that the road from the Parish Church, past the river front of York House, bisects the grounds. On the riverside there is a pretty lawn, and the low hedge which existed there allowed one of the most charming scenes of the island, the ferry, and the Ham fields, to be viewed from the road. Within the last few days the workmen have grubbed up the hedge and commenced to put up a brick wall, which is to be of such a height as to entirely block out the view of the river for a considerable distance, and thus destroy one of the most picturesque spots in Twickenham.

FORTUNATELY the decision of the Italian Government to purchase, for the sum of £240,000, the famous Borghese collection, averts, the danger, which was at one time imminent, of this splendid array of Art treasures being dispersed; and the acquisition by the City of Rome of the palace in which the collection is housed ensures the preservation of the building and its contents without any alteration. As among the pictures there are such notable works as Raphael's "Entombment," Titian's "Sacred and Profane Love," Correggio's "Dane," and many others by the greatest Italian artists, collected with admirable judgment, the loss to the Italian nation which would have resulted from an open sale would have been lamentable.

In the vicinity of Saltash are three of the most interesting castles in the West. Trematon Castle, near the Lynher Creek, has been modernised, but contains portions of the building which, so far back as the Conquest, fell to the share of Robert of Mortain, half-brother of William the Conqueror. It was afterwards held by the Valletorts, and the Black Prince subsequently gave it for life to Sir Nigel Loring, his companion in arms during the French wars. Ince Castle, also near the Lynher, can show very little of its former splendour when it was the abode of the notorious John Killigrew. Pentillie Castle has been greatly modernised, and is interesting from the fact that behind it, on a well-wooded hill, stood an old tower, in which Sir J. Tillie, a former owner, who died in 1712, left instructions that he should be placed, after death, in this tower, seated in his customary dress, before a table furnished with wine, pipes, and tobacco. His wishes were not carried out, but he was buried in his favourite tower.

DURING the construction of the Grand Central Railway the officials who are conducting the geological surveys of the country have taken every opportunity of examining the sections of strata laid bare. Mr. Woodward, Mr. Fox-Strangeways, and Mr. Reid have made careful examination of the cuttings between Baker Street and West Hampstead, and between Quainton Road, Aylesbury, and Annersley, but the result of their examination has not yet been made public, and it is not expected for some time. The earthworks, extending from Rugby to Quainton Road, are now almost completed; indeed, the work upon the southern division is in a very advanced state. Only one viaduct—that at Catesby—remains to be finished, and this is now approaching completion. The brickwork of the tunnel, which is some 3000 yards in length, has already been finished.

ANOTHER exquisitely foolish suggestion has been made that a law shall be passed to forbid American painters going abroad, so that an Art may be secured which shall be truly American. Of course, the only result of such an enactment would be that every American student possessed of either capacity or ambition would fly from the country where his fetters would weigh upon him so heavily; and the residue of incapable daubers would establish a truly American Art that would be the laughing stock of the world. The reason advanced for this astonishing suggestion is that American Artists who go abroad get foreign ideas and learn foreign methods, so that, in spite of the tax levied in the interest of American Art, what is brought back to America is a transplanted foreign Art. As the whole reputation of America as an artistic nation is supported by men like Mr. Whistler, Mr. Sargent, Mr. Boughton, and Mr. Abbey, who have, most fortunately, not trusted to native advantages for the perfecting of their skill, this objection to foreign study is sufficiently quaint.

THE argument of some of the American papers in defence of the imposition of a 30 per cent. duty on works of Art imported into that country is amusing in its utter misconception of the real needs of a National Art School. It reveals a condition of opinion with regard to artistic questions that is quite enough to account for the failure of the native school in America to take the position which, judging by the achievements of its Artists who have settled in other countries, ought to have been well within its reach. When Art is looked upon merely as a local industry, whose only chance of existence is to be found in its careful protection from all outside competition, and when it is openly pleaded that the only possible way of establishing an American Art is by compelling the American people to buy the pictures painted by their own Artists, we may safely conclude that a vast array of the lowest kind of mediocrity will be all that America will be able to contribute to the Art of the world. It is curious how the practical person fails to understand that a National School is

not a local affair, but the result of an intimate acquaintance with what has been done by the greatest Artists in other countries.

A PICTURE with rather a curious history has just been acquired by the French Government and placed in the Luxembourg. It is a "Raising of Lazarus," which during its recent exhibition in the Salon attracted a great amount of attention. The Artist who painted it, Mr. Henry Tanner, is an American negro, the son of an African missionary, and he has received his artistic education in the studio of M. Benjamin Constant. Pictorial ability in men of his race is somewhat rare; but Mr. Tanner, not only in this latest success, but in many other clever pictures as well, has proved himself to be an artist of distinct power.

THE awards of the examiners in the national competition of Schools of Science and Art have just been published. The number of works sent up for examination were as follows:—50,255 from 281 Schools of Art and branch schools, 35,560 from 298 science schools, and 11,796 from 449 Art classes. Of these 5853 were selected for national competition. Sixteen gold medals, 94 silver medals, 255 bronze medals, and 510 prizes of books have been awarded, in addition to awards made to students at the Royal College of Art. The Birmingham Municipal School of Art holds its place at the head of the list in respect of the number of awards obtained, and these include three gold, three silver, and seventeen bronze medals. The following table gives a comparison of results at the principal schools:—

	Gold medals.	Silver medals.	Bronze medals.	Book prizes.	Total awards.
Birmingham	3	3	17	38	61
Glasgow	3	3	23	23	57
Leeds	—	2	9	20	31
Leicester	1	3	11	14	29
Nottingham	1	2	6	14	23
S. Kensington	1	1	6	15	23

The Birmingham winners of medals are as follows:—Gold medal: W. Haywood, measured drawings of Architecture; O. Scattergood, design for tapestry (the Princess of Wales' scholarship of £11 was awarded to this student); J. A. Swan, design for provincial market. Silver medals: Edith A. Cowell, modelled design for casket; W. Haywood, design for a fountain; Violet M. Holden, figure design. Bronze medals: Ethel M. Child, M. Clarke, Ethel I. Cook (two), Lily G. Dale, Elsie Gray, Evelyn Holden, A. R. Holloway, G. W. Hughes, Florence A. Marriott, Martha A. Onions, Edward J. Sims, F. T. Thomas, C. K. Thompson, Effie D. Ward, Eleanor L. Ward, Ernest E. Toy. Among other schools obtaining awards are the following:—Cardiff, one silver medal (C. Holland), one bronze medal, and five book prizes; Derby, two silver medals (W. H. Meggs and W. H. Tomlinson) and five book prizes; Hanley, three silver medals (G. Cartledge, two, and F. Harper) and one bronze medal (H. Hammersley); Rugby, one silver medal (A. E. Martin), two bronze medals (A. E. Martin and J. J. K. Phillips), and five book prizes; Stoke-on-Trent, one silver medal (A. H. Longmore) and three book prizes; Tunstall, one silver medal (A. Critchlow) and one book prize; West Bromwich, two silver medals (Annie M. Clay and H. Green), two bronze medals (Florence A. Birch and M. Theckla Pearce), and nine book prizes; Wolverhampton, one silver medal (A. J. Hardman), three bronze medals (H. Whitcomb, G. Wootton, and Mary H. Wright), and eight book prizes; Burslem, two bronze medals (Florence Henshall and W. Sambrook), and two book prizes; Coalbrookdale, two bronze medals (Cecil Jones) and two book prizes; Coventry, one bronze medal (D. Anderson); Dudley, one bronze medal (S. R. Birks) and one book prize; Handsworth, one bronze medal (Annie Fellows) and one book prize; Stourbridge, one bronze medal (Edith H. Webb) and two book prizes; Wordsley, one bronze medal (C. J. Carder); Worcester, two book prizes; Cheltenham, Gloucester, Kidderminster, Longton, Leek, Newcastle-under-Lyme, Oldbury, and Shrewsbury, each one national book prize.

PARISIANS have been somewhat amused by

the announcement that the piercing is about to be terminated of the artesian well of the Butte-aux-Cailles. The reason is that it is now more than thirty years ago that a precisely similar announcement appeared in the papers, and from that day to this the promise has never been fulfilled. The well in question is one of four whose construction was planned as far back as 1833 by Arajo, the famous scientist, who maintained that Paris could obtain all the water that it wanted from its subsoil. These hopes have not been realised, but the artesian well at Passy still yields a sufficient volume of water to keep the artificial rivers in the Bois de Boulogne running. The piercing of Butte-aux-Cailles well has encountered all sort of difficulties, but they have now been surmounted, and the engineers prophesy for an early date a daily yield of 10,000 cubic metres of tepid water. But Parisians have learnt to be sceptical in the matter, and the promised creation of a monster bathing establishment will not be believed in until it is seen.

THE Euston Barracks at Fleetwood, which were recently sold by auction for £15,000 to Messrs. Cardwell, Thompson, and Gardner, of the Whittle Springs Brewery, Chorley, have passed through many vicissitudes. Built about half a century ago, the property, which is in the form of a crescent, with a frontage to the sea of about 300ft., was originally known as the North Euston Hotel, the idea of its founders being to make Fleetwood a fashionable watering-place. Many titled personages stayed there in those days; but misfortune came upon the town, and in 1859 the hotel was purchased by Government and converted into a school of musketry, quarters being provided for about sixty officers and a staff of military instructors. Subsequently other buildings were added, and the structure converted into barracks, for which purpose it continued to be used until comparatively recent years. Recently it passed into private hands, and now there seems a probability of an effort being made to transform it to its original object.

WITH reference to the Parliament Street Improvement Scheme, a correspondent writes:—"The tenants in this street, who are compelled to quit at Michaelmas in view of the public improvement scheme lately sanctioned by Parliament, are surprised and indignant at hearing that, notwithstanding they have acquired vested interests through long residence, if without leases they are not to receive the smallest compensation for disturbance. The Office of Works has, in fact, assured them that their equitable claims, as they regard them, will not even be taken into consideration. Some of the tenants have occupied their premises or chambers for a long period of years, extending perhaps to half a century. To many of them it is essential to be in close proximity to the House of Commons, and other suitable offices are just now not procurable at any price. The mere fact of there arising a large and sudden demand for accommodation within a limited area is also causing a considerable enhancement of rents in the district, in itself a reason, it is felt, for moderate compensation. In any case these tenants must suffer much inconvenience and considerable monetary loss for the sake of a public advantage. An agitation, it appears, is already on foot for laying a protest before the First Commissioner of Works, and, if necessary, of making an appeal to the opinion of the public."

In a recent issue we published a letter by Mr. Thomas Wrightson on the subject of bridge-making in Egypt. A second letter on the same subject has since appeared in the Times. "Impune" writes: "Lord Cromer, in referring to the Embabeh Bridge, calls attention to the fact of the English tender being more than twice the amount of the lowest tender sent in, which he rightly thinks is too great a difference. Later on he refers to another bridge for which ten tenders were put in, and in this case the English offer was nearly three times as great as that of the

lowest. It is to be noticed that in both of these adjudications only one English offer was put in out of a large number by French, Belgian, and German houses. There is no doubt but that in these cases the English tenders were merely perfunctory, and not put in for serious competition. The reason of this is not far to seek. The terms of tender of the Egyptian Government are clogged with exacting and one-sided conditions, which put the contractor completely in the power of the Government, should he happen to be an English subject. No business man will take risks of this sort except at very much higher prices than he would ask ordinarily, if, indeed, he cares to take them at all. It is otherwise with Continental houses, who know that should the contract prove unremunerative, or in the event of difficulties occurring, they can rely upon the support of their Consular or diplomatic officials to make out a case for them, by which they would avoid the danger or are able to impose claims for extra payment themselves. Further, if matters are carried to the Mixed Courts, while the Government rarely succeeds against Continental contractors, Englishmen, on the other hand, rarely find the Mixed Courts favourable to them, and all proceedings have to be conducted either in Arabic or in French. English contractors, however, know perfectly well that they cannot expect undue assistance from English officials, and even if they tried to extract it from them, they would be promptly told (and with some justice) that they had no business to take contracts without providing for all contingencies therein. It seems strange that Lord Cromer and those English officials in Egypt, who undoubtedly wish to encourage English enterprise, do not see that some greater equality is needed than at present obtains."

"In the second place," the letter proceeds, "preparation of full plans when merely tendering is a costly and time-occupying process, and when this cost and trouble is multiplied by the number of firms who put in for a contract the amount becomes a considerable one. It surely would seem that when tendering a provisional specification and drawing should be sufficient, and if that is approved in principle and the offer accepted it would then be time enough to require the contractor to produce full designs for approval. The other alternative is for the buyer to issue complete specifications and plans for contractors to tender on. Although one or two English officials in Egypt may have strong French or other proclivities, and although the special consideration generally shown towards Continental firms in that country somewhat strikes an Englishman, yet were more consideration extended towards this country, and if specifications and contracts were framed in a manner more in accordance with English practice, there would be no difficulty in attracting competition of a very different character to that which prevails now, for I have no hesitation in saying that the existing methods are not always such as to place tenderers on an equal footing, or even on an equitable one. Conditions should not be imposed because they fall in with obsolete or inapplicable regulations, or simply because unscrupulous foreign competitors are willing to swallow them, at all events in appearance. Technical questions should not be decided on or absolutely governed by the Department of Finance. Lest there be misunderstanding on the head of more consideration being extended to this country, I hasten to explain that I mean that it would be to the benefit of Egypt itself if the competition of English makers were secured by the acceptance of methods, not only equitable in themselves and to all, but which time has proved the use and advantage of."

MR. JOHN MILLAIS is writing a life of his father, which he hopes to have ready in the autumn. He is getting some of the models who sat to Sir John to give him some of their reminiscences of the sittings. Amongst the most interesting of these is Mrs. Perugini (Kate Dickens), who is the original of the sweet-faced maiden in "The Black Brunswicker."

HOUSE SANITATION AND DRAINAGE.

By E. CROPPER.

(Continued from page 17.)

THE soil and waste-pipes having discharged their contents outside the building, it remains to describe the arrangement of the drainage system conducting the sewage to the sewer. But before doing so we will dispose of the rain-water. This may be done in three ways: 1, by drains from the feet of the rain-water pipes led into a collecting-pit or tank made watertight, and pumped up as required for use in the garden or in the wash-house; or 2, the cesspit may be made porous so that the water may soak away into the soil; or 3, it may be led to the sewer as part of the sewage from the house. In the plan of the house accompanying this article the rain-water has been collected for use. Some towns' authorities refuse to dispose of the rain-water, in which case it must be treated by methods 1 or 2, the drains being laid as for sewage with glazed stoneware socketted pipes and jointed in cement. They are then collected as shown on drainage plan, and passed through a brick filter chamber made watertight by a lining of Portland cement and sand one to one, and one inch thick, well worked into the joints and floated smooth. The water filters through a layer of clean pit sand, placed as shown by detail across the chamber, and passes to the pit. It is advisable to keep the tops of these pits under the surface of the ground, so that they do not attract the eye. A pump should be arranged where convenient to draw off the water. For a house of moderate size, a chamber 8ft. deep by 4ft. square or 5ft. diameter is a suitable size.

If the water is to soak away, there is of course no need of the filter. The pit may be about 3ft. diameter, and 4ft. or 5ft. deep, of bricks laid dry, with 12in. of broken stones as a backing to help the water away. This pit should be placed some distance away from the house, say in the centre of the tennis lawn or the kitchen garden. Both of the pits should have an overflow drain, which may be of 4in. agricultural pipes with open joints, extending about 30ft. away from the house; or, if there is a water-course conveniently near, the drain should be taken to it.

Apart from the requirements of the local authorities, rain-water ought always to be looked upon as a valuable acquisition to the garden, and it should be the rule rather than the exception to see it preserved for use. It should be treated more as a welcome visitor than an interloping vagrant to the average suburban residence.

If the rain-water is to be carried to the sewer, the foot of the down pipe may be connected to the inlet of a trapped gulley taking any of the waste-pipes from sinks, provided they can be grouped together. The rain-water then discharges under the perforated grating

of the gulley, with an open end, thus allowing the air to circulate up the rain-water pipe. One still sees them discharging by a shoe over trapped gulleys, but this is a mistake. In times of heavy storms, or if the grating becomes covered with leaves or debris, the water overflows on the gravel path or soaks into the brick walls.

When the drains from the rain-water pipe are very long, or when an old drainage system is being merely improved, or the house system only is being brought up to date, it is always advisable to put trapped gullies under the rain-water pipes; but where the whole system is quite new, and there is no sink gulley to turn into, and when the length of drain to the manhole is short, say, under 20ft., these traps may be dispensed with, the down pipe being joined direct by a stoneware bend to the drain, and so to the manhole. If the length of drain is long, then it is advisable to join the down pipe to the inlet of a Hellyer's rain-water shoe (which has no trap), which is connected to the drain. This shoe (see illustration in last issue) exposes the ends of the down pipe and the drain to the fresh air. It should not be used near windows or paths, being substituted by a trapped gulley or a direct bend into the drain in such cases.

A well-constructed system of drainage will have: (1) direct lines of drains, or nearly so, from the manholes, which will be placed so that the drains may be cleared by the long rods of obstacles that will find their way into drains; (2) good and uniform gradients; (3) careful trapping of such lengths of drains as need it, but an absence of traps where free circulation of air is better; (4) complete disconnection from the sewer; (5) ample ventilation of all drains; (6) good workmanship and materials, that will withstand the proper tests when completed. Without these any system, however well-planned, must always be a danger to health.

In arranging the drainage, place the several waste, soil, and rain-water pipes on the drainage plan, lettering each; then work in the several lines of drains to the manholes, keeping them in straight lines if possible, and the soil apart from the water drains, or carefully disconnecting them before joining.

The gradients of soil drains should never be less than one in forty, or 3in. in 10ft., and more if possible. The gradients should not dip or vary in any one length of drain, or the rods will not pass; a light should be flashed through from one end to test the drains in this respect. A gradient of one in sixty or eighty will suffice for rain-water drains if more is not obtainable.

Manholes for inspecting the drains and clearing them when choked should be at least 22in. by 18in. internally, as no man can work in less. One often sees them 18in. square, but this is not enough, unless the drain is very shallow. If the drain is 6ft. or more deep, it is better to make the manhole 27in. by 18in. or 22in., so that the rods can be used more freely. The manhole next the sewer must be at least 31½in. by 22in. to include part of the Kenon's or other disconnecting trap, and it is better 36in. long.

They are generally of 9in. brickwork, resting on a 9in. layer of lias lime concrete, which forms the floor of the chamber to receive the channel pipe, care being taken to see that the bricksetter hollows out a space in the concrete to receive the sockets of the pipes and trap, so that their whole length rests on the floor. The channel pipe being laid, the floor should be sloped up to the brick sides, as illustrated last week, the surface being finished with a ½in. coat of cement and sand, in equal proportions, trowelled hard. Galvanised wrought iron manhole treads should be built in every four courses where the depth is over 3ft., not directly under each other, but about 9in. apart. The opening at the top may be reduced by oversailing courses, to reduce the length of the stone curb. This is generally of 9in. by 4in., or 9in. by 6in. York or Purbeck stone, tooled and rebated for the iron frame and cover. Care is required in the selection of these, as many so-called "air-tight covers" are not so after the water has evaporated out of the shallow groove in which the cover rests. Moreover, a cover requires to be of much heavier and stronger pattern than usual if it is in the way of vehicles, and it is often advisable to select a locking cover where it is in the way of children's curiosity. The groove in all frames should be at least 1in. deep, and the rib of the cover fitting into it should be the same, the groove being filled with sand, or having a rubber seating in which the rib beds. The best air-tight covers, however, are those having underneath the surface cover another sunk, dished cover which can be filled with water, making a very safe seal against the emission of sewer gas.

All manholes should have a separate inlet for fresh air, so that a current may constantly be drawn in and up the drains and soil pipes by means of the extracting ventilators at the top. The inlet should be near the top of the manhole, and the 4in. stoneware pipe taken to a safe distance from pathways or windows, and either brought to the surface with a perforated grating and stone curb round raised a few inches above the ground, or taken up a convenient boundary wall, and ending in a mica flap fresh air inlet. The vertical pipe is generally 4in. cast-iron rain-water pipe.

The drains are generally laid at or near the completion of the building after the scaffolding has been removed. It is the general practice now to surround all drains with lias lime concrete; this should be an invariable rule where the drains are shallow, or run under buildings, pathways, or roads, or where shrubs abound, or where the bed of the trench is of made ground. If the drains are 3ft. or more deep, out of the way of traffic, and the bed is found to be hard, such as gravel, concrete may be dispensed with.

Drains are of glazed stoneware, or cast-iron coated with Dr. Angus Smith's solution, or treated with the Bower-Barff process for preventing corrosion. The cast-iron drains, having but one-third the number of joints of the stoneware, are used for drains passing under houses. Whatever the material be it should be of good quality. Each pipe should be tested before use, or it is unlikely that the

length of drain will stand the usual test when laid. Stoneware pipes are made as a rule in 2ft. lengths, but 3ft. lengths are now frequently used. Each pipe should be examined before use, for uneven glazing inside or outside, pinholes or blisters, any twist in length, or sockets not concentric with the pipe. Some firms also test their pipes and mark them as such.

Every pipe should rest its whole length on the bed of earth or concrete, which should be scooped out a little for the sockets and to allow the joint to be well made. If this is not looked to as the work proceeds it will not be done. The joint may be of clay or Portland cement, or with some patent bituminous substances fixed to the pipes by the makers, as in Stanford's, Doulton's, and other patent joints, which merely require wiping with an oiled cloth and laying. It is well, however, to put a cement collar round the outside of the joint to make it safer. No doubt drains so laid make the best work, but the cost is much more than with a cement joint. One great security in the patent joint is that it prevents the cement working up the socket and projecting inside the pipe, thus reducing to a minimum the possibilities of careless laying. It is very probable that this method of jointing will become the rule rather than the exception in the future, where good results are the desideratum; but the cement collar should be made outside to make it air-tight beyond a doubt.

The usual jointing material used to be clay, and it still has a few advocates, as it gives more easily with settlement than cement; but it has many drawbacks. It is not consistently hard, it cracks when drying, and the roots of shrubs and trees easily penetrate through it into the drain. The common method is to joint with Portland cement. Two or three strands of yarn or tarred gaskin should be wrapped on the end of the spigot to keep the cement back; the pipe should then be laid, and the cement pressed in the socket all round, and flounced off at an angle of 45 deg. from the outer edge of the socket. Very often the pipe is first laid and the yarn or gaskin is caulked in. To further safeguard against cement lodging inside the pipes, they should be cored as the work proceeds, by dragging through them a circular wood block of same diameter, or nearly so, as the pipe, attached to a handle. This brings any cement with it.

For drains running under a house, anti-corrosive cast-iron pipes are best; they are, of course, more costly, but fewer joints are required. They should be of $\frac{3}{4}$ in. metal or of heavy water main strength, and each pipe should be tested before being coated by sounding them with the hammer. The joints should be carefully caulked with yarn or gaskin, as before described, and filled in with molten lead caulked solid. It is better if possible to lay these in a brick subway under the basement or along the walls of the passages, but if not, they should be embedded and encased with 6in. of cement concrete. It should be noted that lime acts on iron, and in time destroys it, therefore none should be used in the concrete. Where the drain passes through a wall, it should have an arched opening, so that it is independent of any settlement.

A manhole should be placed on the drain both on entering and emerging from the building, and it is sometimes necessary, when the length of drain is 50ft. or more, to be able to examine it in the building, in which case a 6ft. length should have a sight-hole and cover, each flanged and secured with four gunmetal bolts. If the drain is encased in concrete, a brick manhole must be built round the sight-hole, but if it is in a subway, such a thing is not needed. It is often necessary to connect soil and other pipes to an internal drain, as when they pass from conveniences placed in the well of the building, and it is desirable that the junction should be exposed, greater precautions must be taken to prevent the sewer gas passing into the rooms by placing in an ordinary manhole, and on the line of junction of drains, a cast-iron inspection chamber, with air-tight locking cover and separate inlets for each pipe and drain. The Scott-Moncrieff and Smeaton's patents are examples of such con-

nections. The cast-iron drain is then continued to the front area, where the manhole receives it, and affords disconnection from the sewer.

After each length of drain has been allowed to stand a day, and before covering with concrete or earth, it should be tested by stopping up the lower end and any branches, and filling with water; a head of eight or ten feet of water should be obtained to each section to make the test more in accordance with its future use. This is not a severe test, and good materials and workmanship should stand it, showing only a slight leakage due to a little sweating of the pipes. In the best work the system is tested again at completion as a whole, but the result need not be feared if the parts have stood their first test well. If all is found correct, then the concreting may be done over the drains, but without any ramming. Earth should not be rammed until at least 12in. has been spread over the drain; water poured on it is a good substitute. It is useless for a good drain-layer to do his work very carefully, and then be followed by a heavy-handed labourer to fill in and ram.

To sum up this article, a specification is added of the external drainage usually required in a middle-class house, such as we illustrated last week, where the rain-water is separated for use.

Specification.—Lay the rain-water and other drains as shown with tested salt-glazed, stoneware, socket-jointed drain pipes, having Doulton's patent joints, and to be of the sizes shown, with all necessary bends, junctions, tapers, &c. The pipes to be bedded solid, so that the whole length rests upon the hard solid bottom.

The soil drains to have a fall of at least 3in. in 10ft., and more if possible, and the rain-water drains 1 $\frac{1}{2}$ in. in 10ft., the gradients to be perfectly uniform.

Where drains run under paths or buildings, to be surrounded with 6in. of cement concrete.

Provide and fix, where shown, Doulton's or similar reversible interceptors (Fig. 13A), with galvanised cast-iron gratings and side inlets to receive the waste-pipes under the grating. The surface gulleys to be Doulton's yard gully (Fig. 19A), or a similar pattern.

All traps, gulleys, &c., to be set in brickwork or concrete.

Build the several manholes of sizes shown, walls to be one brick thick, built in lime mortar resting on bed of lime concrete 9in. thick, and flat-jointed for lime-whiting. To have white enamelled channel pipes and bends as shown, and the sides to be sloped up in concrete and floated smooth in cement.

Tops to have two courses of brick corbelling, and 9in. by 4in. tooled York or Purbeck cover stone, rebated for Adams' or other equal air-tight galvanised cast-iron flap and frame, set in cement. Build in galvanised cast-iron horseshoe foot irons, 12in. apart, to those shafts more than 3ft. in depth. Twice lime-white walls of manholes.

Fix on sewer side of chamber next sewer, a Hellyer's or Kenon's or other equal sewer disconnector, with cleaning arm and stopper.

Arrange for making connection to sewer in road and pay all charges.

Take from near top of manhole 4in. stoneware ventilating pipe, as shown, to adjoining wall, with a bend to receive a 4in. vertical heavy rain-water pipe running up 6ft. above ground, with a 4in. mica flap air inlet fixed on top of same.

The rain-water system of drainage is to be kept separate from the soil drains, and is to be arranged as shown by plan and details, the drain being conducted to the filter-pit, which is to be built similar to manholes, with cement concrete bed trowelled hard, and walls to be rendered in cement lin. thick. To have perforated porous stoneware plates lin. thick across the manhole, built into the brickwork 3in., and the space between them filled in with clean well washed pit sand, to form the filter. Take from this a 4in. pipe to the storage tank as shown.

The tank is to be of 9in. brickwork built circular on plan 4ft. diameter and 8ft. deep, with two courses of footings, all built in cement on 18in. bed of cement concrete floated hard

and smooth, the walls to be rendered with a cement coat lin. thick similarly finished. To be covered with a 4in. tooled York or Purbeck stone in two parts, bedded in cement, and the top to be, when finished, 6in. below the surface of ground.

Provide and fix to same a hand pump, complete, p.c. £3, with a length of galvanised wrought-iron pipe extending to near bottom of tank, and taken out 2ft. from top, underground to the inside wall of wash-house where the pump is to be fixed.

Take from near top of the tank as shown an overflow drain of 4in. porous agricultural pipes, with open joints, to a distance of 30ft. (or to the kitchen garden, or neighbouring streams), to finish with an open end.

Each length of drain to be tested before covering, in the presence of the Architect or his representative, under a head of water of at least 8ft., and to show no appreciable leakage under such test.

Surveying and Sanitary Notes.

In connection with the "Hygienic Congress" at the Brussels Exhibition, the members of the Sanitary Inspectors' Association have arranged to visit Belgium early in September. Their programme includes visits to and inspection of the sanitary works at Antwerp, Malines, Ghent, Bruges, Ostend, and Brussels. Receptions by the Burgomaster, Aldermen, and Councillors will be given to them at most of those towns. M. Buis, the Burgomaster at Brussels, has invited them to a reception at the Hotel de Ville on the evening of Monday, 6th prox., and has also placed the Militia Hall at their disposal for their meetings whilst in Brussels. At Ostend a reception will be given at the Hotel de Ville on the morning of Friday, 10th prox.

The drainage of Killin (Scotland) has now been completed; the town has been laid with new sewers, and these are provided with manholes, flushing tanks, and ventilators in accord with the most recent sanitary improvements. The old system discharged into Loch Tay. The sewage is now precipitated and purified by the "International" process in works situated at the south side of the railway, in a park belonging to Lord Breadalbane. The area of the ground occupied by the works is a little over an acre. The main sewer is carried through the railway embankment in iron pipes, and thence through the screening and chemical chambers, where it receives treatment with ferrozene. Next it flows into the mixing chamber, where, by a system of paddles, it is made to travel up and down through a height of 4ft. and through a total length of 64ft. By this means it is thoroughly mixed with the chemicals, and sludge is deposited. From here it passes into the precipitation tank, which is fitted with Condy's patent sludge elevator. It is of brick, 11ft. diameter, and 14ft. deep. In this tank complete precipitation takes place, while at the surface the effluent overflows into channels, and is led into the "polarite" filters. The sludge is lifted by an ingenious arrangement. The pressure of fluid in the tank drives the sludge through perforated holes in a horizontal pipe travelling on a perch centre in the tank bottom, and balanced. When a rotary movement is given to this pipe by a rock and pinion wheel worked by hand above, the sludge rises through the pipe, and passes into the sludge pits, where it is air-dried and ready for removal as a valuable garden manure. Much satisfaction is expressed at the complete success of this installation, which is a first example of this system in the West of Scotland. The works have been designed by Mr. Wolfe-Brennan, C.E., of Oban; the contractor was Mr. Bremner, Forthingall; the iron work of the tanks, &c., was supplied by the International Water and Sewage Purification Co., London; and Mr. R. Cameron, Edinburgh, was clerk of works.

At a recent meeting of the Retford Town Council the report of the engineer, Mr. J. C. Melliss, on the drainage question, was considered. "Not many of the existing sewers are sufficiently good or at suitable levels to be made available as part of a new scheme," the report states, "but in a few instances some of them, though far from being in accordance with modern requirements, might have their reconstruction deferred until after the general scheme is carried out and completed. These are as follows: Moorgate Park, part of Lidget Lane, St. John's Street, Holly Mount, King Edward Terrace, Dominic Cross Road, part of Wharton Street, part of Caledonian Road, and a portion of West Field. The remainder of the existing sewers which are unsuitable for sewage purposes should be retained, as far as practicable, for service water drains. I have, in calculating the sizes of the sewers, provided for a certain quantity of rainfall water entering them, but all surface water and subsoil water must be excluded from the new system as far as possible. Owing to the fact that the river and several water courses pass through the town, a surface water system of drainage will not be an expensive matter, but it may be necessary from time to time to put in some additional surface water drains as they are required. The present sewage of the borough can (with the exception of the village of Ordsall) be collected by gravitation to the northern and lower end of Bollam Lane, and avoid the expense of intermediate lifts. The sewers will be of sufficient capacity for the sewage of 30,000 persons. The report goes on to state that the sewage will be conveyed by gravitation to the lower end of Bollam Lane, where a lifting station will be provided, containing three 500-gallon ejectors, two of which will be capable of lifting the sewage to the disposal works, and one will be kept in reserve. The ejectors will be worked by compressed air, and, as their action is automatic, little or no labour will be required. The land required for a site for precipitation works and filtration of effluent water, 32a, 2r, 22p. (this has already been secured). Buildings containing strainer, engine, boiler, chemical mixing, and

press houses, coal, and other stores, workshops, men's rooms, offices, &c. The machinery will be of the best, consisting of boilers, air compressors, sludge presses, mixers, &c. This machinery will be provided in duplicate, in order to guard against breakdown. The probable cost will be £38,853 19s. 5d., or, including Ordsall, about £40,000." It was explained that this would mean an addition of 1s. 9d. in the £ per annum to the rates, making altogether 4s. 3d. in the £. The report was adopted, after a lengthy discussion, and an explanation that the whole question would come before a public enquiry, to be held later on by the Local Government Board.

MR. J. E. EVERETT, the resident engineer for the construction of the new marine promenade and drive at Scarborough, reports that since his last report 208 concrete blocks have been made, containing 221 cubic yards of concrete. The foundation of the sea-wall for a length of 96ft. is complete, and a length of 54ft. has been carried up 4ft. above that level, and backed up with concrete. The excavations for foundations and the setting of blocks and backing them with concrete are now being carried on simultaneously, independently of the men who are making the blocks. The gang of men employed on the Castle Cliff are making good progress in sloping it down to a safe angle.

A NEW reservoir, constructed by the Corporation of Perth, was recently opened at Burghmuir, two miles from Perth, by Lord Provost Dewar. The reservoir is erected at an elevation of 320ft., which is an altitude sufficient to supply all the higher districts round the outskirts of the city for many years to come. The size of the reservoir is 121ft. square by 21'9ft. deep. The reservoir, when full, holds 1,956,084 gallons, being 117,300 gallons more than the existing three reservoirs hold when full. The Lord Provost, in turning on the water, remarked that it was the intention of the Water Commissioners to extend and improve the other three reservoirs, so that in dry weather there would be no difficulty in getting a proper supply for the wants of the town.

MR. EDMUND HOWL, engineer and general manager of the South Staffordshire Mines Drainage Commission, reporting on the progress of the engineering scheme for unwatering the large area of coal submerged in the Tipton district, states that the heading in the new mine coal referred to in his last report was driven in the eye pillar for 25 yards, and the pound of water outside communicated with by means of boreholes. A large quantity of water was run off during a period of two or three days, and the pressure then not being great the heading was continued through into the hollows. He examined the place, and was able to crawl a considerable distance up and into the old workings of the new mine coal. He traced the water upwards, and satisfied himself that it was travelling in the upper portion of the new mine rocks, and not in the base of the old workings themselves. Headings have now been made in this shaft connected with the pound in the bottom coal, the fireclay coal, and the new mine coal, and the principal flow is now in the rock above the new mine coal, which is the highest measure of the three. The effect on the pound has been to lower the water at Moxley, and Herberts Park, Darlaston, altogether nearly 6ft., the measurements last week showing a reduction of only 6in., and this week no reduction whatever. The heading in the new mine coal was next bricked up to prevent any sudden influx of water and the flow, amounting to over one million gallons per day, conducted in pipes to the bottom of the shaft. The level driving in the direction of Moxley old pumping engine was then resumed, and this has now reached a point 110 yards from the Bradley Lodge pit, and is being pushed forward day and night with all speed. The measures are still slightly rising, the holing being in a thin seam of coal below the ironstone balls, and six or seven feet below the bottom coal holes. Mr. E. B. Martin, reporting on the surface works, says that the increasing number of galvanising works leads to much complaint that the deposit on land of acid, or acid washings, threatens injury to clay and coal mines, and the discharge of the same into streams is a great nuisance to those below.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Aug. 20	Buckingham—Casual Wards	Guardians	T. B. Hearn, Clerk, Buckingham.

Views and Reviews.

SHIPPING MARKS ON SAWN AND PLANED WOOD.

The 1897 edition of the Timber Trades Journal list of shipping marks on deals, battens, boards, timber, joinery, and other goods exported from Sweden, Norway, Finland, Russia, Germany, and Canada, has just been issued. Each section has been most completely worked out and rendered quite up-to-date by the inclusion of the latest marks employed. The list is comprehensively arranged—the work of reference is reduced to a minimum—with the English and French classifications, compiled from information supplied by shippers, agents, and other authentic sources. The work also includes, among other features, a list of shippers, agents, and brokers engaged in the trade throughout the United Kingdom, the Continent, and the Colonies, together with a series of useful and carefully-prepared charts showing timber ports and sub-loading places. To those connected with the timber trade the revised list of shipping marks should prove of service.

"Shipping Marks on Sawn and Planed Wood," Timber Trades Journal List. William Rider and Son, Limited, London, E.C. Price 6s. and 7s. 6d.

TOURIST GUIDE TO THE CONTINENT.

To those about to undertake a tour in Holland or Germany, Belgium or Switzerland, we would recommend the eighteenth annual issue of the Great Eastern Railway Company's "Tourist Guide to the Continent," an advance copy of which lies before us. Such practical information as is necessary to the tourist is fully set out; but the great charm of this little book lies in the interesting manner in which the various routes and objects of interest thereon are described. The book possesses quite a wealth of architectural illustration, and to anyone in the Profession, whose holiday jaunts will take him into the picturesque Continent coming within the scope of the present guide-book, the work should be especially valuable. A tour in Holland, with special reference to the country's quaint old capital, is first described, and then North Germany, including Berlin, Hanover, Hildesheim, and Brunswick; South Germany, with illustrations of the famous castles and buildings on the banks of the Rhine; Belgium, with special reference to Antwerp and Brussels, and Switzerland, with all its scenic glory, are all in turn the subject of a light and lucid pen. Excellent facilities are offered by the Great Eastern Railway Company.

"Tourist Guide to the Continent," Issued by the Great Eastern Railway Company. Price 6d.

THE ART OF TRACING.

The art of tracing has all along enjoyed entire immunity from the strictures of the authoritative writer. At least we know of no work dealing exclusively, or at any length, with the subject. Numerous books written as guides to architectural draughtsmen have appeared from time to time, and now, under the title of "The Art of Tracing," we welcome a none-too-bulky work by Mr. E. W. Fritchley, Architect, of Bombay. An art, apparently so simple, yet yields ample scope for failure; much needs to be learned, and it is with the view of revealing the artistic possibilities of a limited field that Mr. Fritchley has brought out his treatise. "I am fully convinced," writes the author, "that a studious practice of architectural tracing is in itself eminently calculated to qualify one for more important spheres of duty in an Architect's office." Here is a helpful stepping-stone to the architectural assistant! Of course it by no means follows that the hand that deftly moves over the tracing-paper will give shape and form to a dream in bricks and mortar conceived by its owner, but there is no doubt that much can be learnt through the medium of tracing, and Young Hopeful, therefore, should not look upon this branch of his Art as a mere mechanical encumbrance. Mr. Fritchley's book is

divided into two parts; the first treats of materials, and the second of workmanship. After giving many useful hints on the use of tracing-cloth, Indian ink, drawing pen and ink bow, &c., the author proceeds to discuss in a simple and practical manner the question of proportion and effect, figures and letters, stencils and stencilling, colouring of plans, sections, and elevations, and in the concluding chapters imparts some useful information on the difficulties commonly experienced in tracing—the removal of ink lines and blots and repairing of damaged cloth for instance. The book, however, is but an elementary treatise on the art, and will, we hope, be followed by a second and more advanced volume.

"The Art of Tracing," By E. W. Fritchley, Architect. Education Society's Steam Press, Bombay.

GLASGOW TECHNICAL COLLEGE CALENDAR.

The wide and comprehensive range of subjects coming within the scope of the Glasgow and West of Scotland Technical College is strikingly shown in the octavo volume modestly termed "Calendar" for the session 1897-98. The College curriculum embraces mathematics, natural philosophy, chemistry, drawing, engineering, Architecture, and building construction, &c., the object of the institution being to afford a suitable education to those who wish to qualify for following an industrial profession or trade, and to train teachers for technical schools. We have previously acknowledged the success of the architectural classes under Professor Gourlay, who, with his staff of assistants, always earn honourable distinction at each examination. The courses are arranged to supplement the training acquired by the student in the office, and to prepare him for the examinations of the Royal Institute of British Architects and the Science and Art Department. The junior course deals with Classic and Mediæval Architecture, and the senior with Early Christian Mediæval and Renaissance Architecture. In addition, there is also connected with the College an architectural studio—Mr. Thomas S. Fraser, instructor—a measuring and sketching class, whilst lectures and classes are held on building construction and design, an interesting and instructive feature of the latter being a series of weekly visits to buildings in course of erection. Plumbing, sanitation, &c., also find a place in the courses of instruction.

"The Glasgow and West of Scotland Technical College Calendar for the Session 1897-98." Robert Anderson, 22, Ann Street, Glasgow.

A MONUMENT to Otto von Guericke, the inventor of the air-pump and the "Mageburg Hemispheres," is about to be erected at Odensee, near Altona. He died there in 1686, and hitherto no memorial of him has existed.

MR. J. T. MARSH, R.E., one of the inspectors of the Local Government Board, recently conducted an inquiry at the Town Hall, Newport, as to an application by the Newport Town Council to borrow £31,000 for an extension of the electrical installation.

At the monthly meeting of the Newport Borough Council, it was decided that it would be desirable to acquire some property adjacent to the Town Hall with the view to carrying out extensions. The price asked for the property is £21,000.

THE Secretary of State for Foreign Affairs has received a despatch from the Acting British Consul-General at Sofia, stating that the municipality of that town invite tenders for—(1) the supply of electric currents to light the streets as well as public and private buildings in the town and the supply of electric power; and (2) the construction and working of electric tramways in the town and suburbs. Tenders will be received for either or both of these undertakings at the offices of the municipality of Sofia up to September 22nd next, and will then be examined; but a final adjudication will be held on October 2nd if, in the interval, a reduction of 5 per cent. is offered on the tenders containing the most favourable terms. Such further particulars as have been received may be seen at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 6 p.m.

IRON AND STEEL INSTITUTE.

THE autumnal meeting of the Iron and Steel Institute opened at Cardiff a day or two ago. In welcoming the members to Cardiff, the Mayor recalled the fact that the Institute had visited many of the largest towns and cities of the United Kingdom, as well as Continental countries, and had once at least visited the great city of New York. But nowhere had they met with a more hearty welcome than that he offered them on behalf of the town, the Corporation, and himself. The reading of the papers was then proceeded with, the first being a paper by Mr. Thomas Wrightson on "The Application of Travelling Belts." "The Manufacture of Tin Plates" was the subject of the next paper, the contributor being Mr. George B. Hammond, of Penarth. In the course of his essay he said that during the last fifteen years a great revolution had taken place in the trade by the general adoption of mild steel as a substitute for iron bars, and the tin-plate trade proper might now be considered to commence with the rolling of the steel bar into black plates. Another paper submitted was one by Mr. E. D. Campbell, of Ann Arbor, Michigan, on "The Diffusion of Sulphides Through Steel," and in his absence it was taken as read. The first paper read on the second day was contributed by Professor Honore Ponthiere, of the University of Louvain, who took for his subject, "Thermal-chemical Study of the Refining of Iron." The next paper was given by Mr. Ernest Henry Laniter, of Wigan, who dealt with the subject of carbon and iron. He said so much valuable work had been done on the subject during the last few years, and so much had been added to our knowledge, that it might seem to the casual observer almost superfluous to endeavour to throw new light on the problems connected with the relation of carbon to iron. However, those who had followed the subject freely admitted that very much remained to be learnt, and it had occurred to him that there were several directions, old and new, by the investigation of which additional information might be gained on this important subject. The directions which suggested themselves were: (1) the thermal treatment of iron and carbon; (2) the saturation point of iron with carbon by fusion in contact with excess of carbon; (3) the saturation point of iron with carbon by heating without fusion in contact with excess of carbon; (4) the etching of pure carbon-iron alloys at red heat, in order to ascertain their structure by means of the microscope at that temperature.—After other papers had been read, the president proposed votes of thanks on behalf of the Institute to the Mayor of Cardiff, the Institute of Engineers Local Reception Committee, the proprietors and managers of the various docks and works thrown open to the inspection of members, and the votes were heartily accorded. On the concluding day the members were taken by steamer from Newport to inspect the docks there and afterwards landed at Barry, where they were entertained by the Barry Railway and Dock Company. They were shown over the Alexandra and other docks, the whole of which are the property of Lord Tredegar and Sir George Elliot.

THE Sheffield Corporation (says a Sheffield correspondent) is about to introduce the electrical overhead system on all the present tramway routes within the city, and also to make extensions to many of the popular suburbs.

THE session of the Crystal Palace Company's School of Practical Engineering was brought to a close recently, when Mr. G. A. Goodwin (past president of the Society of Engineers) distributed the certificates gained by the students. Mr. Goodwin said he had been much impressed with the large amount of work which yet remained to be done by the skill of engineers. It was an indisputable fact that English engineers were the pioneers in the profession, and he believed they would ever continue to hold their own in design and originality, and in substantial workmanship.

TECHNICAL EXAMINATION RESULTS.

THE CARPENTERS' COMPANY.

SUBJOINED will be found the complete list of the winners of the medals, &c., presented by the Carpenters' Company to students attending the day and evening classes conducted under the auspices of the Company in conjunction with the Council of King's College. All prizes of money are given in books to the value of the prize won:—

Architecture and Building Construction.—Day classes, first year: C. W. Myddelton, silver medal and £2; A. E. Ruffhead, bronze medal and £1; C. S. Sparrow and P. B. Le D. Tree, certificates of distinction; F. E. L. Hurst, S. L. Walkden, and E. H. B. Clark, certificates of approval. Second year: A. J. West, silver medal and £2; W. Shelley, bronze medal and £1; C. F. R. N. Weston, W. Marchmont, H. W. Minnitt, and N. B. Rosher, certificates of distinction; H. J. Mellis and T. R. Renfree, certificates of approval. Third year: H. C. Bishop, gold medal and £3; E. F. Knight, silver medal and £2; G. A. Turner, bronze medal and £1.

Quantities, Specifications, and Estimates.—A. F. Vigor, certificate of approval.

EVENING CLASSES.

Architectural History.—F. G. Pain, silver medal and £3; C. W. Beaumont, bronze medal and £2; W. G. Trew, certificate of distinction and £1. **Building Construction:** S. A. Switzer, silver medal and £3; C. J. T. Dadd, bronze medal and £2; J. Gough, certificate of distinction and £1; T. Graves, A. Keene, and C. Phillips, certificates of distinction; A. Harrington, W. Drake, and F. G. M. Chancellor, certificates of approval. Medal given annually by the present Lord Mayor for sanitary building construction: A. Carter. **Quantity classes:** J. Kent, certificate of distinction and £3; S. A. Switzer, certificate of distinction and £2; T. Graves, certificate of distinction and £1; B. A. Keene, certificate of distinction. **Constructional drawing:** J. Gough, certificate of distinction and £3; W. Drake, certificate of distinction and £2; C. J. Dadd, certificate of distinction and £1; C. French and C. Phillips, certificates of distinction; A. Harrington, F. J. Bishop, T. Pilgrim, and F. Barnes, certificates of approval. **Architectural studio, evening:** J. G. Wiles, gold medal; P. C. Blow, silver medal; H. C. Bishop, H. Gloyne, and W. Marchmont, bronze medals and £1; M. Zimmerman, certificate of distinction. **Wood-carving.**—Mr. Howard's class: Miss T. Carpenter and T. Ainsworth, silver medals and one year's scholarships; L. A. Waldron, bronze medal and two terms' scholarships. Kensington, Miss E. Leadbitter, highly commended. Mr. Bull's class: John Dunn, silver medal and two years' scholarship; A. J. South, bronze medal and one year's scholarship; A. C. Martin, highly commended. —The conversation, at which the prizes will be distributed, has been fixed for Thursday, 30th prox., at King's College, when Dr. Robertson will be supported by Mr. J. H. Gibbins, Master of the Carpenters' Company, and others. There is to be an exhibition of some of the work executed, and a very instructive gathering is anticipated. It should be added that the Carpenters' Company offer a scholarship, which is entirely open, to be competed for at the examination held at the end of September.

A DAMAGED PIER.

EXTENSIVE SCHEME OF RE-CONSTRUCTION.

THE damage to the North Pier, Tynemouth, and the best mode of dealing with it have been referred by the Tyne Commissioners to experts of the very highest standing in the engineering profession—viz., Sir J. Wolfe Barry, and Messrs. Coode, Son, and Matthews, of London. The joint report gives a full and complete history of the pier work from its inception to the present time, and also pays a very high tribute to the personal worth of the late Mr. Messent, the engineer to the Tyne Commissioners, who was associated with the execution of these great works from their commencement, extending over a period of forty years. In the beginning of last April the above-named experts made a careful examination of the North Pier, from which it became evident that before a definite opinion could be expressed as to the proper mode of procedure to be adopted for making good the damage, and placing the pier in a secure and satisfactory condition, further important particulars were required, not only as to the depth of the rubble mound on which the masonry blocks had been founded, but also as to the nature, thickness, and

CHARACTER OF THE STRATA

lying between the base of the mound and the surface of the hard shale which it was believed existed beneath the pier. In order to procure the last-named information it was found necessary to make a series of borings through the masonry, the rubble base, and the underlying strata—a work of great difficulty, and occupying considerable time. Although from the first the urgency of this matter was fully felt, it was considered that, in the absence of the information which would be secured by these borings, the report would not be of such a character as the importance of the case demanded. The North and South Piers of the Tyne were designed by the late Mr. Walker; the plans of the first portion of the North Pier were prepared in 1855, and the work was commenced in the following year. The first contract provided for a length of 1400ft., and the plans of the second portion for a length of 1300ft. These were prepared mainly by Mr. Walker, though not completed at the time of his death. The total length of the pier, as constructed, is 2907ft. The outer portion, including the head and lighthouse, were erected from plans prepared by the late Mr. Messent.

THE GENERAL DESIGN OF THE PIER

comprehends a base (or mound) of rubble stone, carrying a superstructure of masonry. The latter consists of longitudinal sea and harbour walls, connected by cross-walls, the enclosed spaces (or pockets) being filled with rubble hearing for the first length of 1400ft., and with cement concrete, either blocks or mass work, for the remaining length. The pier is 37ft. wide at coping level, and 50ft. wide at low-water mark. The width of the quay at coping level is 18½ft., and on the seaward side of this quay there is a raised promenade 13ft. in width, with a parapet of 3ft. 6in. thick for a length of 2575ft., and 5ft. thick beyond that point. The quay level of the pier is 10ft. above high-water of ordinary spring tides, and the top of the parapet is 24ft. above high-water. The tide at the entrance to the Tyne rises 15ft. The sea and harbour walls consist of blocks of cement concrete or of rubble built with cement mortar, faced with limestone ashlar, the promenade wall being faced with coursed rubble freestone. The harbour face of the last-named work contains arches or alcoves, each 15ft. in width, placed 35ft. apart. Above low-water all the blocks were set and grouted in cement. Below that level the blocks were laid without cement. The foundations of the second length, under the plans of 1863, were to have been laid at levels varying from 3ft. 4in. to 12ft. below low water. As the works advanced, however, it was found desirable to carry the foundations to a lower level. Consequently, along the sea-

ward face the blocks were laid at increased depths. The foundation courses on the seaward side are protected by foreshore blocks of concrete weighing thirty-six tons each, resting on beds which are approximately level, excavated in the rubble base. At 2200ft. from the west end these blocks were laid 12ft. below low water at ordinary spring tides, this depth being gradually increased, as the work advanced eastwards, to 23ft. at the outer end of the head. Except for some damage which was caused to the pier by the gale of December, 1867, commencing at 1500ft. from the west end, the structure appears to have withstood the heavy storms by which the N.E. coast is visited in a fairly satisfactory manner up to the end of the year 1893. The first note of anxiety was sounded at the end of that year, when the mammoth crane was washed off the pier. But no damage which could at that time be detected had been caused to the permanent work. In the spring of 1893 and 1894 it was found that fifty lineal yards of the foreshore blocks had been displaced, and some partial movement had taken place in a further length of seventy-three yards eastwards. So far as it then could be ascertained the structure had not otherwise suffered. In July, 1894, Mr. Messent reported to the Tyne Commission that a length of 130ft. of the foundations of the sea-wall had been exposed, and in some cases undermined, but without causing settlement or injury to the permanent work. The hollow spaces were filled with concrete in bags, and large quantities of scrap chain were placed outside as a protection until the foreshore blocks could be replaced. In the spring of 1896 it was ascertained that the winter storms had further

DISTURBED THE FORESHORE BLOCKS

and had undermined a portion of the foundations of the sea wall, drawing out a considerable number of the face-blocks below low water. In January, 1897, severe storms caused still further damage to the pier, a length of 110ft. of the seaward face falling, and the hearing being partially removed up to the back of the harbour wall. Early in February this year further gales occurred. These carried away the standing portion of the last-named wall for a length of 17ft., causing a clear gap in the structure to that extent. Subsequently this breach was widened by the action of the sea. One of the most important matters which came on for early consideration was the possibility of adopting immediate measures to prevent further damage to the structure by the gales of next winter. At a consultation with the Commission early in April the experts gave it as their opinion that it was entirely impracticable to effect such repairs, and they said that, had measures been adopted in the early spring with a view to the underpinning and strengthening of the existing work, they did not hesitate to state emphatically that such repairs would have resulted in disaster, and could not have secured the work from further damage during the coming winter. As the matter now stands, there is every reason to anticipate that the undermined work will fall on the occurrence of the next heavy gale, and that there is no possibility of averting an extension of the breach during the approaching winter.

THE FAILURE OF THE PIER WORK

is unquestionably due to one cause only—viz., to the insufficient depth below low water at which the foundation blocks were laid on the rubble base. The portion of the structure which has been breached and undermined was founded at the level of 21ft. to 24ft. below low water. The design prepared in 1862 contemplated a depth for the foundations of 12ft. below low water. Therefore the changes which have been made in carrying out the work, in the lowering of the foundations and the protection of the footings by foreshore blocks, and in the substitution of cement concrete for lias lime for the hearing have been in the right direction, although, as experience has now shown, these precautions were not carried sufficiently far with regard to the depth at which the foundation blocks had been laid. Experience has shown in recent years that the

A NEW Conservative Club, situate in Victoria Street, Crewe, was recently opened.

THE foundation stone of a new Congregational Church in Farrar Street, Barnsley, was laid on Thursday week.

A NEW organ, presented by Mr. John Feeney, of the Moat House, Berkswell, for the Berkswell Parish Church, was recently dedicated by the Bishop of Worcester.

A NEW technical school for Handsworth is to be opened on September 29th. The tender of Messrs. Fisher and Co., amounting to £370, for the supply of furniture and fittings for the school has been accepted.

disturbing action of the sea on rubble bases supporting structures in positions of great exposure such as that of the Tynemouth Pier, takes effect to a much greater depth than had been formerly supposed. The borings taken under the directions of the above engineers at a distance of from 2400ft. to 2840ft. from the west point show that shale is met with at from 38ft. to 43ft. below low water. From that point outwards good boulder clay is to be found under the head of the pier at about 44ft. below low water. The engineers report that they would not consider it prudent to recommend that the

FOUNDATIONS OF THE WORKS

should be placed at a higher level than 35ft. below low water, having regard to the exposure of the site and to adequate provision being made for the recoil of the sea from the face of the pier during gales. Such a level for the foundations would only be from 4ft. to 5ft. above the surface of the shale, and as it would be impracticable to found the work on the stratum of sand and mud overlying the shale, they have come to the conclusion that, in order to secure permanence for the length which has been damaged, including also the standing portion eastward of this and a short length landwards of the breach, the existing work should be removed and replaced by a new structure. The foundations of the head of the work have been laid at 27ft. below low water. The engineers do not consider such a level to be sufficient to ensure absolute immunity from damage during gales of extreme severity. Therefore, although no injury to the permanent structure of the pier-head itself has yet been sustained, and nothing more serious has happened to it than the displacement of some of the foreshore blocks, they are of opinion that it is necessary to carry the work down to the shale in order to make good the portions breached and undermined. It is estimated that the cost of removing the existing structure and *débris* from the fallen work, including excavation through the rubble base and the strata of sand and gravel, and of sand and mud underlying the same, founding the work anew on the shale bed and boulder clay, reconstructing the pier for the length of 750ft. with parapet, and re-building the pier-head and lighthouse, will be over £800,000. We understand that there is a very strong feeling in the minds of many members of the Commission that, whatever is done with respect to the above works, it shall be done by contract. The engineers themselves recommended this course in their interview with the Commissioners.

Up to the present time £1300 has been received towards the cost of the new wing for Lowestoft Hospital.

SIR MATTHEW WHITE RIDLEY, M.P., opened last week the two new wards which have been added to the Blackpool Hospital.

The memorial stone of a new Baptist Sunday School has been laid at Earlestown. The school, when completed, will cost about £560.

It is proposed by the Derbyshire County Council to build a new police station and lock-ups at Castleton. The site is at the entrance to the village from Sheffield.

At Douglas the new Church of St. Matthew's was recently opened. It was stated that £1500 was still required to completely finish the work of construction, and to make the Church, as was intended, perfectly free and open. Altogether the Church will cost £5000.

CHESTER CATHEDRAL was broken into one night recently and the contents of three offertory boxes stolen. Irreparable damage was also done to a handsome memorial stained glass window, erected in the north aisle to the Rev. Joseph Eaton, formerly Precentor of Chester.

It is stated that Mr. Tate intends to add very shortly to the capacity of the New British Gallery, as the rooms are already practically filled; and now that the Chantry Trustees have at their disposition such a splendid receptacle for their purchases they are sure to be inclined to spend their funds to their utmost extent.

Professional Items.

ABERDEEN.—Satisfactory progress is being made with the erection of the new Corporation lodging-house in East North Street, and in a couple of months the masons will have finished their part of the work. The whole of the front elevation of the building is completed, and is now the most prominent feature of the street, the bright new granite forming a striking contrast to the dingy aspect of the other houses. There is a frontage to the street of nearly 100ft., and the building rears itself to a height of almost 60ft. The principal doorway is surmounted by massive cornices, smoothly dressed. Overhead, on the crow-stepped apex situated above the doorway, are the city arms cut in granite, but this is the only attempt at ornament on the face of the building. Within, operations are not sufficiently advanced to give any idea of the ultimate appearance of the interior, but one thing already evident is that the various apartments will be spacious and well lighted. The whole building is to be of fireproof construction, and the iron joists on which the cement floors are to rest have now been placed in position. Not a trace of woodwork is to be seen in the frame of the house, the very lintels of the windows being of metal. The main portion of the lodging-house is ready for roofing, but some time will elapse before the remaining portions are covered.

ABERYSTWTH.—A new hotel, the Cambria, was opened a few days ago. It occupies a commanding position at the western end of the promenade, opposite the pier, and has been erected from the designs of Messrs. Ewen and J. Alfred Harper, Architects, of Birmingham, who have had to overcome many difficulties as regards the site. The hotel is built of native stone, in the Renaissance style of Architecture. The front elevation is relieved by an effective treatment of the entrance and windows, with massive freestone dressings, carved entablature, and finely-moulded cornices.

ARBROATH.—The new engine-sheds which have for some time past been in course of erection at Arbroath for the Joint Railway Company have now been completed and opened. The site of the new buildings is on the west side of the Arbroath and Forfar Railway in Dens Road. In order to secure sufficient space for the new sheds, a deep cutting, measuring at the south end about 26ft., had to be made in the side of the high-lying field opposite, which forms part of Cairnie Farm. This cutting has had to be flanked by a massive retaining wall, a portion of which is 9ft. 6in. in thickness. The wall has been built up to the level of the embankment, and at the end of Ogilvy Place it has been surmounted by another wall 6ft. high in order to shut off the ground and secure the safety of the public. The new engine-shed is about 190ft. long and 60ft. broad, the walls being 20ft. in height. The walls are built of red and white pressed bricks, with a base of Carnyllie freestone. Six bays of roofs run transversely from end to end of the building, and between each of twelve windows, which have semi-circular tops, there are inserted in the building on both sides plasters of red and white bricks, the latter adding considerably to the appearance of the building. Ventilators have been provided in the gables between the bays in the roofs, and smoke escapes are supplied at the apex of each roof. The roof is supported on five girders, each weighing four tons, placed at intervals across the building from wall to wall. In all about 20,000 cubic yards of ground have been excavated in connection with the works, and the new sheds, &c., have been put up at a cost of about £10,000. The contractors were Messrs. Howe and Son, Dundee, the sub-contractors being: Mason, Mr. Sheach, Dundee; plumber, Mr. D. Brown, Dundee; glaziers, Mr. Robert Farquharson, Arbroath, and Mr. Pennycook, Glasgow. The plans and specifications were prepared in the office of Mr. Barr, C.E., Caledonian Railway, Perth, and the whole of the extensive works have been

carried out in a satisfactory manner under his supervision.

ASTON.—At a recent meeting of the Aston Board of Guardians a long discussion took place upon the question of the cost of the proposed cottage homes. The Building Committee reported that it had received the detailed estimate for the homes, and had had under consideration a letter from the Local Government Board upon the subject. The total cost would be £50,000, and it was recommended that the estimates should be accepted, and that the Local Government Board should be asked to sanction a loan of £39,540, repayable in sixty years, to defray the cost of the building of the structure and the Architect's charges; and a further loan of £10,460, repayable in twenty years, to meet the other charges. It was stated that since the original estimate was made for the carrying out of the work for about £25,000 or £30,000, many alterations had been made in the scheme, in accordance with the wishes of the Local Government Board. The prices of labour and of building material had also greatly increased, the cost of furnishing the buildings had not been included in the first estimates, and sixteen homes were now to be built instead of twelve. Eventually the report was adopted by fourteen votes to six.

BLACKPOOL.—The Borough Surveyor has submitted to the members of the Council his scheme for widening the Promenade—an improvement that has now been talked of for some years. He shows that the present Promenade varies in width from 24ft. to 70ft., and the footpath from 5ft. to 17ft. The scheme, which will probably be put before Parliament for sanction, provides for a footpath 10ft. wide on the east side next the houses, a carriage way 55ft., an island footpath 10ft. wide, a raised track for a double line of trams the whole length of the Promenade 20ft. 9in. wide, and then the Promenade footpath, with a uniform width of 42ft., faced at the side by a sloping hulking of 15in. granite setts. The sea wall will be exactly like that on the North Shore works, and will run on the same level till it meets the new Promenade opposite the south end of the Tower, where it will join the upper one. The concrete of which it will be constructed will be 7ft. thick, and faced above the granite hulking with concrete blocks and coping. The estimates state that the cost of the section from the south end to the Manchester Hotel will be £117,896; the second section, from the Manchester Hotel to the Royal Hotel, £98,661; and the third section, as far as the North Shore Promenade, £132,424, a total cost of a little under £350,000. The scheme has already been considered by the Council, and awaits final decision.

BLYTH.—At the South Blyth Council, plans were submitted for the erection of new Bank buildings in Bridge Street, Blyth, for Messrs. Hodgson, Barnett, Pease, Spence, and Co. It was decided to let the consideration of the plan lie over, pending a block plan being submitted; and it was further resolved to request Sir M. W. Ridley's agent to furnish an "elevation" of the new building scheme for Bridge Street, in order to secure uniformity.

BUXTON.—The Lord Bishop of the Diocese recently dedicated the new chancel of St. John's Church, Buxton. The structure has been in course of erection for many months past, under the superintendence of Sir Arthur Blomfield and Sons, from whose designs the work has been carried out. The contractors were Messrs. Cornish and Gaymer, of North Walsham. In order to provide a chancel, the east wall of the Church was removed, and rebuilt between the massive columns of the east portico, the space thus gained being divided so as to give a wide open space for choir and clergy, surrounded by a low wall supported by a flight of three steps. To the centre is the sanctuary, and on the north side the clergy vestry, while on the south side is a porch for bath chairs. The new altar, in carved oak with the five crosses, is seven steps above the nave floor level. The reredos has been recon-

structed in classical style, and on the massive black marble super-altar rest the ornaments. The credence is in the south wall. The East window is by Mr. C. E. Kempe, of London. The centre light contains a representation of the Crucifixion, with St. Mary and St. John on either side. The choir and clergy stalls are carved in oak, and on each side of the arches rests the electric four-manual organ, built by Messrs. Hill and Sons, of London, from the design of Mr. Robinson. Only a portion is now complete. The mosaics of the sanctuary and chancel are the gift of a visitor.

CARLISLE.—Last week Messrs. Castiglione and Gibbings, Carlisle, offered for sale, in the County Hall, Carlisle, the historic mansion of Dalston Hall, about three miles to the west of Carlisle, together with the estates connected with it, comprising land and properties producing an annual rental of £1604. The mansion was built in the fifteenth century, upon the site of the old fortified house which belonged to the Dalstons, a family which "came over with the Conqueror." Portions of the old building still remain, including a "pele tower." The hall is interesting, in a historical sense, chiefly as having been the headquarters for a time of Leslie during the siege of Carlisle by the Scots, after the battle of Marston Moor. The property, as a whole, was run up to £35,000, the last bidder being Mr. E. W. Stead, Haraby, near Carlisle. A number of outlying portions of the estate were then disposed of, and the mansion, with the remainder of the estate, was afterwards knocked down to Mr. Stead at £35,000.

CHAPEL-EN-LE-FRITH.—Messrs. Alfred Hill and Brother, contractors, Tideswell and Litton, have commenced the further restoration of the Church at St. Thomas à Becket, Chapel-en-le-Frith, in accordance with the terms of a faculty granted by the Chancellor of the Diocese. The removal of the old gallery at the west end of the Church opens up an ancient archway of the Georgian period, leading into the tower. The improvements, which are extensive, are done at the cost of Mr. S. Needham, a parishioner.

CHESTER-LE-STREET.—After many years of agitation in favour of a bridge over the Wear between Chester-le-Street and Lumley, it may now safely be said that the bridge will be built in the near future. Lord Scarborough has decided to replace the present antiquated ferry by a light footbridge. The only question now at issue is the site.

CUMBERLAND.—Mr. George Drake, of Bradford, has just successfully carried out the operation of letting fall a large chimney formerly used by the Parton Ironworks Company, Cumberland. The chimney was 200ft. high and 60ft. in circumference at the base, and was one of the highest on the West Coast. The great feature of the operation was that neither timber props and fire, as is usually the case, nor dynamite was used. The base of the chimney was completely cut away for half its diameter, and then the shaft was gradually wedged over. Mr. Drake himself directed operations, and gave the necessary warnings. Seven or eight minutes after the word was given for the men to come away the tall column of bricks and mortar fell with a terrific crash, and in almost the desired direction. The whole operation took about eighteen hours.

DUNFERMLINE.—The tower formerly connecting the Abbey of Dunfermline with the Palace, which has been converted into a Museum, was opened by Mr. Andrew Carnegie a day or two ago. The tower, which is a massive oblong building situated at the south-west corner of the Abbey grounds, was until recently used as a sexton's toolhouse, but has been transformed into a home for antiquities connected with Dunfermline and neighbourhood. The work of renovating the building has been carried out under the direction of Her Majesty's Office of Works, the plans being prepared by Mr. Hawks. The alterations, which it was necessary to make have been of such a character as to retain the whole

building in harmony with its surroundings. There are in all four rooms of different sizes and shapes. The windows have been filled in with Cathedral glass, and in the principal apartment the Scottish standard and the Dunfermline burgh arms appear in the eastern and western lights respectively, while Mr. Carnegie's monogram is shown in another.

GLASGOW.—At a recent meeting of the Free Church Presbytery of Glasgow, plans were submitted by Mr. James M'Michael, junior, for the erection of a new Church in Springbank district. Mr. M'Michael said that the cost of the Church, including the site, which had been secured at the junction of Garscube Road with Gairbraid Street, was estimated at about £9000. With the grant they were getting from the Presbytery they had the prospect of opening the Church free of debt. The plans were remitted to the Church Planting Committee for consideration and report.

GLOUCESTER.—The Gloucester Board of Guardians has appointed Mr. A. Saxon Snell, of London, and Mr. Walter B. Wood, of Gloucester, as joint Architects to the proposed new workhouse, infirmary, and cottage homes.

HALIFAX.—The project at Halifax for erecting a new court-house, police station, cells, &c., on the site of the old Infirmary, in Harrison Road, has now been under discussion for at least twelve months. The site has been bought and paid for, and two competitions for plans have also taken place—and been paid for—and yet a decision on the points at issue seems as far off as ever. The fact is, the Watch Committee, with whom the decision practically rests, is hopelessly and evenly divided as to whether the old building shall be "adapted" or an entirely new structure erected.

HUNMANBY.—A bazaar was recently held in aid of the restoration of the Church of All Saints, Thwing, near Hunmanby. The Church dates back to the twelfth century, and contains Norman work. It is proposed to preserve all its ancient features, but the pews will be placed by open seats. The fine old font, which had been removed from the Church, and was lying in a garden in another parish, has been repaired and restored.

LANCASTER.—An Exhibition of Arts and Crafts was held last week in the Drill Hall. In previous years there have been held in the town exhibitions partaking in some degree of the character of this, but not on so large and comprehensive a scale. The Countess of Bective was approached with a view of enlisting her interest in the present Exhibition, which was intended to be in the nature of a Diamond Jubilee celebration, and the efforts of her ladyship and a representative committee were entirely successful. The exhibits included paintings, drawings in monochrome and water colours, wood-carving, modelling, metal work, carpentering, stone work, painter's work, plumbing, &c. The works of Fine Art were many of them extremely creditable, but to many the quality and varied character of the productions in the handicrafts and minor arts were even more interesting. The Exhibition proper was supplemented by a loan collection from South Kensington. Probably the most notable of other exhibits are some pictures sent by Mr. Ruskin, including several of his own drawings and a few water-colours by Turner, these embracing "The Aiguillette" and Winchelsea.

LONDON, E.—An additional factory has just been completed in the Minories for Messrs. James Taddy and Company, the old-established firm of tobacco manufacturers. The new premises have been erected for a special branch of their manufacture. The Architect is Mr. Edwin J. Sadgrove, of Surrey Street, Strand, and the builder Mr. T. E. Mitchell, of Hampstead Road. The building is a substantial and imposing structure. The principal material used in the elevation is Portland stone, and red and glazed bricks have been liberally used in the interior. The sanitary

work has been executed by Mr. G. Jennings, of Lambeth, and special systems of ventilation and water filtration have been installed to meet the special requirements of the factory.

NORTHWICH.—With the exception of the displacement of a few more bricks in the archway beneath the sanctuary, there has been no further perceptible subsidence at the Dane-bridge Parish Church, Northwich. The building, however, is in a most dilapidated state, and the walls are held together by iron bolts. Five years ago an Architect reported it to be dangerous, and it is now felt that entire demolition is the only safe procedure. An examination of the entire structure has been made, and the rural dean has paid a visit of inspection with the object of reporting to the Bishop of Chester. The Church is situated in an area greatly affected by subsidence. Within a short distance there are two houses badly cracked; at various times portions of the roadway in the vicinity have sunk, and seven or eight years ago the old Wesleyan Chapel was found to have suffered so much from subsidence resulting from brine pumping that it was razed to the ground. It is probable that the Church will be pulled down and replaced by a structure on the composite principle.

PERSIE, N.B.—A stained glass window, and also a neat porch, has been erected in Persie Church. The window is circular, filled with Cathedral tinted glass, having a white panel in the centre, with a dove on same. The porch is a much needed improvement. The window is by Messrs. Lindsay and Scott, Dundee, and the other tradesmen are—Mason, Mr. James Paterson, Persie; joiner, Mr. James Keay, Clayquhat; plasterer, Mr. W. Mitchell, Alyth; slater, Mr. R. Craigie, Blairgowrie; plumber, Mr. G. P. Kidd, Blairgowrie. The plans were drawn up and the work superintended by Messrs. L. and J. Falconer, Blairgowrie.

PORTSMOUTH.—Mainly at the instance of the Mayor (Mr. G. E. Couzens) it was resolved at Portsmouth that the permanent memorial of the Queen's reign should be the commencement of a new hospital. The existing building, the foundation-stone of which was laid by the late Prince Consort on September 27th, 1847, is regarded as unsuited for modern requirements; and as the beginning of a better and more up-to-date edifice, two blocks are to be erected. For the work, over £15,000 has, since January last, been raised in the town and neighbourhood. The Duke of Connaught was invited to lay the foundation-stone of Block A, and His Royal Highness readily consented. The ceremony accordingly took place on Saturday week.

PYECOMBE.—It would be a thousand pities if the fine old Church of Pyecombe were left much longer in its present condition. The structure itself is seriously in need of repair. The Church is of great antiquity, and is very interesting from an archaeological point of view, as, in addition to the Norman work, there are some traces of Saxon material to be found in it. A remarkable feature is the triple arch (of more than one architectural style) dividing the nave from the chancel; and the leaden font, which is believed to date from the eleventh century, is also of much interest. Very few leaden fonts are to be found in the kingdom—about twenty, it is believed, three of which are in Sussex Churches. The Church is in a very exposed position, situated as it is on a hill, and no doubt the serious state of the fabric owes much to the weather. Among the works which it is necessary to take in hand are the re-roofing of a portion of the tower and nave, restoring the belfry, putting in new windows, with fresh iron, lead, glass, and stonework, painting a portion of the walls with petrifying damp-proof solution, improving the heating apparatus, improving the seating, altering and increasing the accommodation for the school children, putting new guttering and stock pipes to the roof, and a new brick drain round the exterior of the building, &c. It is estimated that a sum of £500 will be required.

ST. PANCRA'S, N.W.—The new buildings which are being erected in Tavistock Place, St. Pancras, for the new Passmore Edwards Settlement, will not be entirely ready for occupation till the beginning of the new year. The new buildings, toward the erection of which Mr. Passmore Edwards has contributed the sum of £12,000, will contain a concert and lecture hall, classrooms, library, gymnasium, and a large drawing room and dining room, together with rooms for a warden and eighteen or twenty residents.

SCARBOROUGH.—The Local Government Board has written to the Town Clerk of Scarborough (Mr. J. E. T. Graham) stating that it is prepared to sanction the borrowing of the sum of £16,100 for the purchase of property comprised in the Harcourt Place improvement, which is to give better means of intercommunication between Huntress Row and St. Nicholas Cliff, for a term of 50 years, but that if the Town Council determined to re-sell the surplus land, the Board would only allow a term of two years for the repayment of the loan for the land.

SHEFFIELD.—The premises which, Mr. John Walsh is erecting in High Street occupy a site of over three-quarters of an acre, and have frontages to High Street and Mulberry Street of 172ft. and 200ft. respectively, and the latter will be considerably improved by the addition of a covered footpath 6ft. in width. When completed the total area of the floors will be about 3½ acres. The ground floor of the building will be 150ft. wide by 200ft. long, and a feature will be the absence of all internal walls. This floor will be divided, however, into six salesshops, each 25ft. wide by 200ft. long, by columns, which will be so placed as to cause no obstruction to either passengers or counters. Over the back part of the showroom two floors of workshops will be built. The upper part of the building will be set back 3ft., so that for the 372ft. of frontage there will be no greater obstruction to the show of goods than 1½ in. wooden window bars. The style will be French Renaissance, and the upper part of the building will be of Huddersfield stone. Messrs. Flockton, Gibbs, and Flockton are the Architects, and Messrs. Longden and Son the general contractors.

WILLESDEN.—The Willesden Board of Guardians has appointed Mr. A. Saxon Snell, F.R.I.B.A., as Architect to the proposed new workhouse, infirmary, and cottage homes.

The nave of the new Swansea Parish Church was opened on Thursday.

The Town Council of Aberdeen is to be recommended by a special committee to erect a Corporation slaughter-house, at an estimated cost of £30,000.

The authorities of Gefle have decided to build a new harbour and to deepen and improve the access through the fiord. The total cost is estimated at about £55,000.

There is a project on foot to erect an hotel at S. Salvatore on Mount Vesuvius, which will be the first mountain hotel near Naples to which the inhabitants can resort during the heat of summer.

The London County Council has completed the purchase of Fortune Green, West Hampstead, which is to be used as a recreation ground, for £8000. The Green comprises about three acres, to be maintained as an open space by the Hampstead Vestry, which has agreed to contribute £3000 towards the expense, a similar sum having been given by the London County Council, and the remainder raised by subscription.

The sale of Captain Brinkley's interesting porcelain collection at Christie's brought a total of £900 for the 208 lots. From another source came a beautiful Japanese six-leaf screen, painted with monkeys, fir trees, &c., which Lord Mayo secured for 20 guineas; and a set of four Louis XV. fauteuils, carved and partly gilt, the backs, seats, and arms stuffed and covered with old Aubusson tapestry, with groups and wreaths of flowers on yellow ground, which brought 62 guineas.

Enquiry Department.

EMBOSSING GLASS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I understand it is impossible to emboss glass unless the whole surface is done, and that, in the case of bevelled edge embossed glass panels it is usual to emboss the entire surface of one side, and afterwards bevel both sides, which removes so much of the embossing as is affected by the bevel. I have had some glass panels prepared and ordered the same to be embossed and bevelled, and the result was that these panels came to hand embossed and bevelled the same side. Why can't the embossing be done on opposite side to bevelling and stopped immediately behind edge of bevel so as not to cause the other side of glass to be bevelled and also not to spoil the effect of the bevelled edge.—Yours faithfully,

H. G. B.

The art of manufacture has been brought to such perfection at the present time that it is extremely difficult to find anything really impossible, using that word in its proper sense, and we find our correspondent does not require anything impossible in desiring to have glass embossed upon one side and bevelled upon the other.

We briefly describe below the methods employed in embossing and bevelling glass. Although some firms do both they are two quite separate and distinct processes, and there are many firms who limit themselves to one or other of them.

GLASS EMBOSSING.

Although this is with rare exceptions the second process, we propose describing it first, as the sort of glass sent to be bevelled is affected according to whether it is going to be embossed on both sides, or only on one, or to be bevelled only.

After plate glass has been cast it has to be ground perfectly flat before the final polish can be produced. If the glass is purchased in this state the labour and expense of polishing it is saved, and it is, therefore, in this condition that it is stocked by the tradesman for embossing purposes. If it is intended to emboss it on both sides, then both sides of it are ground or obscured, and if on one side only, it is obscured only on one side.

The obscuring or grinding of the surface is not part of the process of embossing, the glass having never been brought up to a polished surface at any period of its entire manufacture. This accounts for the whole surface, with the exception of the design, being ground; and if the finger is passed over this surface, the pattern embossed upon it will be found to be slightly depressed. To produce this the glass is coated with a thin sheet of wax, through which the embosser etches his design, which, of course, leaves the glass bare just in these places. A solution of hydro-fluoric acid is then poured into these incisions, and, although it does not affect the wax, it quickly eats into the glass. When it has done so sufficiently, the acid is poured away and the wax cleaned off, and the process is complete.

As we have already stated, embossing is usually done after the bevelling, but the only reason being that when embossed the glass is much more valuable, and the danger in cutting down the edges is considerable, and the glass is sometimes broken in the process. As proof that there is no difficulty about it, it frequently happens that a little of the acid will run over the bevelled edges, destroying the polish. When this occurs the square is usually sent back to the bevellers to rub up the damaged edge again.

BRILLIANT CUT-GLASS

must not be confounded with embossed glass. The designs done in this way are upon glass polished both sides, i.e., quite clear, and are not done with acid at all, but cut with a very small emery-wheel similar to the method

adopted in making wine glasses, tumblers, and other cut-glass articles.

GLASS BEVELLING.

Glass which is going to be bevelled only, and not embossed, is the ordinary clear glass polished both sides. The glass as sent to be bevelled is cut to its exact size and shaped, as the bevel always follows the shapes to which the edges of the glass are cut. The more curved or intricate that edge is the greater effect produced by the bevel.

The workman gauges upon the sheet the width of the bevel he intends to give, and the superfluous glass is quickly removed by a revolving iron roughing wheel. These wheels or disks are not worked upon a horizontal but a vertical spindle, and revolve similar to a potter's wheel. The sheet of glass, if very large, is fixed upon a rest at the necessary angle to produce the proper bevel; this is pushed forward until the edge of the glass lies upon the surface of this revolving disk. If the squares are small enough the operator holds them in his hands and watches the progress through the glass. The advantage of bevelling the ground side is obvious, as he can easily see through the clear side, and can alter the angle without removing the glass from the disk. This only applies to glass bevelled on one side. If it is to be bevelled on both sides, as both sides are in that case ground, he has to adopt other and less easy methods to see when the edge is ground down sufficiently. This is the principal reason why the worker prefers to bevel the embossed side, but if it is specially ordered and paid for extra, there is no reason why the glass should not be bevelled on one side and embossed upon the other. The general opinion in the trade, however, seems to be that the bevel being highly polished forms a better contrast when done on the embossed side than when done on the polished side, as the bevel would be much less seen when the other side is obscured. After the principal portion of the superfluous glass has been removed on the iron wheel, the glass is removed to a bevelling stone, which resembles an ordinary grindstone, except that it is laid flat and revolves on a vertical spindle. This stone smooths the bevel, and it is then brought up to a brilliant polish by being rubbed by hand with pumice powder and rouge.

The opening ceremony in connection with the new Town Hall, Prestonpans, was performed by Mr. R. B. Haldane, M.P.

The Museum at Lausanne has been broken into by thieves, who have stolen a collection of medals of great value and various works of Art. Dealers will do well to be on their guard.

In the County Hall, Preston, a bust of the Queen has been unveiled as a memorial of the Jubilee. The bust has been executed by Mr. Adams Acton, and is said to be an excellent likeness.

The date of the visit of the Duke and Duchess of York to Glasgow has not yet been definitely fixed, but will be probably either the 9th or 10th of September. His Royal Highness will lay the foundation-stone of the new Art Galleries, to be erected at a cost of about £180,000.

The extension of the Promenade from East View to Bare White House, Morecambe, is being pushed rapidly forward, and the contractors have commenced the construction of the new entrance to the Morecambe Pier. The contracts for the electric light installation have been let. Application has been made to the Board of Trade for powers to borrow £4000 for the construction of a tramway along the new promenade to Bare.

The highest bridge in the world is said to be the Leo River viaduct on the Antofagasta Railway in Bolivia, South America. It is constructed over the Molo Rapids in the Upper Andes, between two sides of a canyon situated 10,000ft. above the level of the Pacific. From the surface of the stream to the level of the rails the viaduct is 636ft. in height. The length of the principal span is 80ft., and there is a distance between the abutments of 820ft.

Trade and Craft.

ACTION BY A SHREWSBURY BUILDER.

At the Shrewsbury County Court, before Judge Harris Lea, an action was brought by Henry Farmer, builder, Shrewsbury, to recover from John Davies, grocer, also of Shrewsbury, the sum of £20 16s. 6d., balance of account. Plaintiff deposed that in April, 1896, he received a bill of quantities respecting certain alterations to be carried out to defendant's premises in Castle Street, and sent in an estimate for £85 for the work, which was subsequently reduced to £83. The estimate was accepted, and as soon as the alterations had commenced he noticed that his foreman was doing work not specified in the contract, and he gave instructions for the time to be booked. The amount now claimed was the balance of account for extras. Defendant sent in a cheque for £10 in settlement of the claim, but plaintiff refused to accept it.—Verdict was given for the plaintiff, with costs.

ACTION BY A CONTRACTOR.

The case of Williams v. the Barmouth District Council was heard recently in the Divisional Court, before Mr. Justice Lawrance and Mr. Justice Collins. The plaintiff is a contractor, who constructed the Barmouth outfall sewer under a contract with the old Local Board. When the contract was completed he claimed £3417 18s. 1d. for the work, or over £1000 more than the contract price. The Local Board in November, 1894, compromised the claim, and agreed to pay £1080, £120 of which they paid at once, the balance to be paid in six months. Before the expiration of the six months the Local Board was superseded by the District Council, who refused to pay. The matter was referred to arbitration. The umpire, Mr. Rhys Davies, of Brecon, found for the contractor, and the District Council sought to set aside or refer back the award. After a long and complicated argument, both judges found against the Council, with costs.

UNDERGROUND LONDON.

The works of the Waterloo and City Electric Railway are being expeditiously pushed forward. The northern or up-tunnel has been completed for the whole of its length, including the station and siding tunnels at the Mansion House. The vast amount of excavation necessary for this underground station has all been carried out without disturbing the surface. The City Station tunnel for the down line has still to be executed, but it is hoped that this will be finished within the next six weeks. The engineers of both this line and the South-Western Railway have been carefully watching the under-pinning of the piers and buildings at the Waterloo Station, but no settlement whatever has occurred in the surface buildings. The greater part of the boring operations have taken place from a site on the Thames near Blackfriars Bridge, and the whole of the excavated soil has thus been rapidly carried away by boats.

A CARPENTER'S WAGES.

In the Westminster County Court a case arising out of the Jubilee was tried. Patrick O'Mara, a carpenter, was employed in May last by Mr. Hill, a builder, in the erection of Jubilee stands, when an offer came to him from another builder who was executing similar work for a wage of £5 10s. a week. Rather than lose the carpenter's services, Mr. Hill agreed to pay O'Mara 2s. an hour until the Jubilee was over. A day or two later O'Mara was discharged without notice, and he could then only get work at 10d. an hour. He now sued his master for the difference between 10d. and 2s. an hour for the period of a month.—The defendant said the plaintiff discharged himself, and further that he was only engaged by the hour. He had put up with a great deal from the plaintiff, and on the morning he left he had to remonstrate with him for "nursing" the job, whereupon he threw down his tools and said "I'm done, and you will have to pay me within an hour." The witness did pay

him, and upon his demand for another hour in lieu of notice, he gave him another 2s.—Judgment was given for the defendant with costs.

IMPORTANT BUILDING ACT DECISION.

At the South Western Police Court last week Mr. Francis gave an important decision in a summons against Mr. J. Schiefer, a builder, of Grove Mansions, Clapham Common, issued at the instance of the London County Council. The defendant was fined 10s. last March for erecting wooden structures at the rear of the mansions without the leave of the Council. As they were still allowed to stand he was further summoned for the recovery of the cumulative penalties. That summons, however, was dismissed, the magistrate being of opinion that the Council had proceeded under the wrong section of the Act. The Council accordingly issued a summons under Section 170, the effect of which is a magisterial order empowering the Council to enter the premises and demolish the illegal structure, and charge the defaulter with the expenses.—Mr. Chilvers supported the summons for the Council, and Mr. W. R. Warren, the defendant's counsel, raised the plea that his client, having parted with the property since his conviction in March, had no longer control over the structures.—The magistrate said the section of the Act clearly intended to reach the premises without reference to the owner or the occupier. Certain buildings were condemned, and the important thing was to demolish them. If the defendant would not do it, no question of ownership could stop the Council from carrying out the order of condemnation. He gave his decision in favour of the Council with two guineas costs.—On the application of defendant's counsel, his worship agreed to grant a case for the consideration of a higher court.

STRIKE AT SOUTH SHIELDS.

The plasterers of South Shields have come out on strike as a protest against the bricklayers doing work which is claimed by the plasterers as their right. For many years past the work of putting down cement flooring such as is used in back-yards, stables, sculleries, &c., has been performed by both plasterers and bricklayers, but the plasterers in Shields claim that this work is being done in other districts by plasterers alone, and they further assert that the plasterers' trowel and rule must be used for the job.

A REPORT has been presented to the London County Council showing the result of the erection of the Diamond Jubilee Stand. The stand was erected by the Works Department at a cost of £2150 7s. 4d., decorations cost £237, and refreshments £226 8s. The tickets sold were 2719 in number, and realised £3601 5s., and it is estimated that there will be a balance to the good of £738 13s. 7d.

The Birmingham Museum and Art Gallery has acquired temporary possession of a relic of the greatest historical and antiquarian interest, being a tapestry map of Warwickshire, executed at the Barcheston looms of William Sheldon in the sixteenth century. The scale is 3in. to the mile, and the map contains pictorial representations of the principal houses and Churches, towns and bridges, forests, roads, and even windmills and beacons.

At a recent meeting of the City Commission of Sewers it was referred to the Streets Committee to see that name-plates indicating the various streets in the City were fixed on both sides of the thoroughfares, and that the names were also painted on the public lamps in suitable positions to be seen at night. On the recommendation of the Finance and Improvement Committee, the Commission adopted an arrangement for acquiring the leasehold interest in Nos. 52 and 53, Newgate Street, for £10,500, also for securing the area in front of No. 35, Old Jewry, for £3000. In regard to an application from the Central London Railway Company for permission to proceed with the public staircases at the corner of Walbrook and Queen Victoria-street, no objection was offered.

SOCIETY MEETINGS.

York Architectural Society.—The members recently paid a visit of inspection to the extensive works of Messrs. Rowntree, in course of erection between the Haxby and Wigginton Roads, which are now approaching completion. The party were received by Mr. J. Wilhelm Rowntree, and the Architect, Mr. Fred Rowntree, of Glasgow, from whose designs the buildings and offices are being built. After passing through the various apartments the visitors were most hospitably entertained by Mr. J. W. Rowntree, and a cordial vote of thanks was passed on the proposition of Mr. George Benson, seconded by Mr. Arthur Pollard, for the enjoyable afternoon spent.

Somerset Archaeological Society.—The second day of the annual gathering was devoted by the members of this Society to excursions westward of Bridgwater. They first visited the Parish Church of Stogursey, which Mr. Buckle, the honorary diocesan Architect, described as a splendid example of Norman work. Stoke Courcy Castle was next visited, and Mr. Buckle said it was recorded that this was destroyed by Lord Bonville in the time of Henry VI. It was a matter of doubt whether it was ever a habitable dwelling. The next places visited were Dodington Manor and the site of Stowey Castle, respecting which an interesting paper was read by the Rev. W. Gresswell. Sir A. A. Hood believed that this old Norman stronghold was razed to the ground after the execution of Lord Audley, and the late Sir P. P. Acland had the foundation cleared. Cannington Church was afterwards visited, and also briefly described by Mr. Buckle, who said it was remarkable for having only one slate roof, which covered the entire building.

The memorial to the late Lord Tennyson, which it is proposed to erect on Blackdown, does not seem to receive the favour originally expected. The suggestion was to erect a summer-house on the hill near the poet's residence, but many friends and neighbours of Lord Tennyson have questioned the wisdom and suitability of the erection.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERSOCH (Carmarvonshire).—For alterations and improvements to Bwlch C. M. Chapel, Abersoch, near Pwllheli. Mr. R. L. Jones, Architect, Carmarvon.—£275

AUDENSHAW.—For the erection of class-room, St. Stephen's Central Schools. Mr. J. H. Burton, Architect, 2, Guide-lane, Hooley Hill:—
J. Whitehead £208 15 | Executors of T. Storer £191 10
J. Ridyard 208 10 | J. Pike and Son,
C. Evans 200 0 | Hooley Hill* 180 0
J. Clayton 194 0 | *Accepted.

BARRY (Glam.).—For the erection of school buildings, Barry Island, for the School Board. Mr. G. A. Birkenhead, Architect, Caledonian-chambers, St. Mary-street, Cardiff.

Quantities by the Architect:—
D. G. Price £2,873 0 0 | Jonathan Lewis,
Lloyd and Tape 2,847 17 0 | Cadoxton
D. Davies 2,795 0 0 | Barry* £2,753 12 3
James Jenkins 2,794 0 0 | G. & F. Couzens 2,749 10 0
*Accepted. [Architect's estimate, £2,708 2s. 8d.]

BECKENHAM.—For the execution of painting works, repairs, &c., Alexandra Schools, for the School Board. Mr. John Ladds, Architect, 7, Doughty-street, Mecklenburgh-square, W.C.:—

T. W. Jones £520 | Dennis and Jones £376
Syme and Duncan 510 | H. Heathfield, Kent
T. Cox 400 | House-road, Becken-
ham (accepted) 362

BIGGLESWADE (Beds.).—For the execution of sewerage works, &c., Pottton, for the Rural District Council. Mr. John W. B. Rooke, Surveyor, Council Offices, Biggleswade:—
W. Wade £333 0 | M. S. Kitteringham £279 0
Bartle and Son 287 10 | J. Jackson, London* 275 0
*Accepted.

[Engineer's estimate, £320.]
CARNARVON.—For the erection of school buildings, Carnarvon, for the Landwrog School Board. Mr. R. L. Jones, Architect, Carnarvon:—

O. Morris £765 | Edward Parry £750
Hughes and Griffiths,
Llanfair, P.G. Angle-

URBAN DISTRICT COUNCIL of BROMLEY.**SURVEYOR'S ASSISTANT.**

The Council are prepared to receive APPLICATIONS for the APPOINTMENT of a SECOND ASSISTANT in the Surveyor's Office, at a salary of £70 per annum.

Candidates must have a good knowledge of the surveyor's accounts prescribed by the order of the Local Government Board, and be competent to make surveys and prepare plans, and to discharge the other duties of the office under the directions of the Surveyor.

Applications, in the candidate's own handwriting, stating age, present appointment, and previous experience, with copies of three recent testimonials, endorsed "Surveyor's Assistant," must be delivered to me, as under, on or before TUESDAY, AUGUST 31st, 1897.

Personal canvassing will be considered a disqualification. By order.

District Council Offices, Bromley, Kent, July 28th, 1897. **FRED. H. NORMAN,** Clerk to the Council.

ARCHITECTURAL ASSISTANT (leading) WANTED, with special ability for designing and for preparing details.—Apply to **SAVILLE AND MARTIN**, Architects, 5, Arundel-street, Strand, W.C.

ARCHITECT'S ASSISTANT DRAUGHTSMAN REQUIRED. Must be neat and expeditious draughtsman.—Apply to **ARCHITECT**, 6, Whitehall-mansions, Archway-road, N.

BOARD of WORKS, WHITECHAPEL DISTRICT.

An ASSISTANT SURVEYOR, who must be a capable Draughtsman, is REQUIRED by the Board in the Surveyor's Department, to make surveys and take levels, and to undertake other general duties under the control and direction of the Engineer and Surveyor.

The appointment to continue during the pleasure of the Board.

Salary £3 per week, but no pension or compensation for loss or abolition of office will attach.

Applications by letter, enclosing copies of three testimonials, to be sent to the Office of the Board, No. 15, Great Alie-street, Whitechapel, addressed to the Clerk, on or before WEDNESDAY, AUGUST 25th inst., and marked outside "Assistant Surveyor."

Candidates will be pleased to note that their personally canvassing the members of the Board will be a disqualification for the appointment.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A.,

DESIRES to ASSIST others

in the

PREPARATION of DRAWINGS

at his own office.

G. SCORER, 28, Newman-street, W.

ASSISTANT (Disengaged). Five Years' experience; good designer and constructor, specifications, surveying, levelling, road-making, drainage, dilapidations. — **REYNOLDS**, Picton-place, Haverford-west.

FIRST-CLASS ASSISTANCE to ARCHITECTS. Twenty-five years' experience. Designs, perspectives, and other work, specimens, &c.—Address, "Pen and Ink," Office of the BUILDERS' JOURNAL.

LAND and ENGINEERING SURVEYOR. —General ASSISTANCE RENDERED. Land surveying, levelling. Estates laid out. Drawings and tracings made. Black line and blue point photo process at own office.—Address, **M. I. J. E.**, 3, Narford-road, Upper Clapton, N.E.

TO ARCHITECTS. —WANTED, by experienced Draughtsman, occasional WORK in Offices.—Apply for terms, &c., to **E. H.**, 9, Dumont-road, Stoke Newington, N.

ARCHITECT'S ASSISTANT desires **ENGAGEMENT.** Five years' experience (14 months in suburbs). Neat draughtsman, tracer, colourist, &c. Good general experience. Moderate salary.—**RITA**, 75, Guildford-street, Luton, Beds.

ASSISTANT (22) desires **ENGAGEMENT.** Two years in workshop and on works, three years with London Contractor, and nine months with Quantity Surveyor. Good writer and draughtsman, and knowledge of quantities and land surveying.—**B.**, 11, Pancras-lane, Queen-street, E.C.

APPOINTMENT WANTED by Young Man (holder of the Sanitary Institute Certificate) as **SANITARY INSPECTOR** or in any **SIMILAR CAPACITY** where a good all-round knowledge of sanitary work is required.—Address, **E. M. RAINBIRD**, 57, Biggin Hill, Upper Norwood, Surrey.

CLERK of WORKS seeks **RE-ENGAGEMENT.** Town or country. Just finishing new brewery under well-known Engineers. Good references. Well up in all branches.—**W. W.**, 33, Villiers-street, Leamington.

No more Accidents caused by Worn Steps.
THE PATENT

Interchangeable RUBBER STAIR TREADS

Prevent Slipping, and are Perfectly Noiseless. Gold Medal, Life Saving Exhibition, London, 1886. Highest Award, International Fire Tournament, London, 1896. These Treads consist of a metallic keeper fitted with india-rubber blocks (specially prepared), which project above the metal and form the wearing surface, and which can be renewed when worn. Can be fixed by anyone in a few minutes. Specially designed for Hotels, Clubs, Factories, Warehouses, Ships, Yachts, &c. Give a firm footing in all weathers. The best and cheapest in the market. Prices on application to

Best Quality!

Low Price!

Municipal Folly!

OUR municipal authorities are of a practical turn of mind. This is a quality by no means to be despised; but, when public works are under discussion, it is necessary that it should go hand-in-hand with an instinct for Art. Let us examine two instances in which this quality has been exhibited with entirely different results. Notice the letter-boxes at the street corners. They are admirably adapted to serve their purpose. They are a convenient height for posting letters, and no higher. They are wide enough to hold a sufficient number, but not wide enough to seriously interfere with the traffic. They are circular on plan, a form best adapted for crowded thoroughfares, as it takes up the least possible room and presents no angles; it is also the strongest form for any given amount of material. Some are octagonal, but the circular are better. There is a slightly projecting base, so as not to interfere with the feet of passing pedestrians, and the whole thing is finished off with a sloping top or roof, which projects just far enough to obtain a throating to throw off the water, the projection being kept flat in section to minimise the effect of a blow to anyone who might happen to stumble against it. Being objects that should be easily noticed and be as conspicuous as possible, and which it is necessary at the same time to keep as small as possible, they are painted red, and by no means an unpleasant red. The projection of the base being so slight it would be unnoticeable if painted the same colour. These bases are painted black, which gives them sufficient importance, and suggests a connection with the ground. The red colour, besides attracting attention, gives just the note of colour our dull grey streets require. It may be they are painted red because this is the official colour, but let us give them the benefit of the doubt. Now this is Art, though of a primitive sort, which needs to improve its means of expression. On these lines an Artist who understood the material employed could produce fine Art. It would be better for us if all our buildings were as reasonable. This practical common-sense is not exhibited in the street fire-alarms, where we see a carriage-clock stuck on the top of a diminutive doric column. Let us turn rather to the statue of the Hero of Waterloo, in front of the Royal Exchange. In a moment of enthusiasm this monument was erected to commemorate the benefits that London and the whole country—indeed, Europe at large—have reaped from his genius and his valour. The idea of this was right, it was put in the right place, and it was Art; not perhaps of the greatest, but still it was Art. At first it was felt that the warrior's great reputation, and the aforesaid benefits, sufficiently justified the existence of the monument. But a generation arises that has not the fear of Napoleon before its eyes, that takes no personal interest in the hero. When enthusiasm dies out the practical turn of mind comes in. An underground convenience is required in this central position. Space is limited, there is no room anywhere—where to put it is the question. Some practical genius, who deserves to be Lord Mayor and a baronet, was struck with a brilliant idea. "There is Wellington sitting out in the middle doing nothing

in particular, of no practical use to anyone, and in the very place we want. Put the underground convenience round the base of his statue, with the little stair at the back well out of the way, where it takes up no room. By so doing, we get it in exactly its right position, we interfere with the traffic hardly at all, and Wellington at last serves a practical purpose; he serves to mark the spot."—This emphatically is not Art, and nothing can ever make it so. It is

England to drift into Romanism, not the real thing, but a "mongrel mock-turtle" kind of Romanism. Is there a single word in the whole of the English language better qualified to express the idea of a sham to a company of City dignitaries than "mock-turtle"? What a connoisseur in epithets! What a sense of the fitness of words! Surely such a man would have an equal sense of the eternal fitness of things, and to him we appeal to wipe away this reproach, to remove that

THE NATIONAL COMPETITION.

a *bétise*, of which probably no other people on the face of the earth could be capable. The utter lack of imagination and good taste which it shows is not to be expressed in words. The report of a recent speech at a meeting of the Common Council, the Lord Mayor presiding, leads us to believe that there is an Artist in that eminent body, and to him we appeal. Apropos of a vote in aid of the restoration of a Cathedral, he remarked that there was a tendency on the part of the Church of

underground convenience elsewhere, even at the risk of making it an inconvenience. Considering that in all London there are less than sixty commemorative monuments, it would certainly be a curious commentary on the value and scarcity of available space in the public roadway if it were found necessary to erect its statues over public conveniences, or rather to construct its conveniences under its statues. There is something particularly at variance with the fitness of things in the latest municipal proposal.

OLD BUILDINGS IN DEVONSHIRE.*

A PROTEST AGAINST VANDALISM.

By JAMES HINE.

WE cannot, I think fail to recognise the respect for Nature shown by the old moorland builders. Their Churches, whether at Widdicombe, Walkhampton, Brent Tor, or elsewhere, never mar the beauty of the landscape, but, on the contrary, enhance it, and no Artist would rather be without them. And even the old farm buildings, with their thick and low granite walls, steep thatched roofs, and rudely shaped chimneys, are in harmony with the scene around. There are not very many of them left, but they are very picturesque. It may be hoped that the proposed acquisition of the Forest of Dartmoor, or what remains of it, by the County Council is gradually approaching a practical stage. With that acquisition, not only would the preservation of prehistoric remains be guaranteed, but the repetition of such buildings as I have alluded to—which are fatal blots on moorland scenery, but which may be expected to follow all new enclosures—would be once arrested. I am sure it is the desire of this Association that Devon should have her Forest of Dartmoor whilst there is beauty to preserve, and before it is too late. Perhaps the most deplorable of modern introductions—from the point of view we are considering—is corrugated iron, which has not only largely superseded thatch, but also the old Devonshire mode of covering buildings with small slates and then interlocking them, as it were, in the valley gutters, rendering lead there unnecessary.

THIS IS NOW A LOST ART.

Fine specimens of this kind of slating may be seen on Mr. Midmay's buildings about Flete and Mothecombe, and on Mr. Tremayne's grand old Elizabethan house and out-buildings at Sydenham, where nothing can be more lovely in colour than the sheen of yellow and orange lichens on the old slates. The preservation of the ancient buildings of historic towns is, it is almost needless to say, of paramount importance. At Chester there are laws—as unalterable as other codes so oft quoted, but yet so invaluable as early precedents—affecting the maintenance of the good old building customs of that city. Might not similar laws be usefully adopted for the preservation of the ancient buildings of such towns as Exeter, Totnes, and Dartmouth? It was very gratifying to read a few weeks ago, that the Totnes Commercial Association "recommended, as worthy of consideration, the preservation and protection of the style and character of ancient houses of the town and district." There is a good conservative ring about that resolution, and would that a similar one had been adopted by many towns, including Totnes, at the beginning instead of the end of the nineteenth century; but better late than never, and opportunities of carrying it out will no doubt occur in the twentieth century. Totnes is our "Devonshire Chester," and has much left of fifteenth, sixteenth, and seventeenth century work. May it long continue, marking the importance of the town at those periods, and the value attached then to the beautiful as well as the useful. We have heard occasionally (though not quite lately) with astonishment, no less than regret, rumours of the contemplated destruction of the Butterwalk at Dartmouth, that grand old example of

JACOBAN STREET ARCHITECTURE;

and we have asked, "Can it be possible?" because it seems almost incredible that the town should entertain the idea of sacrificing a building so handsome and full of interest, so attractive to strangers in general and artists in particular, and the only important memorial, in stone and carving, left of Dartmouth in its palmy days. What a blank it would leave, and what would the town be without it? Let us hope there is no truth in the rumour that the destruction

of the famous bridge of Bideford is in contemplation; for a more vandal act could not be perpetrated; and it is very hard to believe that any Bideford man could be a party to the obliteration of his town in all that is most attractive and interesting. Bideford, since the fourteenth century, has undergone various

SO-CALLED "IMPROVEMENTS."

Now, as then, it has twenty-four massive arches; but long ago it lost its chapel and spire on one side, its bell-tower and gateway on the other side, and over the central pier the shaft and capital bearing high the figure of the Blessed Virgin with the Divine Child. What a marvel of beauty Bideford Bridge must have been four centuries ago! The parapets have undergone at least two alterations in comparatively modern times, and in the last changes, which took place, I think, about thirty years ago, when the overhanging footways were formed, the quaint V-shaped recesses, which we still see in a few remaining old Devonshire bridges, were entirely done away with here. But Bideford Bridge still retains its noble arches and piers, and the wonderful interest attaching to a long and unvalued history, and surely the town will not part with such a great possession. From Newton Abbot, and Liskeard in the adjoining county, the cry comes, "Down with it! Down with it! Why cumbereth it the ground?" And not unlikely, when twelve months hence we tell the towers thereof, we may find one of them missing. But St. Leonard's Tower had a prior history, and was between two and three centuries old when the Dutch Prince landed at Torbay; and the pity is that it ever lost the interesting little chapel, with its carved fifteenth-century seats, and probably much older font, formerly attached to it; but Newton Abbot cannot afford to lose its venerable tower, which is still useful as well as ornamental, and which possesses, it is said, for I have not heard them, a musical peal of bells. A very warm controversy has been going on in reference to the restoration or destruction of

THE NORMAN TOWER AT LISKEARD.

It has arisen out of a competition which was invited for designs for a new tower. I have not seen any of the drawings submitted, and can therefore give no opinion on the design which it is understood has been adopted. But it is the proposal to take down—when it has been shown to be unnecessary—a very early tower of almost unique interest which so staggers one. Llandaff has its ancient tower on the north side of the west end, and its new tower with spire on the south side, and the grouping of the old and the new is satisfactory there, as it could be at Liskeard. There is one thing which cannot be avoided, the renewal of utterly decayed masonry on the exteriors of Cathedrals and Churches. I daresay many present have lately noticed that a large portion of the stonework of the west front of Exeter Cathedral, including the great west window,

IS UNDERGOING RENEWAL.

I do not presume to question the judgment of the eminent Architect, Mr. Pearson, under whose direction this work is being done; the new stone facing is no doubt an absolute necessity, but it is a sad necessity, and it will be many years before the venerable façade recovers its harmonious tone. We enter the nave, Bishop Grandisson's great work. The piers and arches were scraped (a somewhat dangerous, if necessary process) in Sir Gilbert Scott's restoration; but here and there are portions of masonry—the lower parts of the vaulting shafts, some of the carved corbels under, and parts of the minstrels' gallery—which, with the remains of the original polychrome, were judiciously left undisturbed; and to my mind they are the most impressive and interesting fragments of the whole interior. These are indeed the touches of the vanished hands of those who five centuries and a half ago were engaged on this sublime work. Be assured that the secret of the interest and value of ancient buildings lies in such touches of vanished hands—the

very work as left by the old masons and craftsmen. May I be permitted, in conclusion, to express a desire that the increasing influence of our Association may be employed—by protest, appeal, and in every possible way—against the further violation of Nature, and the destruction or mutilation of prehistoric remains and ancient buildings in this county? The conservation of what is so precious is quite consistent with a hearty desire for real progress. Very barbarous things have been done; but there are signs of reaction, indications that the tide of public opinion is setting in strongly in favour of the preservation of places of historic interest and natural beauty; to redeem modern civilisation and education from still sadder reflections.

OUR ILLUSTRATIONS.

COMPETITION DESIGN FOR THE WESTWOOD HIGHER GRADE SCHOOL, SCARBOROUGH.

THIS design was submitted last February by Messrs. Unsworth and Newberry. The site is a fine one, sloping rapidly to the south-east, and adjoins the Public Park. It was intended to keep the school buildings on the north-west of the site, the principal elevation thus facing the park. Playgrounds were arranged on the south-west and north-east sides of the school, and would be levelled from retaining walls built flush with the projecting wings of the building. This would leave a space next the park capable of being laid out as an ornamental garden. Reference to the principal floor plan will show that the class-rooms are all lit from the left hand, and grouped around the central hall on three sides only. This arrangement gives them a northern aspect as far as is possible, and enables the hall to be side-lit from the south-east, so that the sunlight may penetrate across its entire width. It was found quite impossible to design the dignified and substantial building required by the conditions for the stipulated sum unless the plan were arranged in the most compact manner possible; for this reason the boys' and girls' entrances and cloak-rooms are placed on the mezzanine level, immediately below the principal floor. The library, headmaster's room, stores, unpacking room, &c., are also on the mezzanine floors. A special feature of the design was the treatment of the central hall. The conditions set forth that it should contain a floor area of 3600 square feet. This was found to give too much space in the basement and upper floors, and increased the cube of the school to such an extent that it appeared impossible to build it for the stipulated sum. A hall was therefore designed, of a superficial area of 2680 square feet, capable of being extended in a few minutes by throwing into it the class-rooms at either end. The required area was thus obtained, after allowing for placing the class room desks against the end walls, as well as additional light and ventilation. It is understood that the central hall is only occasionally made use of, and that it is never used simultaneously with the class-rooms. Everything, therefore, seems in favour of this arrangement. The materials intended to be used were red brick facings, with stone dressings and bands; the roofs to be covered with green slates, and the flèche with copper or lead. The warming and ventilation was very carefully thought out, the system adopted being a modification of that known as the "Plenum." The estimated cost amounted to £16,590.

THE ARCHITECTURAL ASSOCIATION TOUR IN LANCASHIRE.

THE drawings of Oak Chimney Piece, Levens Hall, reproduced in our last issue, were by Mr. E. P. Milne, of 100, Shaftesbury Avenue, formerly of Lancaster. By an error Mr. Milne's name was spelt "Milner."

* An address delivered by Mr. James Hine, President of the Devonshire Association, at the annual meetings recently held at Kingsbridge.

THE NATIONAL COMPETITION, 1897.

By OUR SPECIAL REPRESENTATIVE.

Illustrated by Sketches by E. A. RICKARDS.

IN spite of the optimistic tone taken by my editors in a recent cursory notice, I find it difficult, after a very careful examination of the various works now on view at South Kensington, to rise to a corresponding enthusiasm.

It is true that there is much to be commended amongst the designs for flat decoration, fabrics, &c., but those of us who remember the various models exhibited last year by the Misses Lillian Simpson, Florence Steele, and Eleanor Mercer will search in vain for work by any such pioneers of design in the round. It is this lack of form which is so painfully absent throughout the entire Competition. Possibly, as Architects ourselves, we look first, in such an exhibition of applied art, for such objects as may serve as accessories in the modern building; but is not this the right point of view?

I have tried to conceive the Architectural setting to one or two of these accessories, but with poor success—a vision of the styles from Hindoo to Early English, with a nightmare of the figure misapplied; for in all those designs which are ambitious enough to come under the heading of Architecture the fault will be found. We know those designs—they come from Glasgow, invariably.

In view of the large areas represented by some of the schools, one cannot help thinking of the good that could be brought about by the appointment of an Architect, or, perhaps, of a series of architectural visitors who would not only have some influence in their own department, but would be listened to with regard to some other branches. A man cannot be Jack-of-all-trades. No one could possess all the qualities necessary to advise and assist all of the many sections of students in a large Art School. We in London have better opportunities. The architectural students have their Architectural Association, and latterly they have been given the opportunity in the County Council School of Arts and Crafts of attending an Architectural School within an Art School with its own professors, who are masters of their own particular Craft. This is an example to be commended to the larger of our provincial Art Schools.

The influence of such specialists on the designs intended for the furnishing of buildings would be inestimable, and the *bond-fide* architectural student would, perhaps, be better advised than to submit works which, however clever they may appear on paper, are imprac-

ticable to the last degree. We do not wish to shock the susceptibilities of any earnest and well-intentioned Art master, but some of the designs this year for furniture, such as fire-places, cabinets, and other fittings, which we presume to have been worked out under the advice of some one or another of the fraternity and hall-marked by the examiners by awards

to our examination again, is well advised in studying his design in the round by means of a model, especially such a subject as a fountain. One is bound to admit, though, in this case the drawing is more suggestive than the model (shown by a photograph), in which it looks more the work of a painter-designer than an architectural designer. There is little else

MODEL FOR
CASKET
OMAR RAMSDEN

of bronze, silver, and gold medals, prove the system decidedly at fault. An instance of this kind may be noticed in the award of a gold medal for a particular set of designs. I have sufficient belief in the advance of public taste to think it would not pass muster at the hands of Sir Tottenham Court Road. It would be too impossible even for him.

I should find it too wearisome to give a detailed account of the Architectural designs, but Mr. George A. Paterson, of Glasgow, deserves special notice for his design for a memorial chapel. It is not often one sees such a sober treatment that hails from Glasgow; perhaps, however, its author was kept within bounds by the fact that it was submitted originally for the Alexander Thomson studentship. The design needs a perspective, in spite of Mr. Paterson's most understandable drawings. The examiners would have done well to have added a note to the effect that this style of workmanship is to be commended, and to have asked for more—as they occasionally do in some other departments. Mr. William Haywood, of Birmingham, who receives a gold medal for his Pugin drawings of last year, now submitted

to arrest notice in this department; but, in view of the extreme youth of the majority, it were kinder to pass on.

The award of a gold medal to Mr. Arthur Baxter, of Leicester, for a study for a library with its fittings, is one to which most will agree. The shelves are shown in a double row immediately above the dado, thus leaving a pleasing expanse of wall above. The whole of one end of the room is formed by a semi-circular bay, filled, however, with very badly-proportioned glazing. The transome is also at an ugly height. Had it ranged with the top of the shelves which run round the remainder of the room, it would have harmonised with the whole effect, and also have been the making of the window itself. In execution it would be found better to have had a continuous panelled dado. The chimney-piece is an interesting piece of design, quite in character with its surroundings, but this would have been better with its top cornice running through; and in the same way one would rather prefer to find the top line of shelves unbroken, thus giving due prominence to a feature like the fireplace. Anyhow, Mr. Baxter's is an exceedingly praiseworthy effort.

MODEL of
MACE
OMAR RAMSDEN
SHEFFIELD

AWARDED SILVER MEDAL

His drawings in themselves are amongst quite the best things there. There is much that is suggestive in Mr. Gillick's sketch model of a fireplace (a rough sketch of it accompanies this article), but his detail model disappoints one. Mr. Gillick has expended all his labour on the figure itself, which is good enough—excellent in fact—from a sculptor's point of view; but it might belong anywhere, and the

year indeed of the Competition. One thing I have omitted. Mr. Harold Nelson shows two frames of black and white designs in his best manner. He is a master of good lettering, and has some wonderful drawings in some of the plates. A gold medal he certainly should have had if only to separate him from others who have received silver medals, and whose work is really mediocre in comparison.

Chaucer; the very name of the Black Swan in Holborn suggested the four days' journey to York; the double court of the Belle Sauvage in Ludgate Hill was a place of residence as well as a starting and arriving place for coaches; every one in the London of Queen Anne knew that the great Grinling Gibbons lived there. These and many others were as familiar in our fathers' mouths as household words, as familiar as the names of our railway stations, Charing Cross, Cannon Street, Euston, St. Pancras, Waterloo, are now. Indeed, these old coaching inns were to the Londoners of the coaching days what the railway stations of modern London are to us.

THE DECADENCE OF THE OLD INNS.

But already in 1837, the accession year of the Queen, the year of "Pickwick," the old inns had seen their best days. The tenth chapter of that immortal work introduces to us Sam Weller, in the yard of the White Hart, High Street, Borough, which was then, as Dickens says, one of "some half-dozen old inns which have preserved their external features unchanged, and which have escaped alike the rage of public improvement and the encroachments of private speculation. Great, rambling, queer old places they are, with galleries, and passages, and staircases wide enough and antiquated enough to furnish materials for a hundred ghost stories." Sixty years of continuous public improvement have passed since those words were written, and the curious antiquarian could not now find, even in the obscurer parts of London, anything like the yard of the White Hart as Dickens saw it. The Old Bell in Holborn, one of the last of the galleried inns, has been doomed to destruction this very summer. But although the spacious yards of the old coaching inns have been requisitioned by modern London for modern purposes, there still exist many of the smaller inns of old times sacred to deep drinking and high thinking, especially in the last century, when tavern life was in its glory and the wits of our Augustan age worthily perpetuated the manners and customs of a still greater age

rest of the chimney, with all its opportunities, is apparently lost sight of. This is a pity, for at the first glance it has very considerable possibilities.

The wall fountain by Mr. Frank Marriott is marred by the basin, the character of which does not accord with the remainder, and this would be the more evident in execution, as it is intended, no doubt, to be a model for a fountain two or three times the size shown. To the panel and framing to the panel above the basin is undoubtedly due the award, and this in itself fully justifies it. The lettering over the panel is excellent. The modelled design for a set of electric bell pushes by the same author speaks for itself in the sketch given.

There is little else that rouses one beyond the full-size sketch model for a mace by Mr. Omar Ramsden, of Sheffield (the sketch given cannot, of course, give its full effect, and that of such parts as the coloured panels in the head), and the very charming model for a bowl by Miss Emily Arthur, of Glasgow, who obtains a bronze medal.

I remember, however, a very charming circular dish by Harry Theaker, of Burslem, which unfortunately has not been sketched for this article.

Amongst the metal work is to be found the usual number of wrought-iron gates sandwiched between more than ordinary stone and brick piers—work which shows an infinite labour, but depressing results.

Miss Kate Roberts, of New Cross, deserves mention for her sheet of designs for brasswork candlesticks, &c.

There are two interesting attempts at wood-staining by W. F. Blogg and F. R. Willeirs, of Chelsea, who gain silver and bronze medals respectively. The former's work too nearly resembles wood inlay.

I have no space to deal with the decorative designs in the flat, such as wall papers, cretonnes, &c., at least in a comprehensive manner, yet I must congratulate Mr. Geoffrey Alan Baker, of Canterbury, for his wall paper and frieze design, with which he has gained a gold medal. The figure in the frieze would, however, be rather swamped in a room of any size.

Newcastle sends excellent work in this class, and gains four silver medals, Miss Meta Lovgreen and Miss Elizabeth Davies scoring heavily in their designs.

Miss Mary Houston's stamped leather can only be compared with itself. It is the only work of its kind shown, and fully deserves the notice it has received in the shape of a silver medal. This lady also has by far the most charming design for a damask cloth in the Exhibition.

Beyond the time studies by H. Watson, of South Kensington, and some interesting poses of children by Albert Jackson, of Holloway, there is little to notice amongst the life drawings; but this subject is scarcely within Architectural criticism, and gives me the cue to end this notice of a very average

DISAPPEARANCE OF OLD LONDON INNS.

ONE by one, as they are swept away, the ancient taverns of London are fast disappearing before the march of modern improvement. No sooner has one well-known old hostelry fallen beneath the pickaxe than the turn of another comes. The quaint old-galleried inns of London could be counted by the score at the beginning of the century, and they were then, as they had always been, centres of travel. Their courtyards resounded with the clatter of hoofs and the rumbling of coach-wheels; their rooms were always full; their tables were crowded with hungry travellers; their names and their landlords were famous throughout the town. The Tabard in Southwark was as well known to our grandfathers as it was to the generation of

NOTTINGHAM

which knew the Mermaid as the literary centre of London.

THE MAGPIE AND STUMP.

On the eastern side of Fetter Lane, nearly opposite the old White Horse, stands a public house, at which the casual passer-by would not give a second look, so absolutely commonplace is its red-painted, stuccoed exterior, unless, perchance, his eyes caught the words on the glass of the door: "Ye olde Magpie and Stump. Established 1600." Established 1600! An Elizabethan tavern, then, if the words speak truth, contemporary with the Mermaid itself, when Shakespeare was living not far away in Blackfriars? And so it is assuredly, not the identical Magpie and Stump as it appeared when first established, but still to a great extent the original house. Altered in the last century, altered in this one, it is still, in its internal arrangements, what it was on a momentous day in 1643 when London was ringing with the news of a great conspiracy in Fetter Lane and the arrest of traitors at the Magpie and Stump. And now they say the old house itself is to disappear, after close upon three hundred years of a chequered career, but there are no visible signs as yet of coming dissolution.

HIPPERHOLME COUNCIL OFFICES.

OF the ten sets of plans submitted for the proposed new Council offices, those of Mr. J. F. Walsh have been unanimously selected as the most suitable. The site for the new offices is being purchased from Messrs. Joseph Brooks and Sons. It has a frontage to the Leeds and Whitehall Road, is close to the old offices, and is well adapted for the purposes of public offices, with store yard behind. The plans show a two-story building in the Renaissance style. The site for the offices contains an area of 691 yards, the back portion for store yard having an area of 993 yards. On the ground floor is the principal entrance, 8ft. wide, with well-lighted hall, in which is the principal staircase. There are the surveyor's and collector's rooms on the respective sides of the entrance hall, 15ft. by 21ft., with plan room and strong room adjoining, also waiting-room, lavatory, and conveniences. The spare room may be used by the clerk, medical officer, or registrar, and adjoining this is the caretaker's house, which has

DISTRICT COUNCIL NEW OFFICES, HIPPERHOLME. J. F. WALSH, ARCHITECT.
ELEVATION TO LEEDS AND WHITEHALL ROAD.

a frontage to the side street, and is provided with sitting room, living room, scullery, bedrooms, and bathroom. The whole of the basement is cellared, and can be approached by a separate entrance from the side street and the back yard. Is intended to be used for lamp and general stores, plumbers' shop, and spare room, which can at any time be adapted for public slipper baths. On the first floor is the council room, 20ft. by 35ft., lofty and well lighted from the front and end, with panelled ceiling. Adjoining are the committee room, measuring 20ft. by 16ft., press room, 11ft. by 13ft., cloak room, lavatories, &c.

The staircase and landing are well lighted, and are to have seated recesses on each side. Over the board room are attic storerooms for the offices. The building will be built of local wall stones, with ashlar dressings and ornamental terra-cotta panels. The roof will be covered with green Buttermere slating, the Council Chamber will be finished in polished oak, whilst the rest of the woodwork will be of pine. The entrance hall floor is to be laid with mosaic, and the walls are to have a dado of ornamental tiling. The warming will be upon the most improved system of low-pressure water, with ventilating radiators and self-acting exhaust ventilators. In the yard behind the building provision is being made for the erection of an ambulance carriage house and store sheds. Provision is also being made for the erection at some future time of a road foreman's cottage, with stabling, cart sheds, and mortuary. The total estimated cost is £2000, and it is proposed to proceed with the works as soon as the sanction of the Local Government Board has been obtained.

HIPPERHOLME NEW DISTRICT COUNCIL OFFICES.

LAST week the Bishop of the diocese, in the presence of a large congregation, dedicated the new altar, east window, choir stalls, and organ at St. John's Church, Buxton. The window is from the studio of Mr. C. E. Kempe, of London, and depicts the Crucifixion; the organ, a four-manual electric instrument, by Hill and Son, of London.

In the peristyle of a house at Pompeii recently excavated two fine wall paintings have been found, probably transferred there from some other building. One of them represents a poetess reading to a female musician; the other a young girl leaning against a pillar, and conversing with a girl seated and wrapped in a large mantle.

THE contractors for the erection of the new Great Western railway station at Windsor have commenced the demolition of the old waiting-room which for many years has been used by the Queen, the Princes and the Princesses of Her Majesty's family, and the imperial and royal guests visiting the Castle. This salon, although small in its dimension, has been the scene of many historical events connected with the Queen's family, especially upon the occasion of royal receptions, departures, marriages, and funerals.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
August 25th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE contemplated demolition of the old buildings in Church Row, Hampstead, has called forth a vigorous protest. "The speculative builder, who is for ever going about the face of the earth seeking what he may devour, has now come to Church Row, and as I understand," writes a second correspondent, "is about to put his cloven foot into the pleasantest of quiet corners. It is one that most of us know, where many generations have found harmless satisfaction and peace, where Mrs. Barbauld dwelt, where Joanna Baillie, Walter Scott, Charles Lamb, and Du Maurier have trod in turn. Church Row is a place which no one ever thinks of without kindness and admiration; when it is knocked down, when teeming flats, built by contract and made beautiful by Linerusta ornament, stand in its place, how little shall we have in return for a very unique and beautiful thing, which all the speculative builders in the world will not be able to put up again."

SOME very curious and interesting relics of bygone ages are occasionally dredged up by the men employed by the Thames Conservancy Board. Not long since the head of a stone tomahawk (a roughly chipped piece of flint) was found, with a number of horns. A handsome bronze sword in a fine state of pre-

SECTION ON LINE A.B.

HIPPERHOLME NEW DISTRICT COUNCIL OFFICES. J. F. WALSH, ARCHITECT.

servation was recovered from the river some years ago, and was presented to a museum in Berkshire; but the most interesting, if not the most valuable, find was a bronze helmet, a portion of which had been gilded.

It is announced that a commencement will soon be made with the important structural alterations at the South Kensington Museum. The notorious "Brompton boilers," which have for so long been allowed to disfigure that part of the Cromwell Road, are to disappear at last, the First Commissioner of Works having officially informed the Science and Art Department that the work of demolition will be begun forthwith. The iron buildings which were erected three years since in the quadrangle in the very heart of the Museum, and which have been regarded as a serious source of danger from fire, are also doomed, and will at once be pulled down. Other structural changes have been decided upon with a view

to reducing the risk of fire. These works are consequent on the interim report of the Select Committee, and have, of course, no bearing on the question of the erection of a front for the Museum—a question which is not likely to be settled for some years to come.

VESTRYMEN of Westminster lately laid their heads together on the subject of street-paving, but wood has not been the result. On the contrary, after some rather enthusiastic discussions, they have decided to put down asphalt in Victoria Street. The considerations which have induced them to adopt this material are its greater durability, lower cost of maintenance, the increased facility with which it can be kept clean, and the example of the City of London in retaining its use. It is also asserted that it is less noisy than rutted wood, and but slightly more dangerous for horses. These arguments are, however, being vigorously combated by a section of the citizens, and for humane and other reasons a petition against the laying of asphalt in Westminster is being organised by Mr. Arthur J. Coke, the secretary of the Dumb Friends' League. The main argument in this document is that asphalt inflicts grievous suffering on beasts of burden, is dangerous to life and limb, and particularly unpleasant in the hot weather. The Westminster Vestry anticipates one of these arguments by declaring that its first regard is for the ratepayer and not for the horse-owner. Wood-paving in a thoroughfare like Victoria Street lasts only seven years. Asphalt is said to have a lifetime thrice as long, and on this account to enable vestries to command easier borrowing terms from the London County Council.

MR. BROOK, R.A., and Mr. Jackson, R.A., are making satisfactory progress with the Benson memorial for Canterbury Cathedral. The memorial takes the shape of a mausoleum, with a recumbent effigy of the deceased Primate, and a canopy; and Mr. Brock is doing the figure, and his brother Academician the main structure. This will absorb about £2000, and the balance of the fund, amounting to another £2000, is to be handed over to the Truro Cathedral Building Committee for the completion of some portion of that edifice. The work on which the money will be expended has, however, not yet been settled.

If price determines the value of pictures, then Professor Herkomer's "The Chapel of the Charterhouse" is the finest of the Chantry Bequest works, the trustees having paid the Artist £2200 for it. The only other oil paintings for which they paid anything like that sum were Vicat Cole's "The Port of

HIPPERHOLME NEW DISTRICT COUNCIL OFFICES.

London," and Orchardson's "Napoleon on Board H.M.S. Bellerophon," for both of which they gave £2000. In sculpture we find £2200 paid to Mr. Thomas Brock for his bronze "A Moment of Peril," while £2000 was the price of Lord Leighton's large bronze statue "An Athlete Struggling with a Python." These works are all now at the Tate Gallery, with the remainder of the Chantrey Bequest pictures, including the David Farquharson they bought this year.

THERE seems to be a considerable conflict of opinion among French artists as to the effect which the American tax on Art is likely to have on the demand for works produced in the Paris studios. Some of the leading painters view the imposition of a duty on imports of an Artistic nature with a certain degree of favour, as they argue that a 20 per cent. tax will not check the sale to American collectors of really fine productions, while it will put a stop to the flooding of the American market with bad canvases. Others regard this form of protection as certain to fail, because its effect will be felt, not by the foreign Artist, but by the buyers in America who cannot satisfy their æsthetic inclinations with home productions. But among French illustrators who have of late years found for their work a ready sale to American magazines there is much more feeling of alarm. With only a few exceptions they agree that the new tariff will seriously affect them; and they anticipate a marked falling off in their chances of placing profitably in America drawings for illustration. For this anticipation there certainly seems a good deal of reason.

THE excavations that have been going on for months past on a plot of ground belonging to Herr Schabb, a manufacturer at Treves, have resulted in the discovery of a Roman private house, which will excite the interest of antiquaries almost as much as the famous public buildings at Augusta Trevirorum. The front of the house lies parallel with the principal street of the old Roman city. A number of blocks which served as pedestals for the wooden or stone pillars of a portico still remain. The entrance is distinctly recognisable between two buttresses and an immense heap of stones. A long entrance hall running right through the house, from front to back, is intersected by another corridor, so that the gigantic building is divided into four parts. Side corridors lead into the rooms. Of these, the marble tessellated bath-rooms for hot and cold water and warm air lie side by side, and deserve special mention. The two latter were supplied with warm air through subterranean passages. The escape of the smoke was effected by means of hollow tiles laid on one another. The south-western rooms have cellars under them. In a light court in the same part of the house there is a well-preserved window, the first ever found in a Roman building. The most interesting thing, however, is the magnificent and richly-coloured mosaic floor, a rarity of the first order. Experts assign the building to the first half of the fourth century, when Augusta Trevirorum attained the zenith of its splendour under Constantine and his sons.

A CORRESPONDENT recently called attention to the fact that the restoration of St. Bartholomew-the-Great was still incomplete. "A considerable portion of the Church, he said, was as yet unredeemed, and in excellent preservation in the occupancy of Mr. C. Richards, farrier, Coach and Horses Yard, Bartholomew Close, by whom it was used as a stable. The remains referred to consist of some old arches, which are, we believe, the remnants of the cloister. The only obstacle to the restoration of this part of the original structure is, we presume, the expense. There has been considerable difficulty in raising funds for the work already done.

REFERRING to the National Competition at the South Kensington Museum, of which we give a notice elsewhere, Mr. S. J. Cartlidge, of the Society of Art Masters, says:—"Just now,

when some of the fitful attacks of perverse criticism directed against the Department of Science and Art have been to the fore, it is interesting to observe healthy and vigorous signs of appreciation of the valuable service which this much-abused Department has accomplished for the Art of our nation. Striking and unquestionably weighty testimony to this nationally beneficial work was borne at the annual dinner of the Society of Art Masters recently held at the Holborn Restaurant. Amongst the principal speakers were Sir Thomas Wardle, M. Solon, and Mr. J. J. Shannon, A.R.A., all experts, and familiar with the conditions of Art instruction. Sir Thomas Wardle, speaking as a manufacturer of Art fabrics, and as an undoubtedly high authority upon silks and silk productions, told his interested hearers how his former experience of the unsaleable nature of English designs in favour of foreign ones was now totally reversed, English designs being most in demand. In ascribing this wholesome result mainly to the efforts of our Schools of Art, he gave, amongst other evidences, an impressive instance within his own experience of an Art master (who happily was present to hear Sir Thomas's praise) having through the instruction given in his school revived a decayed and almost lost British industry. M. Solon, whose achievements are known wherever Art is vital in the world, and have received pre-eminent marks of distinction in the great international exhibitions, and whose writings are a rich source of reference in the museums and libraries of Europe, gave a vivid picture of the aggressively frightful state of British decoration at the time when, nearly thirty years ago, he came to settle in England. Its appalling impression upon him as a stranger was forcibly conveyed, and he contrasted the advanced condition of Decorative Art now with what he saw when first arriving upon our shores. He showed clearly that in Industrial Art immense strides are being made, so much so that Continental nations are distanced in the race. He emphatically, and from long-continued personal observation, put down the chief cause of this immense progress to the steady, undaunted, and systematic work of our British Schools of Art, and spoke in the highest terms of eulogy regarding their teachers and operations. Mr. Shannon, again, is a living proof of the sound instruction in another branch given under the department, he having had his own training in the central school at South Kensington."

"I HAVE been impelled to write this letter," Mr. Cartlidge continues, "feeling that the importance of the work done by our Art Schools is not as widely known as it might be. This work is well watched and closely examined by our Continental competitors, and in this connection it is interesting to know that Count Hofrath von Scala, director of the Museum of Industrial Art in Vienna, who recently visited the exhibition of national competition works, having also seen that of last year, stated that, in the opinion of most people in Germany, the progress made during the last few years by the Art Schools of Great Britain, especially in the practice of designing for manufacturers and for objects of Decorative Art, was most remarkable; and that no country in Europe had a system which was showing such excellent results. All this evidences how the modern trend towards the best in Art has been well fed and sustained, and, should nothing occur to hamper, restrain, or stifle the vigorous development now so distinctly to be seen, continued advancement must eventually place the nationally profitable labours of the Department and its schools beyond the reach of hostile criticism. In this world few things are perfect, and, just as faults have been eliminated in the past, as they arise they will no doubt be removed in the future, with due care that the life of the departmental tree with its many branches is not risked by pruning at the beginning of the season of fruition, transplanting into an unsuitable soil, or in any way repressing its natural conditions of growth. Moreover, it would be a happy state of things if in this sixtieth year of Her Gracious Majesty's reign the system of national Art education

which was practically initiated by the late Prince Consort should at last receive that full meed of appreciation from the public of our nation which it has well earned and richly deserves."

BRITISH artists have of late been gaining an unusual amount of recognition in Continental exhibitions. At Dresden a first-class medal has been awarded to Mr. William Strang for a picture of "Women Bathing"; and the German Government has purchased a case of portrait medals by M. Legros and a relief by Mr. Frampton. From this same Exhibition the Queen of Saxony has bought the terra-cotta group, "The First Reflection," by Mr. Alfred Drury, who has also gained a second-class medal at Brussels for his bronze "Circe." At Munich, where British art is very well represented, not only has a picture by Mr. Brangwyn been purchased by the Government, but first-class gold medals have been awarded to Sir Edward Burne-Jones for his "St. George and the Dragon" series, to Mr. C. H. Shannon for his picture, "The Wounded Amazon," and to Mr. J. M. Swan for his drawings of animals. All this implies an increase in the Continental appreciation of our national school.

It is said that Mr. Temple, the director of the Guildhall Art Gallery, has commenced to make arrangements for the show which is to be held there next year. This Exhibition is to illustrate French art of the eighteenth and nineteenth centuries, and it should prove to be one of the most important which has, as yet, been held in the City. If it is carried out with the same completeness that has distinguished its predecessors, it will afford a most valuable insight into the progress and development of the modern French School, and can hardly fail to secure very wide popularity. At present the Guildhall Galleries are being re-hung with the permanent collection.

THE Department of Science and Art of the Committee of Council on Education, London, has issued the following list of candidates to whom Royal Exhibitions (Art) and Local Scholarships (Art) have just been awarded: C. A. Palmer, Art student, Croydon; R. Osborne, Art student, South Kensington, R.C.A.; T. C. Bell, Art student, Edinburgh; C. J. Pibworth, Art student, Bristol, Queen's Road; J. T. Friedenson, Art student, Leeds; Mary Caldwell, Art student, Canterbury; N. Heard, Art student, Hull; A. S. Ryland, Art student, Cheltenham; T. Siminon, Art student, Bristol, Queen's Road; and L. T. Taylor, Art student, York, St. Leonard's; each take a Royal Exhibition. Marion E. Broadhead, Art student, Macclesfield; B. Blemens, Art student Holloway, Camden; H. Slinger, Art pupil teacher, Bradford Technical College; C. G. Lowther, sign writer and decorator, Hull; Gertrude Lydia Mary Syme, Art pupil teacher, Watford; W. G. Simmonds, Art student, South Kensington, R.C.A.; H. J. Lintott, Art student, Brighton; R. F. Wells, Art student, South Kensington, R.C.A.; J. F. Pettinger, Art student, York, St. Leonard's; R. H. Smith, Art student, Leeds; Hilda M. Giraud, Art student, Brighton; S. March, carver, Hull; J. M. Aiken, monumental draughtsman, Gray, Aberdeen; W. Taylor, tapestry weaver, Putney; J. E. Sutcliffe, lithographic artist, South Kensington; Leta Rosina Roff, Art student, North London; J. A. Hancox, Art student, Leeds; E. W. Cotton, Art student, Municipal, Birmingham; T. C. Dugdale, Art student, Cavendish Street, Colchester; and Ethel Beatrice May, Art student, Birmingham, each take a Local Scholarship. The Royal Exhibition is tenable for three years, and entitles the holder to free admission to the Royal College of Art at South Kensington or the Metropolitan School of Art, Dublin, for the session of about forty-two weeks each year, and during that time to a maintenance allowance of 25s. a week and third-class railway fare for one journey to and fro, each session, between the home of the scholar and London or Dublin. The Royal Exhibitions are held on the condition that the exhibitor regularly attends the course of instruction laid down for him, complies with the rules laid

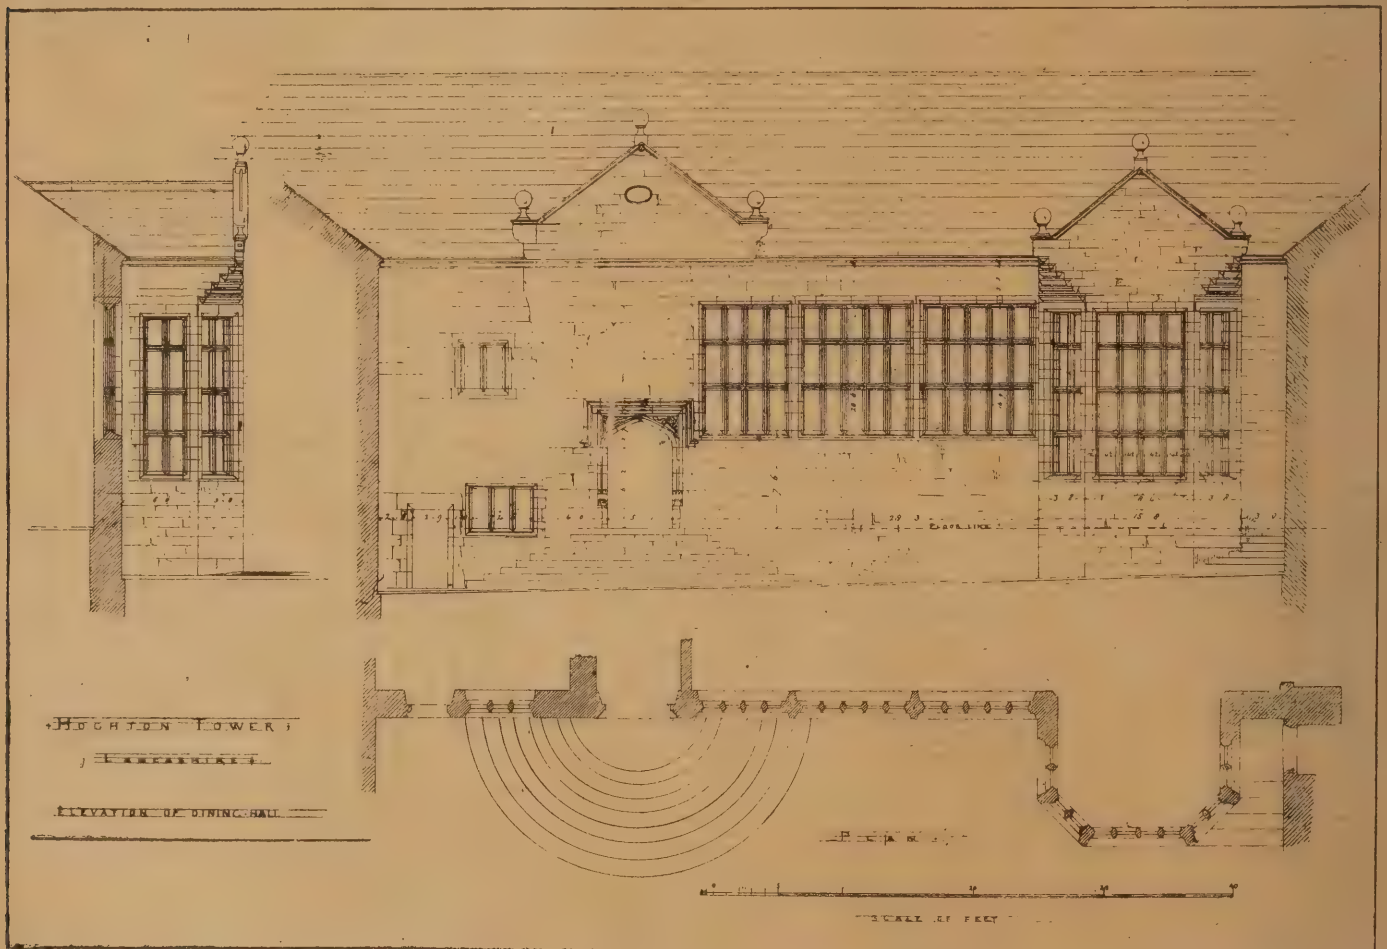

down for his guidance, and makes satisfactory progress. The allowance may be withheld or reduced in the case of a student who fails to attend the Royal College of Art or the Metropolitan School of Art at the prescribed time. A Local Scholarship is tenable for three years, with a maintenance allowance of £20 a year, at any School of Art under the Department which is open at least three days and five nights a week, and which will remit the fees for instruction of the holder.

MEESRS. T. B. SANDERSON AND SON, of Newcastle, write: "With reference to the proposed alterations to the Guildhall Buildings, may we suggest that before the Committee of the Newcastle Exchange pledge themselves to meet the necessary expenditure, it would be advisable for them to inspect the plans of a building which it is proposed to erect in Collingwood Street. If the members of the Exchange care to have premises in this very central position, within four minutes' walk of

the subject of Church Row, Hampstead, will you allow me to add a few words to what they say on the subject, and inform the public what are the schemes which are actually in existence for rebuilding and the steps which are being taken, under the National Trust, to preserve the street in question? That Church Row should be threatened at all is but one more example of the evil men do bring after them. The late Metropolitan Board of Works appears, before its decease, to have carried out some improvements, or alterations, in Hampstead, the result of which can be seen in the new buildings in the street into which Church Row debouches—notably the block on the right-hand side as you enter the Row opposite the Church. Perhaps but for this opening up Church Row might still have remained in seclusion, and not have attracted the attention of the speculating builder. The site, however, of the 'fine, old, well-set-back house' at the right of the Row as you enter opposite the Church, with its cottages and

small informal meeting of those interested in the preservation of Church Row will be held early next week, at which I hope Mr. Ashton and Mr. Woodward will be present, and after that I trust it will be possible to issue a definite practical proposal."

WHEN the Prince of Wales, a few weeks ago, opened the National Gallery of British Art, or the Tate Gallery, the building was not completed. Since then the workmen have been very busy, and last week the public were admitted for the first time to the magnificent structure which occupies the site of the old Millbank Prison. Nearly 3000 persons passed the turnstiles on the opening day. It was noteworthy that the exterior of the gallery, ornamented as it is with some fine specimens of the modern sculptor's art, was closely examined by numbers of the visitors. The surroundings of the place are as yet in a most chaotic condition. In front the works in connection with the temporary bridge which the

WITH THE A.A. IN LANCASHIRE. HOUGHTON TOWER. MEASURED AND DRAWN BY W. A. WADDINGTON FOR THE JOHN O'GAUNT SKETCH BOOK.

the Quayside, two minutes from the Central Station, and just opposite the General Post Office, in connection with which direct communication could be established, the owner is prepared to provide an Exchange 144ft. by 40ft. by 26ft. in height, lighted by dome ceiling lights, news room, smoking and luncheon rooms, together with all the other usual accessories and conveniences, on a scale thoroughly in keeping with the requirements of the city and district. The whole of this accommodation, we may add, would be provided on the ground floor. The contiguity of the proposed Exchange to the large block of new offices about to be erected in Collingwood Street would appear to further add to the feasibility of the scheme."

MR. AMBROSE M. POYNTER, Secretary to the National Trust for Places of Historic Interest or Natural Beauty, in a letter to the Times says, "As I see that Mr. Ashton and Mr. Woodward have addressed letters to you on

garden, it is now proposed to clear and build over, this being done, as Mr. Woodward says, by the freeholder. The houses on either side of the other end next the churchyard have each a strip of land next them, and in the case of each of these it is the ambition of a speculating builder—in one instance, I believe, of the builder of an incredibly hideous block of flats which, just finished, now desolates the upper end of Frognaal—to acquire the house and land and erect a block of buildings over the site thus obtained. I am happy to believe that in these two last cases there are obstacles which will most likely make it impossible for the schemes to be carried out. As regards the remaining house, the National Trust purposes to act in the manner which Mr. Woodward suggests and, if possible, acquire the property in question. A substantial sum has already been offered us for the purpose by an inhabitant of Hampstead, and I trust that when the details of the scheme can be made public others will come forward as generously. A

County Council is building across the Thames are carried almost up to the doors, and on the other three sides the weed-grown rubbish heaps are anything but grateful to the eye. Once inside, however, the spectator quickly forgets the environments in contemplating the magnificent collection of the works of British artists which grace the walls. The paintings purchased under the Chantry bequest fill two apartments. There are eighteen specimens from the famous Watts Collection, and ninety-six of the best examples of the work of the British school in the past forty years have been transferred from the National Gallery. The whole forms an admirable exhibition, and one well worthy the inspection of the hosts of critics, artists, and others who flocked to Millbank on the opening day.

"Referring to my letter on the danger of fire at the South Kensington Museum," writes Mr. M. H. Spielmann, "I may point out as a

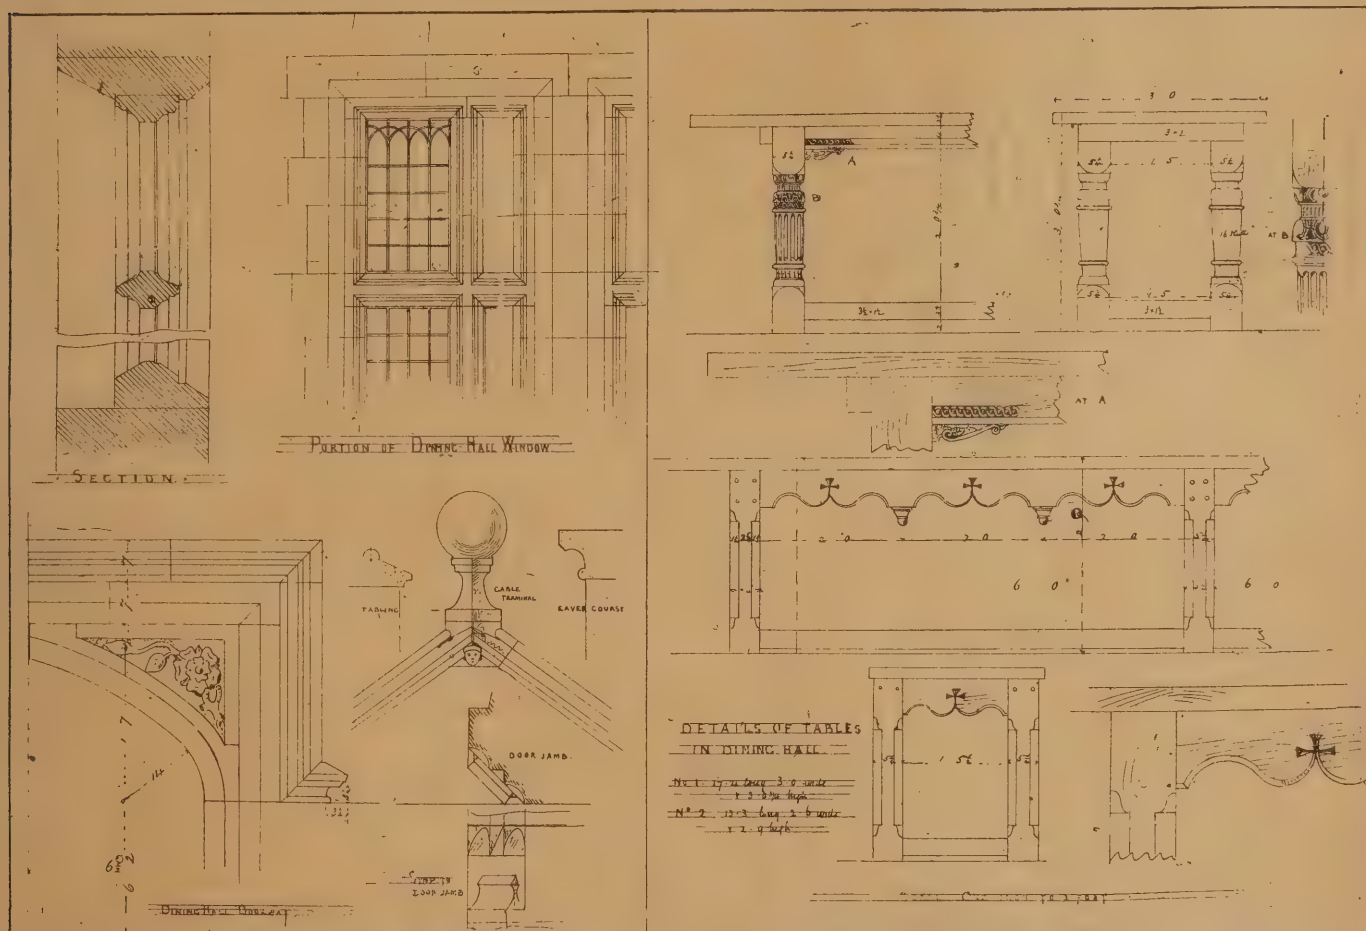

matter of interest that I am informed, in consequence of my exposure of the dangerous character of the structure known as the Imperial Institute Concert Hall, application was made to the County Council surveyor (Mr. Blashill) to make an examination of the building, and that his condemnation of it has been sweeping and emphatic. The building, I would remind you, like the temporary building of the Royal College of Music, is in immediate contact with the walls of the Oriental ceramic courts."

A RESPONSIBLE and an eminently respectable journal—to wit, the *Spectator*—has had the hardihood to allow sentiments to appear in its pages reflecting upon the beauty of Birmingham. The writer, in speaking of the "Tidiness of Rural England," ventures to contrast the clear country with the dark and dreary streets of the Midland metropolis. He even compares Birmingham with Liège. True, the contrast between Birmingham on a rainy day and Liège under bright sunlight is hardly a fair comparison; but it has aroused the ire

room at University College, London, where are exhibited on shelves and tables the recent finds from the ancient city of Oxyrhynchus (Behnesa), about 140 miles south of Cairo, on the edge of the Lybian Desert. We are indebted to the researches of Professor F. Petrie and the learning of P. B. Grenfell and A. S. Hunt, of Queen's College, Oxford, for this exhibition. "It is heart-rending," said the curator, who was present at some of the excavations, "to think that every year thousands of mule loads of precious relics—amongst them papyri, whole archives of first, second, and third century Greek and Roman Christian literature—are simply being carted off as rubbish, and used as manure. If instead of £2000 now subscribed by England and America the civilised world would give £50,000 a year to the work, and give it now, what might not be recovered? But in fifty years, when probably the money will be forthcoming over and over again, it will be too late, and we shall have to pay in excess for small returns—any fragments that can be gathered up—as for the

reason it is proposed to ask the vestry of Hendon and the Hendon District Council to contribute, should the terms of purchase be favourable.

A VERY great alteration in the immediate neighbourhood of the Mint will shortly be carried out. Under the County Council's General Powers Act, 1897, a new road is to be constructed from Whitechapel to the Tower Bridge. The one drawback to the usefulness of this bridge has been the difficulty of approach from the East End. This will be entirely altered by the proposed improvement. The road will be carried in a straight line from Little Tower Hill to Royal Mint Street, and its construction will involve the destruction of a large number of poor-class dwellings, many of them of wood, which ought to have been condemned years ago. The passing of the road under the railway will necessitate the removal of three brick arches, whose place will be taken by an iron girder bridge. It was in one of these arches that

WITH THE A.A. IN LANCASHIRE. HOGHTON TOWER. MEASURED AND DRAWN BY W. A. WADDINGTON FOR THE JOHN O'GAUNT SKETCH BOOK.

of the Birmingham Daily Post—"the caricature is utterly ignorant and mendacious." Is not the centre of the town remarkable for the openness and picturesqueness in the character of the thoroughfares and principal buildings? The chief streets rank among the finest in England, and so on the Post argues. Still Birmingham is to blame for placing two of its finest buildings—the Victoria Law Courts and the new hospital—far away from the centre of the city, and it is even now about to pull down one of its finest old Churches in the most prominent position amongst its great buildings, to make way for spick and span modern shops or business premises. There is room for criticism, but much has been done, especially in Birmingham, to make our huge mammoth towns more shapely and worthy of their true importance in the march of progress.

ANTIQUARIES and lovers of history may well gnash their teeth with rage at the apathy of the civilised world as they walk through the

Sibylline Books." Of course, it is not only whole archives of ancient literature that may be lying there, to be carted away for manure, but other priceless relics. Statuettes in wood, one exquisitely finished and perfect; a nude negress in ebony, 1400 B.C.; copper vessels and perfect jars of Oriental alabaster, 4000 and 5000 B.C.; necklaces and strings of jewels in superb variety and patterns, daily filched and scattered incontinently!

THE Parks Committee of the London County Council is negotiating with the owners of Golder's Hill Estate with a view to purchase on behalf of the public some twelve acres of the land as an extension of Hampstead Heath. The ground adjoins the West Heath, and is beautifully laid out, a stream, which is one of the sources of the Brent, here perfectly unpolluted, running through it. A small portion lies in the parish of Hampstead, but the larger part is in Hendon, and therefore outside the boundary of the county of London. For this

one of the latest of the Whitechapel murders took place. The improvement is worth the attention of municipal bodies outside London from the fact that four railway companies who have extensive goods yards in the locality are brought by the Act under the Betterment Clause.

TANFIELD HALL, situated on the Water of Leith at Canon Mills, has been demolished. For some years it has been used as a bonded store; but the space having become too small, it has to give place to new and extensive stores. On the 18th of May, 1843, when the 300 ministers left the General Assembly of the Auld Kirk in St Andrew's Church, they repaired to this hall amid a whirl of enthusiasm. Here the Free Church was constituted, and its first Assembly held, over which Dr. Chalmers presided as first Moderator. The famous picture, "Signing the Deed of Demission," gives a very accurate idea of the construction and dimensions of the hall in those days. In 1847 the

proud distinction, heading the list of the eight principal Schools of Art with thirty-four medals and fifty-seven total prizes as against twenty-three medals and fifty-six total prizes won by the students at the next best school on the list—Birmingham. Glasgow is justly proud of its School of Art, which, in the coming session, aspires, if we may judge from the recently-issued prospectus, at eclipsing its past record of useful work in Art tuition. A local prize scheme has been adopted with a view to assisting such a happy result. The Governors of the School grant twelve free studentships, tenable for the ensuing session to students of the evening classes, to be awarded upon the result of the session's work of each individual student. In addition, special prizes are offered to encourage students of both the day and evening classes, and will cover all the subjects prominent in the School's curriculum. Architecture, it may be noted, receives due attention at the Glasgow School; the Governors seem to possess a true sense of its importance as a branch of

Surveying and Sanitary SUPPLEMENT.

AUGUST 25TH, 1897.

TUNNEL SCHEMES.

THE recent opening of the Blackwall Tunnel may give some interest to a brief account of some other great tunnel schemes, some of which we may expect to see carried out before many years have passed. The Bridges Committee of the London County Council has just obtained an Act for a tunnel for foot-passengers between Millwall and Greenwich, costing £96,000, and another has been proposed between North and South Woolwich. The scheme for an English Channel Tunnel is too well known to require further mention. Of late the project for a tunnel under the North Channel, to connect Ireland with Scotland, has received considerable attention, and is likely to receive more, inasmuch as the distance is about the same as between Dover and Calais, while there are not the same objections from military quarters as there were in the case of the tunnel to France. Probably the next great tunnel to be completed will be that under the Simplon, to connect Switzerland with Italy. This tunnel will be fourteen and a half miles long, or five miles longer than the one under the St. Gothard, which is the longest railway tunnel in the world. The negotiations between the Swiss and Italian Governments are now practically complete, and work is expected to commence almost immediately. One of the great difficulties encountered in these Alpine tunnels is the heat arising from the great depth below the surface. This has to be overcome by pumping in fresh air, which serves at the same time for ventilation. The Hudson River Tunnel at New York was abandoned before completion owing to the difficulty of raising more capital, but some people in New York have offered to supply half the money necessary to finish it. It will probably, therefore, be completed before long, as it would be of immense importance to the city, and would carry the traffic to and from New Jersey in connection with the elevated railway.

A STRANGE TUNNEL AT CREWE.

Perhaps one of the strangest tunnels of all is that at present being constructed under Crewe Station, which will be left free for passenger traffic, only goods traffic being conducted through the tunnel. The scheme for making a tunnel under the river Medina to connect East and West Cowes was one in which the late Prince Henry of Battenberg took great interest. A company was formed to carry out the project more than three years ago, but operations have not yet been commenced. The difficulties of the Panama Canal tempted a Mr. C. F. Cole, of Chicago, to suggest that some of them might be obviated by a tunnel through which ships could pass if their masts were specially constructed, either telescopically or by being hinged. A ship entering would pass between a pair of cranes, the yards having been first placed in a vertical position by the crew, and the masts would be lowered, to be raised again by a similar process on emerging. Coming back again to the old world, we find that a scheme for com-

munication through the mountain barriers that separate France from Spain has made substantial progress. The project consists in the establishment of two international lines of railway—one from St. Giron to Lerida, and the other from Claron to a point on the line from Saragossa to Barcelona. Each tunnel would be about five miles long, and would take ten years to pierce.

ANOTHER ELEVEN MILES IN LENGTH.

Copenhagen, owing to its isolated position on the island of Zealand, is cut off not only from the rest of Denmark, but from the rest of Europe, by the Great Belt between Zealand and Funen, and the Little Belt between Funen and the mainland. In order to overcome these natural barriers, a scheme for through land communication between Copenhagen and the rest of Europe was brought forward about four years ago. As regards the little belt, there would be no difficulty in constructing a cantilever bridge across it. But the Great Belt would be too wide for a bridge, notwithstanding the opportune existence of an island in mid-channel. Danish engineers, therefore, recommend for this part of the scheme a tunnel, which would be eleven miles in length. The bridge would cost £700,000, and the tunnel not far from a million and a quarter, making a total of nearly two millions. There is a third passage between the North Sea and the Baltic, namely, the Sound, which lies between Zealand and Sweden. If this channel were also tunnelled, there would be direct through communication between Norway, Sweden, Denmark, and the rest of Europe. Some years ago a proposal was presented to the Governments of Denmark and Sweden in this connection. The plan, which was drawn up by a French engineer, M. Alex. Rothe, was for a tunnel passing under an island in the middle of the Sound. It was to commence a little east of Copenhagen, and to terminate a little south of Malmo. The submarine portion would be six miles long. The total cost was put at a million and a quarter. The scheme was received with enthusiasm in the three Scandinavian countries, but the matter has temporarily dropped. Prince Edward Island, in the Gulf of St. Lawrence, is separated from the mainland of Canada by the Northumberland Straits, which are blocked in winter by fields of Arctic ice. When the island entered the Dominion, part of the agreement was that communication should be kept up with the mainland all the year round. As it has been found impossible to do this by steamer, the Government of the island has approved plans for the construction of a tunnel tube $6\frac{1}{2}$ miles in length, which is intended to lie on a plateau at the bottom of the Straits. The depth is from 36ft. to 80ft., and the cost is put at one million sterling.

A TUNNEL BETWEEN ITALY AND SICILY.

The length of a submarine tunnel between Italy and Sicily would be 43,296ft., and the greatest depth of water 360ft. Its direction from St. Agata to Punta del Pizzo is almost due north-west and south-east. According to geologists, the bottom of the Straits of Messina consists of crystalline rock (granite

gneiss and mica schists). This scheme, though brought forward in 1882, has not yet been proceeded with. Besides the Mont Cenis, the St. Gothard, and the Arlberg tunnels, which have already been pierced, and the Simplon tunnel, which is about to be commenced, other schemes for piercing the Alps have from time to time been brought forward. The Bavarian press has warmly advocated a scheme for tunnelling under the Lackmann Pass. A Zurich professor has given much attention to a project for tunnelling Mont Blanc, from Courmayeur to Pre St. Didier. The tunnel would have to be driven through a formation of anhydrous gypsum. The temperature, which depends not only on the vertical depth but on the configuration of the mountain, would be from 86 deg. to 122 deg. F., as against 84 deg. in the Mont Cenis and 87 deg. in the St. Gothard tunnels. Preliminary surveys were also at one time made for a tunnel under the Great St. Bernard. Coming nearer home again, we may mention the project for a tunnel under the Forth, which was entertained even as late as 1891, but which, so long as the Forth Bridge stands, is hardly likely ever to be revived. Two other tunnels, which are almost certain to be made some day, are worth mentioning. One would connect the railway north and south of the Humber, and give the southern lines a terminus at Hull. Parliamentary sanction was at one time obtained for carrying out this scheme. The other would connect the Isle of Wight railways with the South Western. It is not improbable that some of the above tunnels will be constructed before long. Tunnel construction has recently made great advances; improved rock drills, nitro-glycerine, and other explosives facilitate operations in rock, and the use of air pressure enables tunnels to be constructed in soft and water-bearing strata at shallow depths.

ABERDEEN'S SEWAGE SCHEME.

THE Sewerage Committee of the Aberdeen Corporation has had under consideration a very large scheme for the improvement and extension of the sewerage system in the city. The Committee reports that it has considered the tenders for the outfall portion of the scheme, and accepted the lowest contract for the work, at the price of £8072 4s. 3d., Mr. George Pirie, the contractor for the Brechin and Edzell Railway, being the successful offerer. The sewer is intended to discharge an enormous mass of sewage material into the Dee near Victoria Bridge, and be a menace not merely to the development of what is rapidly becoming one of the most favourite promenade and recreative centres about the city, but to the public health of the district; for the sewer about to be constructed is of a very large size, much beyond the ordinary—as, indeed, was the studied intention, seeing it is to form the outfall for the sewerage system of the southern and south-western side of the city. The portion covered by the contract runs up as

far only as the foot of Portland Street, where a collecting chamber is to be situated as the junction of the sewers from various directions. From this collecting chamber it will run for a distance of 200 yards as a 4ft. sewer; it then becomes enlarged, running towards the river side, and for 200 yards further it will be of 5ft. diameter. Enlarging as it proceeds, it becomes, as it passes down the Riverside Road to Victoria Bridge, for a distance of 120 yards, a sewer of 5½ft. in diameter; near the Victoria Bridge it enlarges still more, and runs for over 100 yards as a 6ft. sewer; and, finally, for a distance of about 80 yards, it runs as a sewer of 6½ft. in diameter, and discharges its torrent at an outfall 9ft. wide by 4ft. deep into the waters of the Dee 200 yards below the Victoria Bridge. The sewer is to be of brick and cement, and circular in shape until the outfall is reached. The outfall will be of elliptical form, and constructed of granite and cement; and for its construction a cofferdam of considerable depth will be sunk in the river. As already indicated, the sewer is intended to form the outfall for the sewage collected at the junction chamber near the foot of Portland Street. It is expected to serve not only the Ferryhill district, but the Holburn, Broomhill, and Ashley localities, already thickly populated, and to which new streets of houses are being added every year. It will therefore convey to the river a very considerable quantity of sewage from the first, but ultimately, if the extension of the city proceeds as it has been doing of late, and for which provision is being made in the very magnitude of the sewer itself, it will pour into the river so much noxious matter as may well cause uneasiness to the residents in the neighbourhood and the public generally. It is the prospect of this that has caused many whose interests are directly threatened to turn their attention to the proposed scheme, and now that its character has become apparent,

MANY OBJECTIONS

are being urged against it which are not to be lightly regarded. In the first place, it is pointed out that constant pouring of a flood of sewage into the Dee at that place will operate very disastrously against the amenities of the neighbourhood. There is an outfall sewer at the riverside, which has been an eyesore as well as a source of public danger for the last twelve years. But this outfall is but 18in. in diameter, whereas the proposed new outfall, as before stated, is to be 9ft. wide by 4ft. deep, and although the sewage matter is to be discharged below the level of low water, the danger and objectionable character of the proposal is held to be thereby not a whit reduced. Indeed, it is feared that, at certain times, the beautiful riverside esplanade, which has been made and ornamented at very considerable cost, may not be useable. Aberdonians are rather proud of the extension of the city which is proceeding, on the south side of the river, but it is urged that the streets directly overlooking the Dee, from the south side, are hardly likely to continue popular if the river immediately opposite these dwellings is, at every succeeding tide, to be charged with the surging sewage from a third part of the city. In the lower portion of the ground, fronting the river on the south side, cottages have begun to make their appearance, but it is feared that if this large outfall at this place is insisted on the development of building in that connection will receive an effectual check. The objection which applies to the sewerage from the residents on the south side of the river applies with all but equal force to those on the north side, in the numerous works on the Reclaimed Land, and to the dwellings that overlook the river from the higher parts of the Ferryhill district. The body whose interests are most directly threatened in this matter, and whose attention is now being directed to the new scheme, is the Harbour Board, whose approval is necessary for the new scheme before it can be proceeded with.

THE Pudsey Urban District Council has appointed Mr. Joseph Jones, of Eccleshill, Surveyor to the Council, at a salary of £140 per annum.

THE NIDD VALLEY WATERWORKS.

THE members of the Bradford Town Council recently visited the Gouthwaite compensation reservoir in connection with the new Nidd Valley waterworks. The party drove to Wath, and then walked to the huge quarry adjacent to the reservoir. The discovery that good stone existed at that spot was an extremely fortunate one for the Corporation, since a line of rails has been laid from the quarry to the reservoir itself, and the necessary stone, in huge blocks weighing from three to ten tons each, is conveyed by gravitation on cars down the line of rails to where it is required. The huge size of the quarry impressed the members of the Council very much, especially when they realised that practically all the stone taken from that great chasm has already been used in the construction of the dam of the reservoir. The party then walked along the tramway to the embankment of the reservoir. The general features of this part of the Nidd scheme have frequently been described. Roughly, they may be said to consist of throwing

A HUGE BARRIER OF SOLID MASONRY

across the Nidd Valley, and thus damming up the river, and converting that part of the valley above the structure into a lake, two and a half miles long and half a mile wide. The dam itself has, of course, to be of immense strength, in order to withstand the enormous pressure of the water, and its maximum depth is 110ft. and its width 74ft. The mere task of erecting such a colossal structure is obviously no light one, but the engineers have had other difficulties to face. The river Nidd, which flows down the valley, is in times of flood very impetuous, and before any work at all could be done the stream had to be diverted. When the Bradford Town Council visited the works last year the Nidd was flowing in an artificial channel, and that portion of the dam which stretches across the ordinary course of the stream was being constructed. Since then the river has been turned back into its old channel; but in doing so one precaution was taken which shows how thoroughly the Waterworks Committee and its engineers watch every little point connected with the work. That portion of the dam stretching across the bed of the river has been almost completed, and two large culverts, the openings of which are controlled by valves, have been left in the dam, in order to allow the river to flow through. But the engineers realised that if the river came down in flood these culverts might not be sufficient to carry away all the water. The inevitable result of that would have been that the foundations of the remainder of the dam, which are being sunk to a great depth below the surface, would have been flooded, and very great expense would thereby have been occasioned. To avoid this the engineers have left

A BREACH IN THE DAM

which can be easily filled up, but which is more than sufficient to allow all the water of the river to pass through it, even in rainy weather. With this exception the dam is at one end practically completed. The remainder has been erected to various heights, tapering down to the foundations at the west end. To the average ratepayer the work would seem to have progressed with painful slowness, and at first it is difficult to realise that about 300 men are constantly at work there. But the size of the undertaking grows on the visitor as he descends into the huge trench, 100ft. deep, and realises how many millions of cubic feet of earth have been excavated, and how many millions of tons of stone and concrete have already been swallowed up in the construction of that huge mass of masonry. No one could inspect the work without realising the thoroughness with which it was being done, and the care which was being taken to prevent any recurrence of such disasters as the one at Holmfirth forty-five years ago. The fields above the dam presented a refreshing appearance, and Gouthwaite Hall seemed as interesting as ever. In two or three years' time, when the reservoir is completed, these will all

be covered with water, but probably the lake thus formed will add to, rather than detract from, the natural attractions of that portion of the Nidd Valley. The party afterwards drove to Ramskill. Some of the houses have been entirely renovated, and paint has been used rather freely—changes not wholly unconnected, perhaps, with the advent of so many workmen into that district. When the reservoir is completed the water will come almost to Ramskill Church. The present road between Gouthwaite and Ramskill will be submerged, and a new road, higher up the hillside, has been constructed between those places. The Gouthwaite Reservoir is being constructed to compensate the users of water lower down the valley. Above Gouthwaite the Corporation has power to construct three service reservoirs to

SUPPLY WATER TO BRADFORD,

but these will probably not be made for many years yet. A conduit is now being constructed from the Nidd Valley to Gouthwaite. By using the streams which this conduit intercepts, and by erecting a small dam at Woodale, a supply of about four million gallons a day can be obtained. The construction of this conduit is now very far advanced. Eighteen bridges have been practically completed, and of the 25,000yds. of pipe-laying over 22,000yds. have been finished. The three tunnels on the line of the conduit—Ram Stang Tunnel (2486yds. long), Burn Tunnel (1840yds.), and Greenhow Tunnel (6204yds.)—have been difficult works, but Burn Tunnel is now practically completed. Of Ram Stang Tunnel only between four and five hundred yards are yet to construct, and Greenhow Tunnel has been pierced for three-fifths of the distance. Of the 20,000 lineal yards of cut and cover work less than 4000yds. remain to be done. Practically eight or nine tenths of the work connected with the present instalment of the scheme, which would cost £800,000, has been completed.

Surveying and Sanitary Notes.

THE largest water-storage reservoir in the world is now in process of construction by the City of Boston, U.S.A., its intended capacity reaching the enormous figure of 65 billions of gallons, or enough to supply that city for 3½ years, and four times as much as the capacity of all its existing waterworks reservoirs. The vast capacity named is twice that of the new Croton reservoir of New York, thrice that of the six reservoirs of Birmingham, thirty times that of the Cochituate of Boston, and will hold more water than Boston's inner harbour. The dam is located at Clinton, and the vast volume of water, covering over 4000 acres, will be entrapped and retained by a dam some 1250ft. long, 127ft. high above the ground, and some 158ft. high above its rock foundation. No such immense engineering work has ever before been undertaken in New England.

MR. ROBERT BICKNELL COHEN resumed at the Croydon Town Hall his enquiry on behalf of the Local Government Board into the application of the Corporation for sanction to borrow the sum of £32,000 for the erection of new waterworks at Waddon. Mr. Bray, for the opposition, argued that the time had not arrived for the proposed extension, the corporation's reserve supply of water at Addington being sufficient to carry them on for at least six or eight years, and therefore the expenditure of this money was quite unnecessary. He also contended that the water derived from the well recently bored at Waddon would be polluted. Mr. Baldwin Latham, of Victoria Street, Westminster, said he had tested the temperature of the water in the proposed new well, and found it to be the same at a depth of 50ft. and 250ft. respectively, namely, 51deg. It ought to have been nearly 56deg. The inference he drew from that was that there was a slight downward

movement in the chalk. It was, in his opinion, polluted water, and would be particularly dangerous in the low-water period. The existing wells in Surrey Street were dangerous at times.

At the quarterly meeting of Ipswich Town Council, the Mayor (Mr. F. T. Cobbold) presiding, the Paving and Lighting and General Street Cleansing Committee reported: 1. That St. Edmund's Road, from Henley Road to Warrington Road, was a highway not repairable by the inhabitants at large, and they recommend the Council to order notices to be given requiring the owners or occupiers in the said street to sewer, level, pave, metal, flag, channel, and make good the same, and provide proper means for lighting according to the plan and sections made under the direction of the surveyor, and submitted for approval. 2. As to purchase of blocks for wood-paving, the Committee had invited tenders for the supply of 250,000 as ordered by

the Council, and that of Messrs. Jewson and Sons, of Norwich, being the lowest, had been accepted, viz.: For the first 50,000 £5 5s. per 1000, for the second 50,000 £5 7s. 6d. per 1000, and for 150,000 £5 10s. per 1000.

The Sewerage Committee reported to the Aberdeen Town Council last week that, acting under powers from the Council, it had accepted the offer of Mr. George Pirie, contractor, to construct a new main outfall sewer into the Dee at a cost of £8072. The Town Clerk, Mr. Gordon, read a letter from Messrs. Wilsone and Duffus, advocates, on behalf of the Dee District Fishery Board, objecting to the proposal on the ground that it would have an injurious effect on the salmon fishings in the river. Mr. Cooper said he objected entirely to an outfall sewer entering the river near Victoria Bridge. It was utterly wrong to go on with the scheme. Treasurer Bisset stated that although the size of the sewer would be much increased, the volume of sewage would

not be materially increased for a considerable time. The object of enlarging it was to take away overflow water, which was continually causing flooding in the Ferryhill district. The report of the Committee was adopted.

The Birstall District Council and its Surveyor have often been at variance. Mr. Fred Clark, the official in question, has just tendered a month's notice to leave, and given as his reason for so doing "persecution that he had been subjected to." He stated that since coming to Birstall a part of the Council had been the Surveyor's enemy, and he had been the target for them to shoot at. As to his abilities, which had been so much questioned, he referred certain Councillors to his previous employers, and told them that he held a certificate of the Society of Engineers. It was contended by some that the Surveyor had been most shamefully and abominably used, and by others that he had brought all the trouble upon himself.—The resignation was accepted.

"	London, S.E.—Two Libraries	£25 each	Lewisham Vestry.

IS THE PARTHENON DOOMED?

THE Parthenon is doomed. These words are calculated to bring sorrow to the heart of every lover of Greece and Grecian culture. Perhaps many, who have only seen the stately pile from below, will be inclined to doubt the statement thus brusquely made. Indeed, when one sees the ruin from a distance, or looks up at it from among the pillars of the western façade, it seems so strongly built, so secure, that the visitor has no thought of decay and ruin, but leaves the place under the impression that the Parthenon will continue to defy time for countless ages. But the fact is, according to a correspondent of the Times, that ever since the earthquakes of several years ago the immediate ruin of the Parthenon has been a foregone conclusion in case another earthquake should occur before certain repairs shall have been completed. As I write, in the spring of 1897, the whole

WESTERN FACADE IS DISFIGURED

by an immense scaffolding, built in the strongest possible way from enormous beams that were brought all the way from America to serve Athens. This mighty scaffolding subserves a twofold purpose; primarily, it enables the Architects to replace certain rotten and broken architrave blocks with fresh blocks; but its important secondary purpose is to serve as a prop to the entire entablature, and prevent the collapse of the building in case of an earthquake. I gained admittance to this scaffolding on two occasions recently. I was thus enabled to examine at close quarters the frieze of the western end, a privilege for which many have longed in vain. It is a privilege, too, that will not be re-offered to anyone when the present scaffolding shall have been removed. From the base of the columns below any study of the frieze is out of the question—first, because, owing to the projecting epistyle, the bottom of the frieze cannot be seen, then because the whole frieze is distorted by a sharp perspective, and the lower-lying parts of the reliefs are hidden by the higher. The scaffolding affords, then, a unique opportunity for the study of certain chapters of Pheidias Art. But, not to dwell upon the frieze longer in this connection, I must say that I was dismayed at what I saw. The inside and interior stones of the entablature are rotten throughout. In many cases these rotten stones were

BROKEN BY THE RECENT EARTHQUAKES

into many pieces, though by the veriest miracle these pieces still cling together. As is well known, the epistyle consists of three huge blocks that stand on their narrow edges side by side and span the intercolumniations. Of these three blocks the outside ones alone are comparatively sound, while the interior and inside blocks are in a most ruinous condition. All of these inside blocks are to be replaced by new ones that are now lying on the ground below ready to be hoisted into position as soon as the mighty derrick that is to lift them on high shall have arrived from Europe. The thought of new epistyle blocks in the Parthenon is shocking to most souls, and yet it is a choice between that and immediate ruin. The new blocks will be coloured with oil and wax in order to rob them of their glaring whiteness and newness. But even more sorrowful is the fact that, though this ruin may be stayed for one or two centuries yet to come, still in the end the Parthenon must collapse unless virtually the whole entablature be replaced by new and sound stones. Am I asked for the reasons for this

RUINOUS CONDITION OF THE PARTHENON?

There are several reasons, several causes, some of which have been in effective operation for many years, though all unsuspected. We have been brought up to believe that the Parthenon was a perfect building erected by master builders, who employed only the best of material in its construction. It occasions a shock to discover that, though this is true in general, yet it is true with certain limiting qualifications, because of which the building

is now threatened with ruin. In point of fact the builders of the Parthenon employed first-class marble only on the outside of the building, only where the eye could see it. In the Pentelic marble there are veins of schist that disfigure and ruin many a fair block. Visitors will remember the many unfluted drums of columns that lie here and there around the temple. These are drums that were rejected of the builders—rejected because they were faulty in some way, often precisely because of this disastrous vein of schist. Indeed, one of the new epistyle blocks has just been rejected by the Committee of Architects because of its faulty character, which was discovered only after the block had been completely hewn, and was ready to be hoisted into position. No doubt that block will remain there for centuries to come, just as

THE REJECTED DRUMS OF COLUMNS

have lain for these decades of centuries. Now, of course, perfectly sound marble was employed in columns, both because they were completely visible and also because they had a great weight to carry. Sound marble was employed also in the outside stones of the entablature and of the cella walls, but the inside stones of the cella walls and the two inside stones of the epistyle were faulty from the start—faulty because of this vein of schist. As long as the building was covered by a roof the faulty character of these stones was of no importance whatever, and, as is well known, the Parthenon was always covered by a roof until its final disruption by the gunpowder explosion two centuries ago. The ruin that now threatens the portion left standing on that fatal occasion began from the moment of the explosion, and it has become more serious with each succeeding year. The roofless condition of the building has made it possible for the rain to penetrate into the schist veins of the faulty stones. At first but slight damage was done to these stones, but the frost of winter and the scorching sun of summer made the evil greater from year to year, until at last the scales fall from our eyes, and we discover that these stones are rotten throughout. The horror was revealed in its full extent by the earthquakes, when a number of these rotten blocks were shivered into many pieces. The fact that these splintered blocks did not fall is due to the soundness of the neighbouring blocks on the outside. But though the ultimate cause of the ruinous condition of the Parthenon was the employment in its construction of poor marble for interior and inside stones, which

TWO CENTURIES OF EXPOSURE

to rain, frost, and heat have made rotten, still other things have conspired with these—namely, fire and cannon balls before the disruption and earthquakes at all periods. The repairs that are to be undertaken now are not to be thoroughgoing, but, in fact, are only temporary makeshifts, though they will, perhaps, preserve the building for a couple of centuries. Many will remember that twenty-five years ago the lintels of the grand doorway of the western end of the Parthenon were discovered to be rotten. In 1872 a supporting arch was built beneath these huge stone lintels. This arch rests upon the slabs of the Byzantine doorway. The present moment offers a good opportunity for replacing the broken lintels with new stone beams. Were this done the arch and the ugly slabs of the Byzantine doorway could be removed, and then the mighty door would stand revealed in all its glory as it was conceived by Iktinos. It is known, too, that some of the stones used in this Byzantine patch-door are inscribed. This fact is one more reason for removing the patchwork, because, to judge by the beauty and great size of the stones, the assumption that they bear valuable inscriptions does not seem to be an empty one. It is to be hoped, too, that the

STAIRWAY TO THE TURKISH MINARET

will be taken down. It has been left there up to the present because it supports rotten architraves; but we demand a purified Parthenon, and surely a few more new epistyle blocks would not disfigure the building one

tithe as much as does this Turkish minaret. A conservative desire to remove only such of the old stones as are hopelessly rotten and broken prevails. This desire can be easily understood, and one's natural instinct is to share it; but, after all, sentiment should give place to common-sense, which clearly calls for repairs more radical than those which are to be made. And here comes in a fear for the frieze, the glorious frieze that fairly palpitates with the genius of Pheidias. When the final collapse of the Parthenon comes the frieze will be gone for ever. This remote danger, however, is not the only one that threatens the frieze; for there it stands exposed, like all the building, to slow but absolutely certain decay and ruin. In the recent earthquakes the head of one of the horsemen was broken off and dashed to pieces on the marble floor below. A similar fate is in store for the entire frieze, for the rotting process is already visible in the reliefs. In short, the reliefs ought to be removed now, so that they might be preserved in the museum for ages after the original entablature has ceased to exist. Dürpfeld did indeed propose to the committee that the frieze be removed to a safer and dryer place and be replaced by a marble copy. But conservatism carried the day. The thought, too, that

THE REMOVAL OF THE FRIEZE

to the museum would seem to justify the spoliation of the shrine by the deeply detested Lord Elgin had much to do with the stand taken by the majority of the committee. The frieze therefore will remain *in situ*, and will perish. There can be no doubt that the Parthenon would hold out for many centuries longer if it were covered by a roof. But it is thought by most men that a roof over the Parthenon would disfigure it absurdly. Of course it would; but then the roof would save the building, and sentiment would give the front seat to sound reasoning—which naturally would never, never do. But I must hasten to add that the care which the Greek Archaeological Society bestows upon all the ruins is worthy of unstinted praise. I first knew Greece twenty-two years ago. The Archaeological Society was making excavations then, to be sure, but the people, though much given to boasting of their ancestors, had little, almost no reverence for things upon which was laid the impress of the genius of those self-same ancestors. The ruins were abused and desecrated in a way that made the breast of the visitor from the West swell with rage and indignation. It is now eleven years since I bade, as I then thought, a final farewell to Greece. During the eleven years that have elapsed since then wonderful progress has been made by the Greeks in the matter of

REVERENT CARE FOR THE ANTIQUITIES.

I am not so sure that this reverence prevails to any great extent among the common people, but they are entitled to the benefit of the doubt. At any rate the management of the Archaeological Society deserves the thanks of all men for their efforts to make it impossible for the *plebs* to insult or mutilate the monuments. The ruins are now behind strong iron bars. For instance, a great iron fence protects the whole country between the Odeion of Herodes Attikos and the Theatre of Dionysos. Another fence protects the Dipylon-Kerameikos region; another one the Areiopagos and the sanctuary of the Eumenides, which, as I well remember, was once the rendezvous of gipsies and unsavoury tramps with their bears, and other unmentionable accessories. But this is changed now, thanks to the Archaeological Society. This change is seen and felt not only in outdoor matters, but the museums themselves are now arranged and managed in a most satisfactory manner. Something like order reigns, and scholars may study without vexation and loss of time. This, however, is not yet true of the epigraphical branch of the museum, for everything there is still in a chaotic condition. I must add, however, that the improvement brought about in this branch within the last decade is most noticeable and praiseworthy, and yet, if one is in search of a special inscription, days may be spent in the

perhaps fruitless endeavour to find it. A detailed catalogue is still a crying need.

DISARMING THE ALARMISTS.

Inquiries made among the best English archaeologists seem to show that the sensational statements regarding the dangers of the Parthenon collapsing are, says the Daily News of the 17th inst., greatly exaggerated. It is true that for some time there have been signs of decay in parts of the famous Athenian temple, certain blocks in the architraves having proved rotten, and others having slightly given way, owing to the shocks of earthquakes. But, as Mr. Penrose, the Architect at St. Paul's Cathedral, pointed out some years ago, the stones are so perfectly jointed that the errors occasioned by any small shifts arising from earthquakes, or from the violence of human agency, can be corrected most satisfactorily. An International Committee of Experts, with Mr. Penrose as the English representative, sat some time ago to consider what repairs were necessary. It decided that a partial restoration was wanted, but that no changes in form or in the kind of material used could be permitted. The Greek authorities, with true Oriental spirit, have shown great leisureliness in carrying out the repairs the committee suggested. First, it was decided that nothing must be done till after the Olympic games were finished. At the end of the games a great mass of scaffolding was erected, and this effort seemed, for the time, to exhaust the strength of the Greeks. Careful observers declare that, at the present rate of progress, it will be at least five years more before the work of restoration is completed. With energy all might be done, and the present unsightly scaffolding cleared away within twelve months. When restored there is every reason to hope that the Parthenon may stand for almost

AS MANY CENTURIES IN THE FUTURE

as it has done in the past. To speak of it as being "doomed" is nothing more than clap-trap. For the present dilatoriness in restoring it neither the depleted state of the Grecian Treasury nor the absorption of the Turko-Greek war are to blame. The work lies in the hands of the Greek Archaeological Society, a rich and powerful body, directed by M. Cavvadias. This society obtains a large income from lotteries, and undoubtedly has done something, within the last eleven or twelve years, to improve the national treatment of the old Hellenic memorials. Only a little time back the Greeks neglected their architectural treasures in a way almost incredible to more cultured nations. Even now there yet remains much to be done. While reasonable care is taken of the monuments around Athens, further inland they are shockingly treated. One of the most valuable, excavated a few years back at great cost, is now used for the lowest purposes. There have for some time been rumours of a movement among Western savants to bring such pressure to bear on M. Cavvadias and his assistants that they shall be compelled to exercise more energy and common-sense in the fulfilment of their trust.

According to the designs of Mr. J. W. Stevens, of New Bridge-street, a factory is in course of erection at Brook Green, Hammer-smith, for the Incandescent Electric Lamp Company.

A STAINED glass window has been put in the north side of the Grantham Parish Church. The four principal panels are devoted to figures of St. Ambrose, St. Jerome, St. Gregory, and St. Augustine; and at the foot of each Saint is depicted one of the chief incidents in his life.

It has been decided to seek a loan of £14,250 from the London County Council for the purpose of laying electric mains, for both public and private supply, in Camden, Archway, and Junction Roads, to the parish boundary; also on both sides of Highgate Hill to the parish boundary. The question of laying electric mains along Essex Road and in the residential district of Highbury is deferred for future consideration.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE British Archaeological Association commenced its annual congress at Conway on Thursday. On the opening day there was a reception by the Mayor and Corporation, and an inaugural address was delivered by the President, Lord Mostyn. A visit was paid to the ancient castle and the town walls, under the guidance of Mr. T. B. Farrington, C.E., the local honorary secretary, and the Parish Church, with Plas Mawr, and the remains of the Cistercian Abbey at Conway, were visited. On Friday, St. Asaph Cathedral was visited, and the famous caves of Rhuddlan Castle, the history of which was related by Mr. C. H. Compton, V.P. Saturday was taken up with a visit to Carnarvon Castle. The ancient collegiate Church of Clynog was also inspected and described by Mr. Charles Lynam, F.S.A. On Monday the Bangor and Beaumaris district was visited, the chief attractions being the Cathedral and the Castle. Yesterday was taken up with the Caerhun, Llanrwst, and Bettys-y-Coed district. To-day (Wednesday) the Llandudno, Colwyn, and Llanrhos district will come under notice, and Bodysgallen, the residence of Lady Augusta Mostyn, with Gloddaeth Hall, the seat of Lord Mostyn, will be inspected. Each evening papers are read at the Conway Guildhall.

DEGANWY CASTLE AND ITS HISTORY.

Lord Mostyn, the President, in his inaugural address, took for his subject the history and description of Degany and its ruins. The Association, his lordship observed, had been fortunate in selecting Conway as the meeting-place for the year. The town had rarely had the honour of receiving so many learned guests, and yet there were few places that represented such a variety of objects interesting to the antiquary. In the old castle and town walls they had, perhaps, the most perfect specimen of Saracenic Architecture to be found anywhere—at any rate, in Great Britain. At Conway they saw the mural defences of the town almost in the same condition in which they were left by the military engineers of Edward I. In almost every direction, too, they could find traces of ancient British fortifications and tumuli, and to those interested in crosses, inscribed stones, and other remains of that character, there were a variety of specimens to be found in the neighbouring county. Close by, at Caerhun, was a considerable Roman settlement, identified as the old Roman station of Canovium. At Carnarvon would be found the remains of another Roman station, Segontium. In the castles of Conway, Carnarvon, and Beaumaris they had three of the finest fortresses built by Edward I. At Degany they had the foundations of the first Norman castle, the Architectural features of which have been traced out by Mr. E. W. Cox, of Liverpool. Degany was his (Lord Mostyn's) own property, having been brought to his family, together with the Gloddaeth estate, about the time of Richard II. by his ancestress Margaret, the descendant of Iorwerth ap Madoc, who possessed it before the time of Edward I., probably after its seizure by Prince Llewellyn ap Griffith. He hoped at some time to carefully excavate the foundations and to carefully preserve the remains.

THE RUINS NOW REMAINING

were those of the castle built by Hugh Lupus, Earl of Chester, at the end of the eleventh century. This northern Palatine Earl was said to have appointed his kinsman Robert, Baron of Rhuddlan, as constable of the castle. He was killed near the Great Orme's Head by Griffith, King of Wales, in 1088, and his body was buried in the monastery of St. Werburg, Chester. In 1210 the castle, after being demolished by Llewellyn the Great, was entirely rebuilt by Randle Blundeville, Earl of Chester. In 1263 it was again totally demolished by Llewellyn ap Griffith. In 1282 King Edward I. came to Conway with a large army, when a peace was made with Llewellyn. War was, however, shortly again declared, and the King, who had made Rhuddlan his headquarters, advanced with

his army to Conway. Llewellyn was killed, and Wales annexed to England. Then it was that Edward completed the rebuilding of Conway Castle, and, having removed the Abbey from the town higher up into the Vale of Conway, surrounded the town with walls, making use, it was said, of the materials of the old Norman Castle at Degany for the purpose. His lordship then proceeded to deal with the remains of the old castle. Faint traces were to be found of the old city. The castle itself consisted of three parts. The great central courtyard lay between the hills and the defences of the smaller hill. The works on the great hill constituted a complete castle in themselves, and included a reservoir for the supply of water. It was probable that the entrenchments only existed with the Norman castle, and that the bulk of the masonry was later work. The lesser hill had for its central defence a bastion occupying the narrow summit. The plan of the castle, which Lord Mostyn described in detail, was, he said, somewhat intricate, and the erection of the various works had doubtless involved enormous labour. Nevertheless, it had many weak points as a place of defence, and the capture of the castle was evidently effected at its weakest points, the walls having been undermined and thrown down in huge masses. The rest of the buildings had been differently treated, and the tradition that the materials were taken to Conway was corroborated by the fact that the walls were not overthrown as was the gateway and the keep, and also by the fact that portions of the Conway town walls were built of similar materials to those to be found at Degany.

LONDON EYESORES.

IN an interesting article on this subject, the Daily Mail says, speaking especially with reference to chimney-stacks:—No stereotyped form is demanded of them. There is charm in variety. They may be twisted or straight; plump or slim; tall and gaunt; or small and podgy. But they must not be ugly. Unfortunately, however, there is no sanction appended to this law, and chimney-stacks can be as ugly as they well know how. To their ingenuity in this direction we bear willing testimony. They have immense power. It is theirs to break the skyline into shreds and tatters, or beautify it with modest pinnacles of elegant and fantastic shapes. They can complete the landscape or ruin it. They can distract attention from, or guide it imperceptibly to, a fine effect. Great, therefore, is the function of chimney-stacks! They have a double duty; to those who live in their house—for the houses may be said to belong to the chimney-stacks—their duty is to emit smoke and prevent the wind from blowing down them. To those outside they owe a higher duty—to fulfil their obligations to skylines and the scenery in general. How do the chimney-stacks of London do their duty? As a general rule they emit smoke only too voluminously; but as regards skylines they may be said to massacre them with fiendish glee. Nothing succeeds like success; and to-day you may see the

MOST HIDEOUS CHIMNEY-STACKS

sitting triumphant on the roofs of the best houses in town. From far along the Edgware Road and Cumberland Place they squint down with comfortable vulgarity on the Marble Arch. They crown Park Lane, squatting like harpies, of all sizes and shapes, on the abodes of our aristocracy. Everywhere they are triumphant. Look at them for a moment! They are made of zinc, and sometimes are straight and cylindrical; sometimes they bend their necks in ungraceful imitation of the swans; sometimes they seem to be peering over the edge of the roof with crooked knees and sloping backs, or like hooded snakes regard with impassive malignity the distant horizon. They are ugliest, however, when a dozen or so of them combine to present the appearance of an unfinished organ for the production of smoke instead of sound. You could almost laugh to look at them; they are an object-

lesson on the benefits of combination. The fatuousness of the thing, too, cannot but strike you; for a bunch of them very nearly destroys a fine view of the Houses of Parliament from Piccadilly Circus. The view is in no way obstructed, but the eye is impeded and distracted by them. The curious thing about nearly all these objectionable chimney-stacks is that they are makeshifts, not, designed in the original plan of the building, but

AFTERWARDS FOUND NECESSARY,

and then erected at as little cost as possible, but with limitless opportunities of continuing the great crusade against beautiful skylines. The Constitutional Club in Piccadilly affords a good example of what may be done unintentionally to destroy one aspect of a handsome building when additions are found necessary, if such an excuse can be offered in this case. As you approach the Constitutional Club from Hyde Park Corner you get the view shown in the sketch herewith. So much of the building as may be properly included in the façade is well designed, and in keeping with the whole effect. But there the artistic efforts of the Architect seem to have stopped short, with the result that side by side you have a well designed and effective bit of stone masonry and a section of brick wall surmounted by diminutive chimney-stacks that might at an earlier date have formed part of the wall surrounding a villa in Suburbia. Not that there is anything necessarily inartistic in the garden wall of a villa in Suburbia, but its proper place is certainly not on a building overlooking the Green Park. The juxtaposition of carved stone and a parallelogram of dingy yellow bricks is so ludicrous as to be intolerable. You might as well be presented at one glance with a view of the kitchen and the dining room, in the hope that they would harmonise well because of the community of interests they represent. As a final example of our civic carelessness as to skylines, take that very temple of Art itself,

THE NATIONAL GALLERY.

Here, if anywhere, you would imagine that the most self-opinionated of critics could find nothing to grumble at. But, alas! it is not so. The carping critic has good reason to complain of the manner in which the skyline above one of the finest sites in Europe has been botched. The original design is obvious enough. There is nothing very magnificent about it. A rather small dome, flanked by smaller domes, is unoriginal enough to be familiar, but it makes a simple and effective skyline. But what are those that crowd on the housetops of Britannia's temple of Art? A little way back from the central dome you may behold a squat sexagonal structure with a good deal of glass about it, that you could imagine to have been imported thither from some East End theatre of varieties. Something got anywhere, and dumped down anyhow. The diameter of it is bigger than that of the dome, which is therefore made to look less than it really is, which it really can't afford to be. Behind the sexagonal affair—we are at a loss to know what to call it—rises the tower of the new National Portrait Gallery. You cannot help asking what it is doing there. Again, on the far side of each of the smaller domes, you have at the one end a dirty little crook-headed zinc chimney-stack, and at the other something that looks like the inverted pedestal of a statue. Probably it is a ventilator. Everything is out of relation to everything else, and the whole effect is enough to make the original Architect turn in his coffin. But, in conclusion, we may turn from skylines, and glance at something that is on a level with our eyes. The Palace Theatre of Varieties was intended to be the English Opera House, and the Architect did his best to make it worthy of its original purpose. Not only is the whole effect very fine, but every detail has been carefully imagined, and carved out in stone. But, in spite of what it ought to be, a trifling little porch has been erected, which conceals a considerable portion of the stonework of the building, and disturbs the whole effect.

Professional Items.

ABERDEEN.—The Plans Committee of the Town Council has had before it plans of the following buildings, viz.:—Addition at rear of premises on the north side of St. Clement Street, for Messrs. G. and W. Davidson, per Messrs. Brown and Watt, Architects. Two dwelling-houses on the north side of Broomhill Road, for Mr. W. Murray, per Messrs. Brown and Watt, Architects. Addition at rear of northmost of four dwelling-houses on the west side of Ferryhill Road (approved on 20th May last), for Mr. A. Melville, C.E. Workshop at South Esplanade, for Mr. John Rasmussen, per Mr. William Malcolm. The Committee had also before it plan of alterations and additions in connection with property on the east side of Leslie Terrace at its junction with Stafford Street, for Mr. Alexander Thomson, builder. The Committee approved also of the following buildings, viz.:—Six dwelling-houses on the north side of Hamilton Place, for Mr. Robert Smith, per Messrs. Brown and Watt, Architects. Six dwelling-houses on the south side of Hamilton Place, for Mr. John Henderson. Dwelling-house on the south side of Wood Street at its junction with Baxter Street, for Mr. Robert Rainnie, per Messrs. Harper and Sutherland, Architects. Two dwelling-houses on the north side of Osborne Place, for Mr. William Buchan, builder. Four dwelling-houses and shops at the junction of Rosemount Viaduct and Skene Terrace, for the Aberdeen Town and County Property Company, Limited, per Messrs. Brown and Watt, Architects.

The demolition of the properties at the extreme north end of Union Terrace and North Silver Street, begun the other day, is the outward indication of a very considerable improvement that is about to be effected in that quarter. The properties in question were acquired for a new limited liability company, with the view of having erected at this point a new club, to be run on popular lines in connection with the Unionist cause in Aberdeen. At the Town Council meeting reports were submitted relative to the sanctioning of the elevations of the proposed buildings. These new buildings will not only form a convenient and handsome location for Unionists in the city and county, but will go a long way to complete the architectural amenities in a locality which has come to be regarded as standing above all others in Aberdeen in respect of the distinguished character of its buildings. To make way for these buildings, the house at the north end of Union Terrace is being removed, and the three similar houses in North Silver Street, so that the Union Club buildings will have a frontage to Union Terrace, Skene Terrace, and North Silver Street. The frontage to Union Terrace and Skene Terrace will be of a circular form, the buildings sweeping round the corner and giving a complete finish at that end to the buildings of Union Terrace. The block will consist of two parts, a main block—extending 100ft. from the adjoining house in Union Terrace—and, secondly, a hall block fronting Skene Terrace of a slightly less ornate appearance than the main building. The premises are in the Renaissance style of architecture, and are to be built of white Kemnay granite, finely dressed, in keeping with the numerous other public buildings which have been erected in that vicinity. The building consists of three stories, the chief architectural feature being the French Pavilion design of the centre portion. There are two entrances. The main entrance to the club portion of the buildings is at the south end, in Union Terrace; and for the hall portion of the buildings the entrance is at the other end of the main block. Between these doorways the ground floor of the main block is to be utilised as three large shops, with an amplitude of space for the display of goods, divided by pilasters of smooth white granite. The internal arrangements are carefully calculated to meet the requirements of a club such as is intended to occupy this main block. From the vestibule to which the club doorway gives

entrance a wide staircase rises to the first floor. Here the front portion is divided into a smoking-room, 24ft. by 30ft.; reading-room, 20ft. by 34ft.; and refreshment-room, 26ft. by 23ft.—all lighted from the front by three windows each. At this level also, towards the back, and entered from the separate doorway, will be the buffet, supper room, and kindred accommodation available in connection with the adjoining hall. On the second floor of the main block is a large recreation room, a committee room, and caretaker's quarters, which are continued in the higher part of the pavilion. At the level of the second floor, and above the adjoining hall, is to be situated the billiard room. The hall will accommodate an audience of about 600. The cost of the new buildings—of which the Architect is Mr. A. H. L. Mackinnon, Union Street—will be between £9000 and £10,000.

ARKLOW.—The new parochial house in Arklow was designed by Mr. William Hague, Architect, and was erected from his plans and under his supervision by Mr. Robt. O'Connor. It is built of rubble masonry, and the walls are cemented interiorly and exteriorly. The internal appointments are good, and the rooms are handsomely furnished. The building was commenced early in 1895, and was completed within the same year. It was erected at a cost of £1750.

ATTERCLIFFE.—A company is being floated to build a music hall. The site secured is on the busy main thoroughfare, only a few doors from the Queen's Head Hotel. The Architects are Mr. G. D. Martin and Mr. A. Blomfield Jackson. The building, which will be begun as soon as the Highways Committee has sanctioned the plans, will have a holding capacity of over 2000 in the pit and circle, and arrangements are to be made for adding a gallery later if it is needed.

BARRY.—The improvements at Barry Station, which form part of an important scheme of reconstruction on the Dundee and Arbroath Joint Railway system, has just been completed. Barry Station now presents a very different appearance from that which it has worn for so many years. On the spacious new island platform there has been erected a large range of offices and waiting-rooms. The structure is of polished pitch pine, with overhanging verandahs, supported upon massive metal brackets. At the west end accommodation is provided for the offices, and adjoining these are commodious general and ladies' waiting-rooms. Sanitary conveniences of the most modern type have been provided. The small wooden house which formerly did duty as a waiting-room on the south platform now occupies a position on the north side. The lighting of the platforms has been considerably improved, and a number of other minor improvements have been carried out. The contractors for the work were Messrs. D. P. How and Son, Dundee.

BRADFORD.—A faculty will shortly be applied for in the Consistory Court of Ripon authorising the removal of the north and south galleries, the erection of new clergy and choir vestries and north and south transepts, and other alterations required in the Bradford Parish Church. The citation sets forth in minute detail the various proposed new works and restoration of some of the older portions, and is accompanied by plans prepared by Messrs. Healey, the Architects. It concludes by affirming "that no carved work in wood or stone, no stained-glass window or ornamental work in metal or other material, and no ancient window, doorway, or other specimen of ancient architecture would be destroyed or interfered with in carrying out the works." The estimated cost is stated to be about £4000, and the works are to be completed within twelve months from the time of the faculty being obtained.

CARDIFF.—Nearly every other man has a scheme for improving Cardiff. Some are plausible, many are not; a few are practicable. Mr. P. Williams, of Newport Road, has elabo

rated a scheme of a threefold character. It provides for an improved route from Bute Street to the Taff Vale Railway Station, the widening of Bute Street, from canal junction to the Great Western Railway bridge, with a relief street from Bute Street to Custom House Street, and the widening of Pembroke Terrace. The present route from the Great Western Railway Station and the Bute Street district to the Taff Vale Railway Station is very circuitous, and it is proposed that as there is some probability of a lot of property on the western side of Bute Street being acquired at moderate rates, it should be bought up and thrown into the street. Mr. Williams suggests that the corner between Hope Street and Crichton Street should be taken off, which would make a convenient approach from Custom House Street, and thus provide a relief street, and at the same time enable people coming from the western direction to evade the dip under the Great Western Railway bridge over Bute Street. He next proposes that the small shops at the corner between Bute Street and Bute Terrace should be set back, so as to give greater facility for dealing with a congested spot. Mr. Williams proposes that the feeder from the end of Bute Terrace to Guildford Street Bridge should be covered over, and an entirely new road provided. This would afford a short cut through to the Taff Vale Railway Station. Combined with this part of the scheme, Mr. Williams proceeds to deal with three awkward corners—one at the junction of Guildford Street and Nelson Terrace (or Bridge Street), one between Guildford Crescent and Guildford Street, and one at the junction of Guildford Street and Lower Station Terrace. To do this he proposes that the feeder should be covered for a short distance on the Pembroke Terrace side of the Guildford Street Bridge, which will afford an open space, and enable people to avoid the opposite corner, whilst he would take a slice off from the corner of Edward Street into Station Terrace, which would provide a fine open approach to the station yard. The final portion of the scheme is the proposal to widen Pembroke Terrace by setting back the wall to the edge of the water at the feeder. If this were carried out it would give a roadway of over 40ft. wide, offering a convenient outlet for traffic into Queen Street.

CARLTON.—The foundation stones of a new Methodist Free Church were laid at Carlton on Thursday. Plans and estimates were prepared by Messrs. R. E. and E. R. Sutton, Architects, of Nottingham, and the contract is in the hands of Mr. J. Lewin. The cost will be £2600. The new building has an imposing frontage to the main thoroughfare. The front elevation will be of a late Gothic character, built of pressed red bricks, with Derbyshire stone dressings, and will contain a fine Gothic window of Cathedral tinted glass, with four smaller windows of a similar character.

CLECKHEATON.—The roofing of the new Liberal Club has just been finished, and the structure is rapidly approaching completion. Both externally and in its internal arrangements the new building is a satisfactory achievement, and, from an architectural view, corresponds most favourably with the many other public buildings in Cleckheaton and Spen Valley.

COLCHESTER.—The design for the new Town Hall at Colchester, to which the first premium has been awarded, is that by Mr. J. Belcher. There were three prizes offered in connection with the competition, the other premiated designs being those submitted by Messrs. Lanchester, Stewart, and Rickards and Mr. Mountford respectively. The competition will form the subject of an illustrated article in an early issue of the BUILDERS' JOURNAL.

DOUGLAS.—The Douglas Town Council has approved of the plans of the scheme of Messrs. Stevenson and Burstall, of London, for the reconstruction of the Douglas system at a cost approaching £50,000. The tender of the Stanton Ironworks Company Limited, Nottingham, for the supply of iron pipes in con-

nection with the scheme for £2481 was accepted.

EDINBURGH.—The work of relaying the roadway in the centre of North Bridge Street to suit the gradient of the new North Bridge has now been completed. The new roadway, which is really of a temporary character, has to be raised about four feet at its lowest end, where it meets the southern end of the bridge, and in order to accomplish this, and leave the pavement on each side untouched, the edges were constructed of brickwork, on which the gradient was carried out southward till it met the old street level at the Tron Church. The centre of the street will now accordingly present one gradient from the Register House to the Tron Church. Along with the roadway there had also to be laid, of course, a new track for the tramcars.

The erection at Edinburgh Castle of the new military hospital, for which £18,000 was recently voted by Parliament, is now being rapidly proceeded with. The site of the new hospital is at the north-west corner of the Castle rock, overlooking Princess Street and Castle Terrace. The buildings are to be treated in the Scottish baronial style of Architecture, and will harmonise with the older portions of the castle—more than can be said of some of the hideous modern erections that disfigure the ancient stronghold. The buildings will, it is expected, be ready for occupation in about a year.

ERWOOD.—The restored Church of Llandilo Groban, near Erwood, was re-opened a short time ago. During the past twelve months the building has been in the hands of the workmen, and under the direction of the Architect, Mr. E. Collier, of Carmarthen, the chancel and nave have been faithfully restored at an expense of about £600, of which the Ecclesiastical Commissioners contributed £200. The tower has yet to be restored.

FORDHAM.—The foundation stone of the hall and institute which are being built by public subscription to commemorate the Jubilee was laid on Thursday by Mr. Alexander Peckover, Lord-Lieutenant of Cambs. The building, which is being erected by Mr. H. Boon, of Fordham, from designs by Messrs. Gordon, Lowther, and Gunton, of Finsbury House, Blomfield Street, London, will contain a hall 56ft. by 28ft., a reading-room, and a room for games, each 18ft. by 14ft. 6in., and rooms for the caretaker, and has a well-designed exterior.

HUDDERSFIELD.—No fewer than thirty designs have been received by the Huddersfield Jubilee Castle Hill Tower Committee. After having been adjudicated upon, they will be placed on public exhibition in the rooms in Byram Street shortly to be prepared for the purposes of the Free Library.

LEEDS.—Various street improvements were considered at a meeting of the Streets and Sewage Committee of the Leeds Corporation held on the 18th inst. These included improvements in Mill Street, Meadow Lane, Camp Road, Woodhouse Lane, Chapeltown, and the junction of Woodhouse Lane with Cobourg Street. It was resolved to proceed with the work at those places. The Committee decided last week to accept a contract for about one thousand tons of coke breeze for the purpose of carrying out at Knostrop Sewage Works Mr. Dibdin's system of sewage purification. A deputation was appointed to meet the West Riding Rivers Board in October next, to consider the question of sewage disposal in Leeds.

LOWESTOFT.—The foundation stone of a new children's hospital at Lowestoft was laid recently. The new structure is situated on a piece of land immediately to the north of the existing hospital, with which it will be connected with a covered corridor. The building will consist of one ward for six beds, and the plans show that special care has been taken with the ventilation and heating. The lavatories and bath-rooms are very complete and adequate. There will also be in connec-

tion with the institution a ward kitchen and an isolation ward for two beds, with its own bath-room and lavatories. The children's ward is 26ft. by 24ft., and the isolation ward 20ft. by 17ft. The building has been designed by Mr. W. J. Roberts, Architect, of Lowestoft, and will be erected by Mr. Bedwell, builder.

NEWCASTLE.—At a meeting of the Town Improvement Committee of Newcastle Corporation, the City Engineer (Mr. Laws) presented a report as to making wood pavements, and also the use of granite sets in several of the principal streets of the city. It is proposed to pave Grainger Street, Neville Street to Derwent Place; Northumberland Street, from St. Mary's Place to Pilgrim Street, with wooden blocks. Blackett Street is already being paved with that material. It is also proposed that from the Grand Hotel to Newgate Street, and also along Clayton Street, granite sets be laid. The probable cost of the paving of the streets with wood is estimated at £18,500; and for the granite set pavement, £7500, or a total of £26,000.

PADDINGTON.—Mr. John Aird, M.P., laid the foundation stone of the new Metropolitan Theatre of Varieties, Edgware Road, a week ago. The new building will stand on the site of the old house, and when completed will be equal to any of the music-halls of the Metropolis. A part of the original structure has been preserved, but the auditorium will be completely reconstructed, and the seating capacity of the house will be increased to 3000. The stage will be enlarged, and new dressing-rooms provided, while every attention is being paid to exits and precautions against fire. An entirely new frontage is to be erected, additional premises having been purchased on the right of the former house. The work of reconstruction was commenced three months ago, and it is hoped that the theatre will be completed and ready for opening by the end of November.

PAISLEY.—At Paisley Burgh Dean of Guild Court on Thursday, Mr. Charles Buchanan, builder, Glasgow, was authorised to erect fourteen four-story tenements of dwelling-houses and shops in Caledonia and Hunter Streets. Mr. William Terrel obtained consent for a three-story tenement at Meikleriggs; and there were also passed plans for the erection of a new factory and warehouse, 73ft. long, and four stories in height, and several smaller additions at the works of the Paisley Co-operative Manufacturing Society (Limited) at Colinslee.

QUORN.—Memorial stones were laid on the 18th inst. of a new Baptist Sunday School at Quorn. The existing chapel is situated in the Woodhouse Road, but has hitherto been shut in by cottages fronting it. The cottages were purchased by the chapel authorities, and the enlargement of the school accommodation decided upon. Mr. T. North is the Architect of the new building, the contract for the work having been let to Mr. Horspool, of Quorn, for the sum of £420. There will be accommodation for 100 children. The lower part of the new structure is to be of granite stone, the remainder above of red brick, covered at the roof with Swithland slates. Internally, the woodwork will be of pitch pine, and the heating will be by hot water.

SHIPLEY.—A special meeting of the Shipley District Council was held last week for the purpose of opening the tenders for the new sewerage works. The Shipley scheme comprises a trunk sewer from the outfall works at New Market Farm, along the bank of the river Aire, and thence up the north and west boundary of Shipley to Stoney Ridge; and a trunk sewer from the outfall works by Bradford Beck to the Shipley boundary at Frizinghall, this sewer being intended to drain both sides of the valley. There were seven tenders, and that of Mr. William Foster, of Bingley, which was under £14,000, was accepted. For the works comprised in the Windhill main sewers there were fourteen tenders, and that of Messrs. Rhodes Bros., of Shipley, which

was under £5000, was accepted. The engineers engaged are Mr. M. Paterson (for Shipley) and Messrs. W. B. Woodhead and Son (for Windhill). The estimated cost of the entire scheme (including the defecation works) is £55,000.

TIBSHELF.—It has been decided to erect a new Methodist chapel at Tibshelf. The site of the proposed building is in Addison Street, and when completed will provide accommodation for 600 persons. The Architect is Mr. A. E. Eyre, of Conder. The memorial stones were laid a few days ago.

WIGAN.—The reredos in the Parish Church has been altered and adorned by Messrs. James Powell and Son, of London, who are doing the mosaic work in St. Paul's Cathedral. The stone work is unaltered, except in the centre, where the two panels over the altar have been thrown into one and raised, so as to allow room for the retable. The back of the retable is adorned with medallions, containing the instruments of the Passion, and above is the Heraldation of the Lamb, the Church being represented by five New Testament Saints, and five representatives of the English Church. On either side of the altar the niches have been filled with statues in stone of St. Michael and St. Gabriel. The four long panels, two on each side, show figures of David, Isaiah, Zechariah, and St. Paul. Each of these holds a scroll containing an extract from his writings, speaking of the priesthood of Christ. The heads of the canopy are adorned with gilding. New altar rails in iron from the workshop of the same firm have been put in the places of the old heavy ones, and a handsome oak credence table has been placed in the sanctuary. The total expense is about £380.

ONE of the largest strikes ever experienced in the Black Country brick trade has commenced at Oldbury. About 800 brickworkers ceased work for an advance in wages of 20 per cent. The men complain that the employers have refused to concede any advance whatever, and have declined to meet the men or their representatives in conference.

In his native town of Shrewsbury, and in front of the school which for nine years he attended, a statue has been unveiled in memory of Charles Darwin. It is the work of Mr. Horace Montford, and represents the naturalist seated in a massive chair, holding some MS., while at the foot are a number of volumes representing his finished works. The statue, which is of bronze, is the gift of the Shropshire Horticultural Society.

It is announced from Paris that the Academie des Beaux Arts has decided not to award the Prix de Rome for painting this year, as none of the competitors have shown sufficient merit to justify any selection. Two second prizes have been given, and a special third prize has also been provided as a consolation; but the withholding of the chief award has caused something like consternation among the younger French artists.

A band of sixty workmen, employed by Messrs. Harrison and Spooner, College Street, are now engaged in repainting and re-decorating Blackfriars Bridge. The work will take three months. The painters are giving the old bridge a new coat of purple oxide, the decorated parts being "mock bronzed," and the buttresses washed down. The last time the bridge was repainted was in 1888, and previous to that in 1876, the work being done by the firm now employed.

The East London Art Exhibition, promoted by Mr. A. F. Hills, will close at the end of the month, and will be followed on October 2 by a Diamond Jubilee Trades and Inventions Exhibition. Special facilities are offered for the exhibition of inventions and novelties (patented during the last sixty years) in building, architecture, joinery, &c., ship-building and engineering, electrical and other lighting, textile and clothing arts, furniture and decoration, printing, publishing, book-binding, &c.

Correspondence.

CARDIFF NEW TOWN HALL AND LAW COURTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As will be seen from your advertising columns, Cardiff contemplates the erection of a town hall and law courts on a scale befitting its importance as a centre of wealth and population.

For this purpose the Corporation have lately purchased from the Marquis of Bute a finely timbered park of some sixty acres. This magnificent site is bounded on its south by the Feeder, an artificial but beautiful river, by which the waters of the Taff are carried to the docks. There is a singular charm about this rapidly-flowing stream, here entirely over-arched by trees, with the lawn and garden around the ruins of the Grey Friars monastery on the one side and the park aforesaid on the other.

The spot appropriated to the building in question is within a stone's throw of the Feeder, and not three minutes' walk from the centre of the life of Cardiff; yet scarcely a trace of the near neighbourhood of a great town is visible from it. This is partly accounted for by the fact that the grounds of Cardiff Castle bound the park to the west, with only a road and canal intervening. It struck the writer on visiting Cardiff that the Corporation had secured an unrivalled site for their future municipal buildings.

It is to be hoped, therefore, that something worthy of the opportunity may result from the competition which has been determined upon for the buildings in question. The time allotted for the work is short, but, from the circumstances of the case, cannot be extended. The conditions are, I think, more favourable than usual.—I am, Sir, yours obediently,

A. WATERHOUSE.

August 19th, 1897.

THE ARCHITECTURAL ASSOCIATION.

SYLLABUS FOR NEXT SESSION.

THE curriculum for the session 1897-98 has already been issued, and may be taken as heralding one of the busiest sessions in the history of the Association. The Architectural Association is essentially an educational body, and the sphere of its activity, and therefore the extent of its utility, is yearly increasing, to the gratification, not only of the members, but of many well-known Architects who have interested themselves in the institution since its inception. There are many known names in the list of lecturers and instructors, and the classes, &c., promise to prove equally, if not more fruitful than in previous sessions, the subjects embracing a collection both wide and comprehensive. The ordinary meetings of the Association will take place on alternate Fridays as heretofore, and the topics on which papers will be delivered are as follows:—"Practical Lessons from the Paris Fire Bazaar," Mr. Edwin O. Sachs; "Classification of Trades," Mr. S. Flint Clarkson; "Some New Materials for Use in Building," Mr. H. D. Searles-Wood; "The Planning of High Schools and Endowed Schools for Girls," Mr. J. Osborne Smith; "House Painting," Mr. L. A. Shuffrey; "Composition in Regard to Public Buildings," Mr. F. T. Baggallay; "Hampton Court Palace," Mr. John Belcher; "Leadwork: Plain and Decorative," Mr. F. W. Troup; "Scottish Ecclesiastical Architecture in the Fourteenth and Fifteenth Centuries," Mr. Hippolyte J. Blanc; "Constructional Steelwork," Mr. T. C. Cunningham; "The Morality and Economy of Competitions," Mr. H. B. Creswell; "Interior Lighting," Mr. W. Eckstein; "Electric Lighting as Applied to Architecture," Mr. T. Ekin; "Foundations as Applied to London Buildings and Riverside Foundations," Mr. A. T. Walmisley.

SOCIETY MEETINGS.

Cambrian Archæological Society.—St. David's Cathedral, which was visited a few days ago by the Cambrian Archæological Society, is almost as inaccessible at the present day as it was seven centuries ago. The only halt en route to the Cathedral was at Brawdy, where, in addition to the Church, which is an interesting specimen of the small Pembrokeshire Churches, are three inscribed stones of considerable importance. At St. David's the visitors were met by the Rev. Chancellor Davey, who, after the company were marshalled in the Cathedral nave, read a short description of the edifice. His remarks were frequently supplemented by Mr. Stephen W. Williams, who pointed out the resemblance between the details of the very late Norman transitional work and those of Strata Florida Abbey. He had come across practically identical work in the west end of Llandaff Cathedral, for the drawings of which he was indebted to Mr. Seddon, of St. David's, and he had no doubt that a band of Welsh workmen belonging to the same Guild had worked in the construction of the three greatest ecclesiastical edifices of mediæval Wales, and had imparted to the details of each a touch of artistic feeling which was essentially Celtic. Several members, accompanied by Dean Howell, went as far as the Chapel of St. Non, the supposed birthplace of St. David. Nothing is now left of the chapel but the four walls. To the north-east is the Saints' Well, covered with a stone roof.

Yorkshire Master Builders.—A meeting was held recently at Huddersfield of a number of master builders from most of the Yorkshire towns, particularly the districts of Holme, Colne, and Spen Valley, to consider the advisability of forming a federation for Yorkshire. The chair was occupied by a local master builder, and the meeting was well attended. Representatives were present from the Lancashire Federation of Master Builders, who explained the objects and working of that society, and the success which it had attained in Lancashire. It was mentioned that since the federation had been formed there had been fewer strikes and a mutual good feeling had been engendered between the masters and operatives. The meeting passed a resolution affirming the general desirability of establishing such a federation, and then steps were taken to form one, and the preliminary rules, on the basis of the Lancashire federation, were considered and adopted. Broadly, the objects of the Federation are to enable contractors to make more satisfactory terms with Architects and engineers with respect to agreements for the carrying out of contracts; also the better conduct of the working rules with the operatives. It is part of the general movement which is taking place in the North of England. The next meeting will be held at Leeds on September 15th.

Mr. Woodrow, of Chancery Lane, is the Architect for the rebuilding of Collins's Music Hall at Islington Green.

New warehouses are now being erected in Old Barge House Street, S.E., for the Civil Service Supply Association, at a cost of over £25,000.

A TERRIBLE accident recently occurred to a number of builders at Boxenden, near Accrington. Some scaffolding, bearing five men engaged in the erection of extensive chemical works for the Nicol Chemical Company, fell from the third story, and the workmen were precipitated a distance of 50ft. Two of them were killed instantaneously, and two others severely injured.

A WOODEN bridge which carries the Great Eastern Railway across the Waveney, near Somerleyton, Suffolk, took fire a day or two ago. The bridge appears to have been ignited from the funnel of a small steam launch, as flames were observed proceeding from the woodwork soon after the launch had passed beneath it. About twenty feet of the woodwork was destroyed before the fire could be subdued.

Trade and Craft.

THE IRISH TUNNEL SCHEME.

The Council of the Belfast Chamber of Commerce has adopted the report of the deputation which waited on Mr. Ritchie, President of the Board of Trade, in reference to the tunnel between Wigtownshire and County Antrim. The report states: "The deputation think it necessary to assure the Council that they adhered strictly to the instructions they had received, and did not suggest directly or indirectly that the Government should commit themselves to the construction or financing of the tunnel at all. Your deputation referred to the strong engineering evidence before them, simply to justify and call for inquiry and examination by trial borings and soundings, and the preliminary inquiry which we considered absolutely essential to the formation of anything like a sound opinion on the subject. The estimate for this is £15,000. They beg to say that nothing that fell from the President of the Board of Trade seems to them sufficient to justify any change in the view taken up by the Council. We are not at present sufficiently well informed to say that Mr. Ritchie may possibly be right in some of his conclusions, but he may be wrong—as far, wrong as Lord Palmerston was in considering the Suez Canal impossible, or Lord Derby in declaring that no ship could cross the Atlantic propelled by steam alone. The deputation also notice with regret that the figures used by Mr. Ritchie in his argument are extremely inaccurate, and they think further that the suggestion that the Government might be deterred from such an enquiry by the fear of opposition of interested parties is a very singular and unusual objection. On the whole your deputation is of opinion that the subject remains before us precisely as it was. Nothing has occurred to alter the position in the slightest degree."

MANCHESTER TRAMWAYS.

At a meeting of the Special Committee of the Manchester Corporation as to the working of the tramways, it was resolved to recommend that when any change takes place in the motive power used on the tramways in the city, the new motive power adopted shall be electricity, to be supplied from the electricity works of the Corporation. This resolution is intended to take effect whether the working of the tramways remains as at present in the hands of a Company or is by-and-bye taken over by the Corporation. The resolution recorded will be of value to the Electricity Committee as to future demands which it will be called on to meet.

TENDERS FROM FRANCE.

The Directors of the Record Mill Company, of Ashton-in-Makerfield, recently asked for tenders for engines and boilers for the new spinning mill they are building. In consequence of the very high prices quoted by the various firms who have tendered, the Directors have, it is stated, decided to obtain tenders from French makers before placing their contracts. The explanation given for the high rates quoted is the uncertainty of execution and probably enhanced cost which the various firms had to keep in view consequent on the trouble in the engineering trade.

OPEN SPACES: AN IMPORTANT DECISION.

Mr. George M'Pherson, Pomarium Street, Perth, recently applied for permission at the Dean of Guild Court to erect dwelling-houses and offices on vacant ground behind the tenement at 80, Pomarium Street. The Burgh Surveyor and Mr. William Neilson, an adjoining proprietor, lodged objections to the permission being granted on various grounds, the most important of which was that the rooms at the back of the buildings were not provided with the necessary light or air space required by Clause 170 of the Burgh (Scotland) Act, 1892. The contention of the objectors was that this clause required any space from which any of the rooms were lighted and

ventilated to be equal to at least three-fourths of the area of the intended building. The case was debated before Bailie Wright, who repelled the objections and granted the petitioner his lining.

A BUILDING DISPUTE.

At the Pontypridd County Court on Thursday (before His Honour Judge Gwilym Williams), Charles Telford Evans, Architect, Cardiff, sought to recover £42 from W. Jenkins, builder and contractor, Cilfynydd, in respect of building stone supplied. There was also a counter claim for £9 15s. 3d. paid into Court by defendant. The action was a remitted one, and Mr. Williams explained that the only point in dispute was as to whether defendant had agreed to pay 2s. or 2s. 6d. per load. Plaintiff stated that he supplied the stone from his quarry at Llanhilleth, and had made a contract with the defendant and his manager, Mr. James, that he was to receive 2s. 6d. per load.—Defendant and Mr. James were called, and swore that plaintiff had agreed to supply the stone at 2s. per load.—Henry Ellis, a quarryman, was called, and said he would have been prepared to supply the stone at that price.—Judgment was given for Mr. Jenkins in respect of the claim and counter claim.

DOUBLE DOVE-TAIL FIXING BRICK.

An invention of no little ingenuity and practical utility to builders has just been placed upon the market by the patentee, Mr. W. G. Spratly, of Hammersmith. The double dove-tail fixing brick seems to have a distinct mission to fulfil, and to do that effectually. It has been designed as a fireproof substitute for the ordinary wood fixing-block or plug, and consists of a framework of iron divided into two compartments, the rear space of which may be filled

in with any fireproof material, while the front portion holds a wooden block to which can be secured any desired article either by nails or screws. The contrivance is suitable for suspending telegraph wires in tunnels, and also for firmly securing to walls such objects as heavy advertising boards. All that is necessary is to take out an ordinary brick and replace it with the new fixing brick. But perhaps the great value of the invention consists in its fireproof qualities when inserted into chimney breasts for holding the skirting boards; the fireproof cement protects the fixing block and all adjoining woodwork from the fire of an overheated chimney. When it is remembered that, with a view to the diminution of the risk of fire, the Building Act now requires that 12in. of brickwork shall be placed between the flue and any wood work, such as a skirting, it must be conceded that Mr. Spratly's patent possesses advantages not met with elsewhere. The dove-tail fixing brick complies with the Act in this particular, and its use ought certainly to obviate the necessity of such an increased thickness of brickwork. The invention, we are told, has been designed to render 4½in. work fireproof, but if we take the chimney breast at 9in. in thickness, the saving of 4½in. represents what may be an average of twenty cubic feet for each fireplace. Here is an appreciable saving in expenditure; but the gain is also considerable in cottage and villa property, where breathing space is valuable. It is more than probable that the building trades will look with favour upon this invention, particularly if its use is calculated to so alter the Building Act as to

effect a reduction in the prime cost of building, as well as an enlargement of the floor area. We venture to predict considerable success for Mr. Spratly's invention.

WOOD PAVING IN LONDON.

The Vestry of Paddington has borrowed £13,000 from the London County Council for the purpose of extending wood pavements in the parish. Already about eight miles of the streets of Paddington are paved with wood, but mostly soft wood. For reasons of durability, cleanliness, and sanitation, the Vestry has now abandoned the use of soft deal in favour of hard wood, and has accepted a tender for the supply of 850,000 West Australian hardwood blocks at £10 17s. 6d. per 1000 blocks.

A GATESHEAD BUILDING DISPUTE.

At the Gateshead County Court, before his Honour Judge Greenwell, an action was brought by Mark Stephenson, builder and contractor, Gateshead, to recover from Jane Ann Turnbull the sum of £25 16s., balance of an account for work done and material supplied. The work done by the plaintiff was the conversion of a dwelling house in Brunswick Street into a shop, such work involving the putting in of a new front, the excavating of a garden, and the laying down of a cement yard. £90 had been paid by the defendant, and this action was for the balance. Plaintiff said he also prepared two sets of plans for the defendant.—Judgment was given for £27 19s.

UNSUCCESSFUL CLAIM AGAINST A BUILDER.

The judge of the Rochester County Court and a special jury on Saturday week investigated a claim for £300 made by a journeyman carpenter named Varrall against his employer, Mr. Charles E. Skinner, a builder, of Chatham, for the loss of four fingers while at work at a circular saw, which the plaintiff alleged was defective.—After hearing evidence the jury returned a verdict for the defendant, being of opinion that the saw was in good condition and that the accident arose through the plaintiff's handling the wood and saw unskillfully.—The Judge said he was glad that by a recent Act of Parliament such cases would be settled by arbitration in future.

PORT TALBOT RAILWAY AND DOCKS.

The new Port Talbot Railway and Docks are now within measureable distance of completion. The new dock, when completed, will be twenty-three acres in extent, and when joined to the old dock—an operation in course of progress—the total water area will be over one hundred acres. Four powerful steam navvies are now employed in the work of excavation in the dock proper. Eight-tenths of this work has now been completed. The entrance-lock is 450ft. long and 60ft. wide, and the walls are up to the coping level, and the gates—the outer ones of iron, working on the ram principle, and the inner ones of greenheart timber—will be erected within the next two months. The north pier, which forms a breakwater of 1500ft. long on one side of the entrance channel, has been carried out to its full length, and is practically completed. This pier is constructed of timber, and will give ample protection from the north-easterly gales. The south pier is of a more substantial character, and is carried out for a distance of 1000ft. from the existing breakwater, which is 1400ft. long. Piles are being driven, and huge blocks of concrete, weighing twenty tons each, are dropped into position on the timber foundation. This work is being rapidly proceeded with, a length of 360ft. having been already completed. The dock is being constructed on the principle adopted at Barry, with sloping sides—protected by copper slag—and projecting timber jetties, on which the coal tips will be erected. The railway is practically finished, with the exception of the junctions with the Great Western Railway at Pontyrril and Margam, and the central passenger station at Port Talbot is also an accomplished fact. The principal contractors are Sir Weetman Pearson and Sons, but it is interesting to

note that two Cardiff firms are also engaged on the work, namely, Messrs. Clark and Co., who are erecting the engine-sheds, and Mr. T. W. Davies, who has constructed the No. 5 Railway, close to Port Talbot.

THE GREAT CENTRAL RAILWAY.

The engineer in charge of the metropolitan section of the Great Central Railway Extension to London has just issued the following report to the chairman and directors of the Company:—"The covered ways and tunnels are now practically completed from Finchley Road to the bridge over the London and North Western Railway. Southwards of that point every effort is being made to urge forward the work. Covered way is progressing at nine and tunnelling at eleven places. Most of the bridges over the railway are completed. The covered way under Lord's Cricket Ground has been duly and punctually finished, in accord-

ance with the agreement with the Marylebone Cricket Club. Active progress is being made with the Grove Road and St. John's Wood Road bridges and with the coal yard. The foundations for the goods warehouse are now nearly all in, and those for the terminal station are in full progress. Contracts have been let for the whole of the buildings and roofing of the terminus station, and the work is being actively carried on. Roads No. 6, extending from Lisson Grove to Park Road, and No. 7, leading into Marylebone Road, are in a forward state. At Neasden 212,000 cubic yards of earth have been tipped upon the site of the sorting sidings, and the necessary bridge and culverts are well in hand. The contract for the locomotive and wagon sheds has been let.

At a meeting of the Whitehaven Town Council the Water Committee submitted a recommendation based on the report of Mr.

Hawkesley, C.E., for an improved water supply for the borough, costing about £10,000. The matter was deferred for further consideration.

THE concession for a railway from Pekin to Hankow has been given by the Chinese Government to a Belgian syndicate. This is the first Great Trunk line in China, and there was keen competition for it on the part of German, British, and American promoters.

SIR JOHN MAPLE has been interviewed on his scheme for the creation of a new Rotten Row in Regent's Park, beginning at York Gate, skirting the Botanic Gardens to the east, passing Gloucester Gate, and running on to York Gate. This would make a ride of about a mile, partly through an existing avenue of trees. Part of the scheme is the erection of a large restaurant near the Row, with provision for dining in the open air. The suggestion is now under consideration by the Chief Commissioner of Works.

CONTRACT OPEN.

BRISTOL WATERWORKS COMPANY. CONTRACT No. 11.

TO CONTRACTORS FOR PIPELAYING.
The Directors of the Bristol Waterworks Company are desirous to receive TENDERS for the LEADING and LAYING (except the jointing) of about five miles of CAST IRON SOCKET PIPES of 30in. diameter. Drawings may be inspected, and specifications and forms of Tender may be obtained at the office of the Company in Small-street, Bristol, and at the office of Messrs. T. and C. HAWKSLEY, Civil Engineers, 30, Great George-street, Westminster, S.W., and Tenders, endorsed "Tenders for Trench Work, &c.", must be delivered at the office of the Company in Bristol, at or before TEN o'clock in the forenoon of SATURDAY, SEPTEMBER 4th next.

The Company do not bind themselves to accept the lowest or any Tender.

By order,
ALFRED J. ALEXANDER,
Secretary and General Manager.
Bristol,
August 13th, 1897.

COMPETITIONS.

CITY of LEEDS.

TO ARCHITECTS.

The Council of the City of Leeds are prepared to receive DESIGNS for a WHOLESALE DEAD MEAT MARKET and ABATTOIR.

A plan of the site, with suggested arrangements, together with instructions to competitors, may be obtained from the City Engineer, Municipal Buildings.

The Corporation offer premiums of £100, £50, and £25.

The Architect whose plans are carried out will be engaged for the work, the premium payable to him in that case to form part of his commission.

Designs (under motto) and with author's name and address, in sealed envelopes) to be delivered not later than OCTOBER 8th next to

JNO. HARRISON,

Town Clerk.

August 6th, 1897.

COUNTY BOROUGH of CARDIFF.

PROPOSED NEW TOWN HALL AND LAW COURTS.

The Corporation invite COMPLETE DESIGNS from Architects for a NEW TOWN HALL and for LAW COURTS, &c.

A list of the conditions of the competition and an epitome of requirements, with a plan of the site, may be obtained upon application to Mr. W. HARPUR, M.I.C.E., Borough Engineer, Town Hall, Cardiff, upon payment of a deposit of £1 ls., which will be returned to all persons who submit a bona-fide design.

A premium of £500 is offered for the designs which may be placed first in order of merit, and further premiums of £300 and £200 respectively for those which are placed second and third in order of merit.

In the selection of the designs the Corporation will be advised by **ALFRED WATERHOUSE, Esq., R.A.**, as Professional Assessor, whose decision will govern the selection of the designs, and be final and binding in all stages of the competition.

Sealed designs (in strict accordance with the conditions and instructions), endorsed "Designs for Town Hall and Law Courts," to be addressed and delivered to

the Borough Engineer, Town Hall, Cardiff, on or before TWELVE (noon), on SATURDAY, DECEMBER 4th, 1897.

By order,

Town Hall, Cardiff, **J. L. WHEATLEY,**
August 4th, 1897. Town Clerk.

LEWISHAM VESTRY.

PUBLIC LIBRARIES COMMITTEE.

TO ARCHITECTS AND OTHERS.

The Vestry invite DESIGNS for the ERECTION of TWO LIBRARIES (with caretakers' rooms) on acquired sites at Lewisham and Forest Hill.

The Buildings to be planned with a view to future extension, and the cost of each building not to exceed £400.

Premiums of 25 Guineas will be paid to the authors of the designs selected for each site, unless the same design is selected for both buildings, in which case one premium only will be paid.

The Vestry will be advised by a professional assessor in the selection of the designs.

Ground plans of the sites and further particulars may be obtained on application.

EDWARD H. OXENHAM,

A Black-and-White Exhibition.

IN no way does the holiday season leave London so desolate as in the matter

of exhibitions of current Art. The summer picture galleries are all closed; their far-off autumn re-opening barely suggested on the portals. The Jubilee has ceased to weary us with the glories and reproaches of Victorian painting. Mr. Meyer's black-and-white gallery in Piccadilly is at the present moment the sole representative of contemporary work; and, happily for the town student at home in August, this quiet little salon well repays the attention which the surrounding barrenness facilitates. Here are displayed some of the best "originals" of Phil May, Oscar Wilson, Manuel, Sime, Eckhardt, Hassall, Dudley Hardy, W. M. P. Nicholson, and other masters of the illustrator's pen. At a first glance, certainly, one is tempted to say that modern illustration—as distinct from decorative black-and-white—reflects only the worst side of contemporary life, and holds the mirror to the mere trappings and trimmings rather than to the essential qualities of the present-day world; concerning itself chiefly with those phases of it by which we should least care to be judged and known. Our journalistic illustrators have not time to do what the great pen-draughtsmen of the sixties did for the magazines of their day—translating into a lighter medium all the exhaustiveness of treatment which one associates (rightly or wrongly) with painting, and making the letterpress a peg for pictures long surviving their occasion. And it would be unfair to look for the permanent elements of idealism in an Art essentially impressionistic in character, and only professing to record fleeting and superficial aspects of the real. It is difficult not to resent, for instance, J. W. T. Manuel's ruthlessly Parisian colouring of English types, but the black-and-white man of to-day can hardly do other than Parisianise an Art to which nearly all that is fresh and vital has been brought from the other side of the Channel. Moreover, such a virile personality as shows itself in Manuel, with his extraordinary gift for what may be called line-painting, will probably emerge unspoiled from such an influence. Of Dudley Hardy it seems hopeless now to expect a similar deliverance. Of the rest, S. H. Sime retains by far the most individual faculty. With a little more dignity and humaneness of method he would have been the Dante of black-and-white; but as they stand, his social satires nauseate, while they amaze us with the ghastly realism of their caricature, and the wizard brilliancy of their draughtmanship. Phil May and Oscar Wilson, Mr. Meyer tells us, share the honours of popularity in the matter of sales. Five or six guineas are often offered for small originals by either of these. The former, of course, has done for coster life on paper what Chevalier has done for it in song. Without any of the tenderness of the genuine humorist—the subtle grace, the dainty charm of a Randolph Caldecott, for example—he manages to seize the salient points of street-comedy with a rough-and-ready smartness and selective power. His line is vigorous and suggestive, but rarely poetic. For this last quality we must turn to the work of an Artist in a widely opposite field—the dreamy, sensuous, harmonious idylls

of Hassall—known better to some of us by his poster designs than by his illustrations. The brilliant portrait studies of T. W. M. Nicholson border closely on the nature of posters, and Mr. Meyer has some fine copies of his much-talked-of wood prints of Sarah Bernhardt, General Roberts, and Her Majesty the Queen. Herbert Railton's delicate and conscientious work appears in some of his romantic "moated-grange" effects, and one would fain have seen more architectural subjects, to which the medium of pen-drawing lends itself so well. One looks in vain for Edgar Wilson; but in fact his place is not here. The next decade will find him with the great decorative draughtsmen, while perhaps the young illustrators here sampled

The Antiquity of Man.

THE meeting of the British Association held in Toronto opened with an address by the President, Sir John Evans, K.C.B.—The President said: It will, perhaps, be expected of me that I should, on the present occasion, bring under review the state of our present knowledge with regard to the antiquity of man; and probably no fitter place could be found for the discussion of such a topic than the adopted home of my venerated friend, the late Sir Daniel Wilson, who first introduced the word "prehistoric" into the English language. Some among us may be able to call to mind the excitement, not only among men of science, but among the general public, when, in 1859, the discoveries of M. Boucher

"YSEULTE." FROM THE ORIGINAL ETCHING BY G. WOOLLISSCROFT REHAD.

will have developed immensely, and in widely various directions. It is interesting to know that the proprietor of this novel Exhibition still finds time to pursue his own work in black-and-white, and to contribute frequently to the illustrated press. The Public little knows how much it is indebted to the Press for bringing to the light artists who, but for the recognition received at the hands of the various weekly and monthly publications, would perhaps struggle on for years comparatively unknown and little cared for in the great human race.

de Perthes and Dr. Rigollot in the gravels of the valley of the Somme, at Abbeville and Amiens, were confirmed by the investigations of the late Sir Joseph Prestwich, myself, and others, and the co-existence of man with the extinct animals of the Quaternary fauna, such as the mammoth and woolly-haired rhinoceros, was first virtually established. It was at the same time pointed out that these relics belonged to a far earlier date than the ordinary stone weapons found upon the surface, which usually showed signs of grinding or polishing, and that, in fact, there were two stone ages in Britain. To these the terms neolithic and

TILE DECORATION. STUDY FOR FALSTAFF. FALSTAFF CLUB, COVENT GARDEN.
BY G. WOOLLISCROFT RHEAD.

palaeolithic were subsequently applied by Sir John Lubbock. Of late years the general tendency of those engaged upon the question of the antiquity of the human race has been in the direction of seeking for evidence by which the existence of man upon the earth could be carried back to a date earlier than that of the Quaternary gravels. There is little doubt that such evidence will eventually be forthcoming; but, judging from all probability, it is not in Northern Europe that the cradle of the human race will eventually be discovered, but in some part of the world more favoured by a tropical climate, where abundant means of subsistence could be procured, and where the necessity for warm clothing did not exist. Before entering into speculations on this subject, or attempting to lay down the limits within which we may safely accept recent discoveries as firmly established, it will be well to glance at some of the cases in which implements are stated to have been found under circumstances which raise a presumption of the existence of man in pre-Glacial, Pliocene, or even

MIocene TIMES.

In an address to the Anthropological Section in 1890 I dealt somewhat fully with the supposed discoveries of the remains of human Art in beds of tertiary date; and I need not here go further into the question. Suffice it to say that I see no reason why the verdict of "not proven," at which I then arrived should be reversed. When we return to Palaeolithic man it is satisfactory to feel that we are treading on comparatively secure ground, and that the discoveries of the last forty years in Britain alone enable us to a great extent to reconstitute his history. We may not know the exact geological period when first he settled in the British area, but we have good evidence that he occupied it at a time when the configuration of the surface was entirely different from what it is at present; when the river valleys had not been cut down to anything like their existing depth, when the fauna of the country was of a totally different character from that of the present day, when the extension of the southern part of the island seaward was in places such that the land was continuous with that of the Continent, and when in all probability a far more rainy climate prevailed. We have proofs of the occupation of the country by man during the long lapse of time that was necessary for the excavation of the river valleys. We have found the old floors on which his habitations were fixed, we have been able to trace him at work on the manufacture of

flint instruments, and by building up, the one upon the other, the flakes struck off by the primeval workman in those remote times, we have been able to reconstruct the blocks of flint which served as his material. That the duration of the Palaeolithic period must have extended over an almost incredible length of time is sufficiently proved by the fact that valleys, some miles in width and of a depth of from 100ft. to 150ft., have been eroded since the deposit of the

EARLIEST IMPLEMENT-BEARING BEDS.

Nor is the apparent duration of this period diminished by the consideration that the floods which hollowed out the valleys were not in all probability of such frequent occurrence as to teach Palaeolithic man by experience the danger of settling too near to the streams, for, had he kept to the higher slopes of the valley, there would have been but little chance of his implements having so constantly formed constituent parts of the gravels deposited by the floods. It must not for a moment be supposed that there are the slightest grounds for believing that the civilisation, such as it was, of the Palaeolithic period originated in the British Isles. We find in other countries implements so identical in form and character with British specimens that they might have been manufactured by the same hands. These occur over large areas in France under similar conditions to those that prevail in England. The same forms have been discovered in the ancient river gravels of Italy, Spain, and Portugal.

ON THE BANKS OF THE NILE.

many hundreds of feet above its present level, implements of the European types have been discovered; while in Somaliland, in an ancient river valley at a great elevation above the sea, Mr. Seton-Karr has collected a large number of implements formed of flint and quartzite, which, judging from their form and character, might have been dug out of the drift deposits of the Somme or the Seine, the Thames or the ancient Solent. In the valley of the Euphrates, implements of the same kind have also been found, and again farther east, in the lateritic deposits of Southern India, they have been obtained in considerable numbers. It is not a little remarkable, and is at the same time highly suggestive, that a form of implement almost peculiar to Madras reappears among implements from the very ancient gravels of the Manzanares at Madrid. In the case of the African discoveries we have as yet no definite

Palaeontological evidence by which to fix their antiquity; but in the Narbadá Valley of Western India, Palaeolithic implements of quartzite seem to be associated with a local fauna of Pleistocene age, comprising, like that of Europe, the elephant, hippopotamus, ox, and other mammals of species now extinct. There seems reason for accepting this Indian Pleistocene fauna as in some degree more ancient than the European. Is this not a case in which the imagination may be fairly invoked in aid of science? In Eastern Asia, in a tropical climate, with the means of subsistence readily at hand, may we not picture to ourselves our earliest ancestors gradually developing from a lowly origin, acquiring a taste for hunting, if not, indeed, being driven to protect themselves from the beasts around them, and evolving the more complicated forms of tools or weapons from the simpler flakes which had previously served them as knives? May we not imagine that, when once the stage of civilisation denoted by these Palaeolithic implements had been reached, the game for the hunter became scarcer, and that his life in consequence assumed a more nomad character? Then, and possibly not till then, may a series of migrations to "fresh woods and pastures new" not unnaturally have ensued, and these following the usual course of "westward towards the setting sun" might eventually lead to a Palaeolithic population finding its way to the extreme borders of Western Europe, where we find such numerous traces of its presence.

AS YET OUR RECORDS

of discoveries in India and Eastern Asia are but scanty; but it is there that the traces of the cradle of the human race are, in my opinion, to be sought. Directly we encounter the relics of the Neolithic period, often separated from the earlier remains by a thick layer of underlying stalagmite, we find flint hatchets polished at the edge and on the surface, cutting at the broad and not at the narrow end, and other forms of implements associated with a fauna in all essential respects identical with that of the present day. Were the makers of these polished weapons the direct descendants of Palaeolithic ancestors, whose occupation of the country was continuous from the days of the old river gravels? or had these long since died out, so that after Western Europe had for ages remained uninhabited, it was repopled in Neolithic times by the immigration of some new race of men? Was there, in fact, a "great gulf fixed" between the two occupations? or was there in Europe a gradual transition from the one stage of culture to the other? It has been said that "what song the Syrens sang, or what name Achilles assumed when he hid himself among women, though puzzling questions, are not beyond all conjecture;" and though the questions now proposed may come under the same category, and must await the discovery of many more essential facts before they receive definite and satisfactory answers, we may, I think, throw some light upon them if we venture to take a few steps upon the seductive if insecure paths of conjecture. So far as I know we have as yet no trustworthy evidence of any transition from the one age to the other, and the gulf between them remains practically unbridged. We can, indeed, hardly name the part of the world in which to seek for the cradle of Neolithic civilisation, though we know that traces of what appear to have been a stone-using people have been discovered in Egypt, and that what must be among the latest of the relics of their industry have been assigned to a date some 3500 to 4000 years before our era. The men of that time had attained to the highest degree of skill in working flint that has ever been reached. Their beautifully made knives and spear-heads seem indicative of a culminating point reached after long ages of experience; but whence these artists in flint came or who they were is at present absolutely unknown, and their handiworks afford no clue to help us in tracing their origin.—The President concluded with an appeal for the establishment of a Government Department of Ethnology.

Men Who Design.

G. WOOLLISCROFT RHEAD.

ON most questions there is something to be said for both sides. That the designer and decorator have in the past been unjustly slighted and barely permitted to call themselves artists is true enough; and it is not in the least to be marvelled at if they feel somewhat sore upon the point. Moreover, it cannot but be a source of satisfaction to all who care for Art, or grasp the conditions necessary for its healthy existence, that the balance has been redressed, and that the unity of the Arts is being better understood. But now that—thanks chiefly to the influence of the Arts and Crafts Society and to the Renaissance of Decorative Art that has grown up with it—the designer has asserted his righteous claim to a recognition of the dignity and importance of his work, is there any harm in asking whether, in the bad old days when the “story-painter” monopolised the name of artist, and the designer was looked upon as a kind of tradesman, the state of the decorative Arts was such that we can point to much really great work, work that will live, produced during that time? Is it not too true that the decorator—though small blame to him, in the narrow conditions in which he found himself—was not able to take that lofty view of his work and of the nobility of its mission by which alone great Art can be produced? Our point is one sometimes overlooked in the consideration of this matter; that, so long as the designer was prevented, from whatever cause, from producing work that was original, dignified, and based on sound artistic principles, it is useless to bemoan the fact that public recognition of his

importance was withheld. The designer who is the subject of this paper, Mr. G. Woolliscroft Rhead, in an article upon “Stained Glass,” written for St. Paul’s, refers incidentally to the fact that an artist to the ordinary public mind is a person who paints pictures, while the mere decorative man is regarded as a sort of upper journeyman, and adds sarcastically: “There is some reason in this view of things. It is undoubtedly possible to invest a picture with artistic merit. Several instances might be mentioned, even in recent times, and on the other hand much of the decorative work done at the present time is merely mechanical stuff.” But then, on the other hand, so is much of the pictorial!

As a man gets a reputation more easily through the pictorial than through any other branch of Art that he may pursue, it is probable that Mr. Rhead is best known to the public—as he was to the present writer—as a member of the Royal Painter Etchers, and more especially as the etcher who engraved the large plates after the works of the late Ford Madox Brown. He is indeed the only man who has interpreted Madox Brown in black-and-white. As an example of Mr. Rhead’s skill with the needle, we reproduce an exceedingly graceful and sympathetic study of a girl’s head—“Yseulte,” one of his original etchings. While we cannot here devote

DESIGN FOR BOOK COVER.

further reference to Mr. Rhead’s pictorial work, either as etcher or painter, we may remark that all his work manifests a fine decorative sense, and a skill in the disposition of mass as well as a feeling for grace of line.

Born in 1855 at Etruria, in the heart of the Staffordshire Potteries, Mr. Rhead has all his life been in touch with the various art crafts. He comes of an artistic stock, for his father was an artist, and, of his brothers, Mr. Louis J. Rhead is well known as a designer of artistic posters, and Mr. Fred. Rhead is one of the cleverest designers now working in the Staffordshire Potteries. Apprenticed first in Etruria, he finished his time in London, where, in 1871, he entered Minton’s Art Pottery Studio in Kensington Gore, then under the direction of Mr. W. S. Coleman. A fire brought the establishment and Mr. Rhead’s employment to an abrupt close, and having won a National Scholarship at South Kensington, he proceeded to study there in the etching room, under Legros, the master who has influenced him most, with the exception of Ford Madox Brown. He next entered the employment of Messrs. Doulton, and while there was responsible for the execution of one of the largest commissions for tiles to be seen in London. To say “to be seen” is not, perhaps, strictly correct. The work was the decoration of the Falstaff Club in Covent Garden, formerly known as Evan’s Supper Rooms. From some cause the club has never been opened, and Mr. Rhead’s work—the designing of a series of large tiles illustrating the adventures of the fat knight—has not had a proper opportunity of inviting public inspection. We reproduce one of his pencil studies for these tiles.

Of the subject of stained glass Mr. Rhead has made a careful study, and I cannot do better than quote some passages from his essay upon the subject already referred to. “The English Renaissance of stained glass is, I believe, mainly due to the efforts and influence of a few men of the so-called pre-Raphaelite School, the majority of whom are still working amongst us*—Dante, Rossetti, Ford Madox Brown, Edward Burne-Jones, and William Morris. Only one of these, Rossetti, was an actual member of the famous brotherhood, but all are Pre-Raphaelite in principle—that is,

* This was written in 1893.

they founded their artistic creed on the earlier and purer forms of the Art; and during the last thirty years or so stained glass has recovered much of its once lost beauty, both as to design and material." After referring to American stained glass in general, and especially to Mr. La Farge's attempt to fuse pieces of glass together to render leads unnecessary, Mr. Rhead remarks: "If there is one thing more than another which is distinctly characteristic of stained glass, it is the lead lines. These should always be insisted upon, and can hardly be too much insisted upon, as nothing strengthens a design more than fearless leading. Burne-Jones is said to have declared that it gives him absolute pleasure to draw a lead line right across a face."

We reproduce Mr. Rhead's cartoons for a window in the private chapel of Lady

Mr. Rhead's work in the design for a book cover, and the illustration for the "Tempest." Both are examples of fine decorative convention, and reveal incidentally that Mr. Rhead has studied closely the decorative value of plant forms.

There remains to mention one more sphere of Mr. Rhead's activities, that of art teaching. As art master of the Borough Polytechnic he has a great opportunity, to which he is fully alive. He has the taste for and knack of teaching, and brings to it an enthusiasm and an interest that should ensure success. He found the school much neglected on the Art side, but has struck out a line of his own that has already made him an influence with his pupils; amongst whom are many lithographers, bookbinders, and others connected with the applied arts, so that his chance of doing good work is a promising one. He makes

LONDON SCHOOL BOARD BUILDINGS.

THE annual report of the Works Committee of the London School Board gives an abstract of the work done during the year ended March 25, and shows the progress made in the provision of accommodation which has been sanctioned by the Board and the Education Department. The committee, over which General Moberly, the vice-chairman of the Board, presides, after stating what had been done in connection with ten sites for new schools and additional land for forty-six existing schools, with regard to which compulsory powers were obtained in 1895-96, report that in the past year it had been decided to schedule twenty sites for new schools and additional land for enlarging twenty-five

ANGELS OF ANNUNCIATION, CRUCIFIXION, AND RESURRECTION. WINDOW FOR LADY DE VESCHI, ABBEY LEIX. BY G. WOOLLISCROFT RHEAD.

De Veschi, Abbey Leix, Queen's co., executed by Messrs. Powell. The figures represent the Angels of the Annunciation, the Crucifixion, and the Resurrection. We also give reproductions of a fine cartoon for a Crucifixion, exhibited at the Academy two years ago but not yet executed; and cartoons for designs representing John the Baptist and St. Andrew, also done for Messrs. Powell. These, even without the colour upon which stained glass so much depends, suffice to show that Mr. Rhead fulfils the conditions he has himself laid down; realising "that a stained glass window is part and parcel of the architecture of a Church, and not a hole in the wall through which a picture may be seen." Even the greatest artists have failed to grasp this radical principle; witness those splendid failures by Sir Joshua Reynolds at Oxford.

We give illustrations of other branches of

it his business to push design, to study and stimulate his students' individuality; dropping as much as possible the old system of teaching Art by "stumping" from the antique.

Mr. Rhead is a staunch and disinterested supporter of the Arts and Crafts Society, for he remarked to me when leaving his pleasant home at Putney, "Even if they reject my work, I shall always stick by them."

THE old iron gate, which bears the date 1728, at the end of the avenue in Gray's Inn Gardens, has just been painted, and the elaborate scroll work picked out in gold.

DURING the past few weeks a completely new peal of bells has been placed in the tower of St. Patrick's Cathedral, Dublin. The bells have been cast at Loughborough, at the works of Messrs. Taylor and Co.

existing schools or playgrounds, or for the purpose of

CARRYING OUT GENERAL IMPROVEMENTS.

In some cases, however, the sites and the land had since been omitted from the schedule. During the year the Board agreed to purchase various interests in sites, at a cost of £116,561, the surveyors' fees amounting to £659. The large amount spent upon sites for school buildings since the Board came into existence will afford some idea of the extent of the provision which has had to be made for the accommodation of the children. The value of all the sites purchased or agreed to be purchased previous to March last was £3,222,412, and the cost £430,621. According to a table prepared by the finance department, the cost of the sites for 325 schools, the accounts for which had been

completed at September 29th, 1896, was £6 11s. 10d. per child, and the average cost per head of the school buildings was £13 14s. 1d., and of the furniture and fittings 10s. 7d. Up to Lady Day, 1896, the total number of permanent schools which had been erected and opened was 409; and during the year under review nine additional schools and fifteen enlargements were opened. The nine new schools were erected—one in Finsbury, one in Greenwich, one in Hackney, one in East Lambeth, two in West Lambeth, one in Southwark, and two in Tower Hamlets.

THE TOTAL ACCOMMODATION PROVIDED

was for 8072 children, and the cost of sites, buildings, and furniture was set down at £237,875 12s. 6d., or an average cost per head of £29 9s. 4d. The enlargements were carried out in Chelsea, Greenwich, Hackney, East Lambeth, West Lambeth, Southwark, and Tower Hamlets. They provided additional accommodation for 4761 children at a cost of £98,787, or an average cost per head of £20 14s. 11d. Loans were authorised by the Education Department in respect of the nine new schools and sites amounting to £239,527, and on account of the fifteen enlargements and sites amounting to £131,202. As to future provision of schools, tenders were accepted during the year for erecting nine new schools—one in Chelsea, two in Finsbury, two in Hackney, two in West Lambeth, one in Marylebone, and one in Westminster—giving accommodation for 9968 children, at a cost of £170,936, or £17 2s. 11d. average cost per head. Tenders were also accepted for eight enlargements—one in Greenwich, one in East Lambeth, one in West Lambeth, two in Southwark, and three in Tower Hamlets—to accommodate 2696 children at a cost of £69,832, or £25 18s. per head. With regard to the new schools it should be stated that each would be provided with a hall for each department, which was not counted in the accommodation of the school, and the tenders included the provision of centres for cookery, laundry, manual training, or special instruction, and in eight cases a drawing class-room. As to the enlargements,

THE VARIATION IN COST

arose mainly from the fact that in enlarging the buildings the opportunity was taken to improve the existing schools so as to make them thoroughly efficient, and in some cases centres were added. Tenders had also been accepted for providing twelve cookery centres, fourteen laundry centres, eighteen manual training centres, seven schools for special instruction, rooms for upper standards at three existing schools, extending a chemical laboratory, providing covered playgrounds at three schools, carrying out drainage and sanitary works to twenty-nine schools, and for other works. The total amount of the tenders for sanitary work at twenty-four of these schools was £32,398. In their last report it was stated that the committee was carefully considering the whole question as to the cost of the schools, and that they had appointed a sub-committee to consider the subject. This committee recommended, with the view of reducing the cost, that, among other things, the Board should revert to the old specification in force in 1885-86 for the next six schools, subject to certain modifications; and the Board had sanctioned the experiment. Among the other works referred to, the committee state that the proposed deaf institution at Anerley, for which a tender had been accepted for £38,920, had been abandoned because the Education Department had

DECLINED TO APPROVE OF THE PLANS.

The industrial school for girls at Isleworth would soon be ready for occupation. Homerton Training College had been purchased and would be used for temporary school accommodation and for the provision of various centres. During the year 132 schools had been painted or cleaned inside or out. The system of carrying out repairs to buildings by workmen employed direct by the Board was being continued in nine of the 18 districts of the clerks of works for repairs, the total number of men so employed

CARTOON FOR ALTAR-PIECE. BY G. WOOLLISCROFT RHEAD.

BY G. WOOLLISCROFT RHEAD.

being 49. On the subject of rates of wages paid by contractors, the report states that in all building contracts a revised clause was now inserted providing that where the London scale of wages applied the contractor should pay to the workmen not less than the rate of wages from time to time mutually agreed upon by the Central Association of Master Builders of London and the representatives of the men's unions, the agreed rate of wages at present recognised being set out in the schedule. In other districts where the London scale of wages did not apply the clause provided that the contractor should pay not less than the minimum standard of wages which might for the time be usual. At Lady Day last the following amount of school accommodation was in course of provision:—

EIGHTEEN SCHOOLS WERE BEING ERECTED, providing accommodation for 19,013 children, and nine enlargements giving accommodation for 3521 children. Thirty-two additional sites for new schools had been or were to be purchased. The schools to be erected on twenty of these sites would provide accommodation for 17,920 children, and in the case of the other twelve the accommodation had not been determined. Ten new sites for schools had been scheduled, and the schools to be erected on five of them would give accommodation for 4185. Twenty-four enlargements had been sanctioned for 8075 children; and the Education Department had also sanctioned the provision of sites, which would be scheduled next session, in five districts.

THE extent of building operations in London is well illustrated by the returns of the great water companies. In July of last year these companies supplied 832,120 houses, while in July of the present year they were supplying 846,646. Thus, within the twelve months there has been an increase of 14,526 separate services, or, to put the matter in another way, there have been built 14,500 houses.

COLOURED GLASS.

BY WILLIAM NORMAN BROWN.

AMONG all the many decorative arts which were employed in the service of the Church in ancient days, not one was more freely employed and at the same time more carefully cultivated than the art of painting on glass. This is not to be wondered at, seeing that it offered peculiar facilities for the teaching and illustrating the story of their faith to the worshippers who thronged the ecclesiastical edifices. Being in windows, it would at once attract attention by means of the rich and varied colours, and in an age when the common herd could not read, the story told by the picture would be understood by the multitude. Hence the popularity and the stability of coloured glass throughout all ages for the embellishment and beautification of places of worship. In windows, prior to the thirteenth century, the prevailing characteristics are a severity of outline combined with a richness of colouring. The treatment was flat, and the effect was gained by placing one colour against another. The effect, however, was very rich, and from the number of small pieces employed, quite kaleidoscopic. The drapery on the figures, together with the faces and hands, were very thickly outlined, which served not only to delineate form but to express shadows. The drawing of the figures, as may readily be imagined, was very stiff and angular, and the clinging draperies of the earlier figures forcibly suggested the lingering influence of Classic Art. The position of the figures was sometimes most quaint, the drawing being very incorrect, though usually bold, vigorous, and expressive. In the long, lancet windows of the Early English period they were frequently divided into medallions with foliated ornament, the groups being defined by cutting the figures out of glass lighter in colour than the background, the

same treatment being adopted in the ornament, where the foliage was generally placed on a dark blue or ruby background. Another way of treating windows was to place a single figure under an architectural canopy, the whole being surmounted with an ornamental border; while another favourite method was the Jesse window, which represented a tree usually growing out of a recumbent figure of Jesse, the father of David, the tree, as it went upward, forming panels by means of the branches, which contained figures representing the genealogy of the Saviour, and which windows were mainly constructed of white glass. The change from the Early English to the Decorated period was a very slow one, following Architecture, the details in which marks the transaction. Nature seems to have offered the Artists their inspiration, and the long-continued conventional foliage gradually assumed more natural shapes, with the result that the ornament of this period is of a far more interesting and varied character than any of its predecessors, while the figures are less angular and stiff, and light and shade began to be employed, the result being of greater richness and softer treatment in the whole work. It was about this time that the means of staining white glass a beautiful yellow became known, the process being effected by means of silver, which was of great advantage to glass painters, opening out quite a new field for them, and white glass was largely employed in figure subjects. In the beginning of the sixteenth century a reddish brown pigment, not unlike burnt sienna, was introduced, it being employed to give a flesh tint to white glass. Prior to this time a coloured glass of a somewhat pink tone had been employed for flesh tints. Later on in the century it was discovered that other colours could be imparted by means of enamels, which, however, is fatal to true glass painting, which, according to an authority, should be where "the design is composed of different pieces of stained glass (i.e., glass coloured in the making) joined together by narrow strips of lead, the main lines of the design being necessarily formed by the lead; whilst the shading and other details were painted in bold lines of opaque dark-brown." It was early in the sixteenth century also that the Art reached its highest development in the matter of technique. At this period the figures were fairly drawn and painted, and pictorial effects were attempted with a very great measure of success, considering the transparent nature of the material; the Flemish artists carrying the Art to the highest pitch in these respects, albeit their beautiful work marked the decadence of the Art, as they overlooked the fact that windows were primarily intended for the admittance of light, and by overloading their designs defeated the object which they ought to have kept in view, the result being that instead of soft-toned windows, our Churches were filled with what were really transparent mural paintings, which led to the deterioration and ultimately the extinction of the manufacture of coloured glass. It was not until the beginning of the present century that the Art revived, and then it proceeded on different lines to that of the thirteenth, fourteenth, fifteenth and sixteenth centuries, the elder Pugin and his school entering with enthusiasm in its revival, though for long they met with but indifferent success.

THE Rev. S. Baring-Gould, the well-known novelist, is about to spend a fortnight in excavating pre-historic villages on Dartmoor.

THE Dean and Chapter of St. Asaph have decided to reconstruct the organ built in 1830 by Messrs. Hill and Company, at a cost of £1200.

THE sixtieth anniversary of the building of the Bishopsgate Chapel is being celebrated by the adoption of a scheme of improvement involving an outlay of fully £1000.

A new sewerage scheme to prevent the flooding of the low-lying portions of the borough when there are heavy rains, has been recommended to the Middlesbrough Corporation by Mr. Mansergh, engineer. The estimated cost is £53,000.

EFFINGHAM HOUSE, ARUNDEL STREET,
September 1st, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

SIR WILLIAM RICHMOND, we learn, has slightly altered his design for the mosaic of the Crucifixion which is to fill one of the quarter-domes in St. Paul's Cathedral. His intention was to represent the figure of Christ crucified to the Tree of Life. It has since been pointed out that there is no authority in ancient manuscripts for representing the Crucifixion as upon the Tree of Life, though the floriated cross is not uncommon, and the Tree of Life does occasionally appear in conjunction with the Crucifixion. Sir Edward Burne-Jones, we believe, was the first to make a design without the cross. In these circumstances, Sir William Richmond has decided to alter his design, and will represent Christ upon the cross with a background of rose trees. This is a symbol for which there is good authority.

THE rapidly-growing popularity of the seaside towns of Norfolk amongst English holiday-makers is leading to extensive building operations at various points along the coastline, and a new watering-place is being developed by a Norwich Syndicate at Walcot and Happisburgh, midway between Yarmouth and Cromer. Walcot and Happisburgh are at present the names of tiny clusters of huts and cottages perched on miniature cliffs, and occupied by labourers and fisherfolk, but at a recent auction sale nearly 200 lots of valuable building land changed hands, realising an aggregate of £1205. The Walcot estate is an elevated plateau, fronted by a beautiful stretch of beach, and the new railway connection with North Walsham promised by the G.E.R. Company will probably insure for it almost immediate prosperity.

IN regard to the Slade Scholarships of Fine Art in University College, London, in connection with the Slade Professorship of Fine Art, Cambridge, established in pursuance of the will of Felix Slade in 1869, the Charity Commissioners have drafted a new scheme, under which, if it should be finally adopted, two scholarships of the annual value of £35 each for proficiency in drawing, painting, and sculpture, or in one or more of those arts, will be offered by the Council of University College for competition in every year. Each scholarship will be tenable for three years. Scholars must be under the age of twenty-one at the date of their election, except in cases specially recommended by the Slade Professor. One clause provides that "If in the opinion of the Council no candidates in any year show sufficient merit, the scholarships shall not be awarded in that year, or if there be only one candidate of sufficient merit, only one scholarship shall be awarded."

ECCLESIASTICAL Dublin is on one side of the Castle, learned Dublin on the other. Both are notable; the latter, perhaps, being more widely known than the former. As regards this Dublin, it is unique, at any rate, among the towns of the United Kingdom. It has two Cathedrals and only one bishop. The most

ancient part of the present structure is very Late Norman and Early English Architecture; but it has been extensively restored, and parts have been rebuilt. Dilapidation rendered this inevitable. The work, begun in 1871, was done at the cost of a munificent citizen, Mr. Henry Roe. St. Patrick's Cathedral is a fine cruciform church, in the pointed style, with a spire which was added in the last century. According to tradition, it occupies the site of a church built by converts on the spot where its Patron Saint had preached. Be this as it may, the Norman archbishop built a church on this spot at the end of the twelfth century. But the present structure is of several dates; for, among other vicissitudes, the Cathedral suffered from a great fire in the earlier part of the seventeenth century. It, too, was becoming dilapidated; but, even earlier than Christ Church, it found a munificent benefactor in Sir Benjamin Guinness, who defrayed the whole cost of restoration.

THE famous ruins on the south side of Virginia Water have recently become unsafe, and a day or two ago the Crown authorities had to take steps to protect the public from harm by dismantling the columns, and only one is now left standing. The ruins, which are visited by thousands annually, are near World's End Gate, and consisted of old Corinthian pillars of Roman origin, disposed (by Sir J. Wyatville) in such a manner as to give the casual observer the idea that they were the remains of some ancient temple formerly standing on the spot. The fact is that they came from Tripoli in 1825, and a Greek inscription on the marble altar informs us that it was dedicated by Publius Aurelius, a servant of Jupiter, to Jupiter Helios, the great Serapis, and to the other gods worshipped in the same temple. Another of the ruins is a tombstone, on which is a Latin inscription to the effect that "Marcus Julius Cethegus, of Philys, erected this to his most beloved wife, Domitia Rogata, who lived twenty-three years." Close by the ruins is the beautiful cascade, constructed in a very natural manner of stones brought from Bagshot Heath, and by the side of the waterfall immense stones are so arranged as to form a cavern, and this is known as the Robbers' Cave. In the summer months George IV., after he came to reside at Windsor, used to spend a great deal of his time at Virginia Water. At that time it was a sealed book to the public, whereby its wonders were exaggerated just in proportion as they were unknown. There were several pleasure boats, and the King used to traverse the lake in a vessel built to resemble an elegant Moorish tent crowned with the crescent. The whole study of George IV. was privacy, as the vast extent of drives projected with that view fully attest. Judge, then, the annoyance experienced by his Majesty when he ascertained that the owner of an allotment standing immediately above Virginia Water had erected an immense tower, from which the movements of himself and the Court might be clearly observed. The tower, from its peculiar shape and construction, was called the "Clock Case," and for some time it formed an insufferable annoyance to the pleasure-loving monarch. After a protracted negotiation, the proprietor was induced to sell it to the Crown "for a consideration," and the "Clock Case" still remains towering high above the lake, but can no longer be used for vexatious purposes.

A CURIOUS conflict is in progress between the Paris Municipality, the State, and the Richelieu family. More than a year ago extensive scaffolding was erected before the Chapel of the Sorbonne, which shelters the tomb of Cardinal Richelieu. The chapel had long been in a bad state of dilapidation, and the Architect of the Sorbonne had decided to have it repaired. The scaffolding is still standing, but the work of restoration has not even been begun. A little late in the day the Architect applied for the necessary funds to the Municipality, who refused them on the ground that the State was responsible for the bill. The State, appealed to in turn, declared that the outlay devolved upon the Municipality, who at last consented to consider the

matter, but only on the understanding that it should be given entire control over the destinies of the chapel. At this juncture the Richelieu family stepped in, and pointed out that Cardinal Richelieu had built the chapel with his own money on the express condition that it should serve for all time as a mausoleum for his house. The family refuses to give up its rights, the Municipality asserts that they have fallen into abeyance, and in the meantime the building is tumbling to pieces behind a scaffolding that seems likely to outlast it.

ASHBURNHAM HOUSE, Dover Street, the residence of the Earl of Ashburnham, has just been disposed of by Messrs. Edwin Davidson and Company, of South Audley Street. The old-time mansion with its lodge and forecourt, was built by Lord Dover in the early part of last century, and gave name to the street in which it is situated. Almost before it was finished, however, it was purchased by the then Earl of Ashburnham, in whose family it has ever since remained. Ashburnham House, though externally somewhat gloomy in appearance, is celebrated for its beautiful interior decorations by Adams, as well as for its splendid collection of pictures and other works of Art, including many rare pieces of *boile* furniture formerly belonging to Marshal Duc de Richelieu. The house was let by George, third Earl of Ashburnham, to the Russian Embassy, which remained there till 1854. It was the residence of the Emperor Nicholas during his visit to the Queen in 1844.

THE inauguration of the monumental fountain erected to the memory of Jules Anspach, Burgomaster of Brussels between 1863-1872, took place last week. The monument, which is highly artistic, consists of a sculptured pediment of white marble, with a bronze medallion and obelisk surmounted by a figure of St. Michael, the Patron Saint of Brussels. It stands on a fine site in the centre of the new boulevards, and is a fitting tribute to the memory of a citizen who was instrumental in effecting a vast scheme of improvement both from a hygienic and architectural point of view.

THE twenty-seventh autumn exhibition at the Walker Art Gallery, Liverpool, now open, ranks high among the provincial displays of the year. The Committee has been fortunate in securing the most prominent pictures shown at the Royal Academy this season, and in addition to these a vast number of very meritorious works have found a place in the galleries. There is a marked absence of the mediocre and indifferent, although here and there canvases are to be met with which have little claim to recognition. Military subjects are strongly represented, and quite a number of large canvases depicting stirring incidents on the battlefield are to be found on the walls. Chief among these is the famous picture "The Roll Call," by Lady Butler, which has been graciously lent by her Majesty the Queen in response to a request by the Art Committee of the Liverpool Corporation. This celebrated work, painted so far back as 1874, has been assigned the place of honour in the Grosvenor Room. Occupying a prominent place in the same room is the recently-painted portrait of Lord Derby, by Mr. Orchardson, R.A., which, whatever its faults in the matter of likeness, is a really splendid bit of work. A picture which will attract much attention is that of Mrs. Meyer and her daughters, painted by Mr. John S. Sargent, which created quite a furore on its first appearance at the Royal Academy this year, and which is regarded by many competent judges as one of the most notable productions of recent years. Another prominent Academy picture which the Committee has been successful in securing is a marine piece entitled, "Pilchards," by Mr. C. Napier Hemy, which has been purchased by the President and Council of the Royal Academy of Arts under the terms of the Chantry Bequest. Sir E. J. Poynter, the President of the Royal Academy, is represented by a small but charming work, and a fine example of the late Sir John Millais also occupies a place in the collection. Other

prominent Academicians who have contributed important pictures are Sir E. Burne-Jones (who sends "Depths of the Sea"), Mr. J. McWhirter, Mr. Waterhouse, Mr. Luke Fildes, and Mr. G. H. Boughton, whose "Vision at the Well" is one of the principal pictures in the Grosvenor Room. Mr. David Murray, A.R.A., sends a delightful picture of Hampstead Heath, and Mr. Colin Hunter, A.R.A., is represented by a fine Scotch scene with a highland river in the foreground, and a purple, heath-clad moor beyond. The Glasgow School is not much in evidence, but one or two of its members have contributed works. Mr. Lavery's Portrait of a Lady is a work of outstanding excellence, and another Glasgow artist, Mr. E. A. Hornell, forwards two very good examples of the peculiar style of Art directed by him. Several Midland artists are represented, these including Mr. Walter Langley and Mr. S. H. Baker.

IMPROVEMENTS are progressing in Fetter Lane, but that street has changed much less than many City thoroughfares. Most of the buildings in Fleet Street have been renewed twice or thrice; but, despite its intensive traffic, Fetter Lane has always been subsidiary to Chancery Lane, and its narrow unloveliness remains, save for the new word Office, almost unredeemed. Nevertheless, it is clear that its day is coming, and it may yet see it a fine and handsome street. Gradually the tributaries, like the great streets themselves, are being transformed. Already much has been done, and the Colonial foreign visitor who has not seen London for five and twenty years, or even less, would be amazed at the change which has been made in its outward aspect. In all that constitutes a "fine city" it has in that time gained enormously, and the capital of the Empire is now in a fair way to become the handsomest, as it already is the most brilliant and amusing, metropolis in the world.

WORKMEN are busily engaged in completing the installation of the electric light at the Houses of Parliament. The scheme has really been in process of development for a dozen years or more. Instead of finishing the work at one time, successive First Commissioners of Works have been content to proceed by instalments. At present unusual activity prevails, owing to the desire to reach something like finality before the retirement of Mr. Prim, the resident engineer in charge of the lighting, warming, and ventilation, under whose auspices the installation began. The House of Lords adopted the new light in its legislative chamber a couple of years ago. But in this matter the House of Commons is more conservative, and still retains gas. Illuminations and ventilation, in fact, are there dependent the one upon the other, the heat generated by the gas jets between the glass ceiling and the roof being utilised in removing the vitiated atmosphere below. Electricity, nevertheless, reigns supreme in the dining rooms, lobbies, and corridors, and its use is gradually extending in the committee rooms. On the Peers' side the Royal Gallery is being treated in a similar manner, and the dining room and grand committee room will be attended to in due time. Throughout the entire building there are no fewer than 5000 lights, and it will be scarcely credited that the electric current is supplied from outside, although it could probably be produced at half the price inside. Not long since it was proposed to substitute electricity for gas in Westminster Hall, but the project was abandoned, it is said, from the notion that the fumes of the older light tended to preserve the huge timbers supporting the ancient roof.

POWERSCOURT HOUSE, the seat of Lord Powerscourt, near Enniskerry, co. Wicklow, which was visited last week by the Duke and Duchess of York, is one of the most beautifully situated residences in the United Kingdom. It was built after the style of an Italian palace by the Italian architects and workmen who visited Ireland in the last decades of the eighteenth century. The terrace on which the

house has been built overlooks a lovely lake. Powerscourt House possesses one of the finest private collections of painting and sculpture, and is noted for a grand salon in which George IV. was entertained on his visit to Ireland in 1821.

THE students attending Professor Gourlay's Architecture and Building Construction classes at the Glasgow and West of Scotland Technical College have been remarkably successful in this year's examinations. All the students presented in Architecture and architectural design passed, two of them taking an excellent, five a first-class, and five a second-class certificate. In honours building construction, four students were admitted to the practical examination in design, held in London, and all passed, James M. Alexander, John M. Arthur, and James S. Boyd taking first classes with bronze medals, while John Smith passed second class. In advanced building construction, sixty-six students were presented, of whom eighteen passed first class and forty-seven second class; while in the elementary stage seventy-one were presented, and none failed; sixty-four take "pass" and seven "fair." In masonry, Archibald Scott took second place in the United Kingdom in the ordinary grade, thereby obtaining the bronze medal of the City and Guilds of London Institute with £1. One other student took a first class in this grade, and two a second class. In the honours grade of masonry three students passed. In carpentry and joinery ten students took first classes, and five second classes in the ordinary grade. In the National competition, the awards for architectural designs executed entirely in the class-rooms and for measured drawings of old work, executed under the superintendence of the professor and his assistants, were the highest yet received by students of this college. They consist of one silver medal, which was won by James M'Kissack; two bronze medals to James Mather and William S. Moyes; two national book prizes to William S. Moyes and Joseph E. Potts; and two prizes for sets of works awarded to William McClelland and Gordon L. Wright.

"A WORSHIPPER OF ST. PAUL'S" writes: "The artist who for some time past has been engaged on the responsible task of decorating with mosaics the interior of St. Paul's has recently permitted his designs for yet further operations to appear, with explanatory notes, in the columns of one of your contemporaries. Consequently it is to be fairly concluded that, by such course, he invites public opinion on his subject. On such ground, his frankness in thus challenging comment at a timely moment, when his work is at the stage of incubation only, must be duly acknowledged. Meanwhile, it may be pertinent at this juncture to ask, on behalf of the public and in the interests of Art, why it is that a building of supreme national importance such as St. Paul's, whose design is so stamped with power, breadth, and repose, expressed in classic Renaissance, is to be further subjected to quasi-medieval mosaics of involved elaboration? In the work accomplished in the choir we have evidence of the method employed by results of confused detail, aggressive glitter, and garish colour, unknown to ancient mosaic work of any style, and in direct opposition to the spirit of Wren's noble achievement. In reference to the 'quarter domes,' so called, at the diagonal points of the 'crossing,' it is shown, in the published evidence referred to, that these are intended to be filled with like treatment of mediæval complexity. They are designed not in true Renaissance character, as duly fulfilled, by Alfred Stevens and G. F. Watts, in the spandrels immediately above as the keynote for mosaic decoration by which to support, and harmonise with, the style and scale of the surrounding Architecture, but, *mirabile dictu*, they are to include a strangely close repetition of the mystically mediæval Crucifixion, designed by Sir Edward Burne Jones for the American Gothic Church at Rome, built by the late George Edmund Street."

"It is to be noted, too," the letter continues,

"that when the sculptured alto-relievo of the Crucifixion, in the new reredos of the Cathedral, raised the Protestant outcry against its alleged symbolical design, the authorities defended the work by proving that the treatment was not symbolical, but strictly historical, in aim simply to represent the scene on Calvary presumably as it occurred. The answer was conclusive. But in the projected mosaics of the quarter domes the Crucifixion is to be treated not historically, but by deliberate intent in mediæval abstruse mysticism! The Saviour is shown with arms outstretched against 'The Tree of Life,' beneath whose uncruciferous, scroll-like, and foliated branches are shown, with other figures, Adam and Eve, accompanied by an extended array of symbolical wheat sheaves. Thus the Cross and the Calvary of history are eliminated in favour of archaic symbolism, nowhere more anachronous than in St. Paul's."

THE historic castle of Carisbrooke has undergone partial restoration, though most of the building is still a block of roofless ruins. The Gate House has now been roofed in and all the rooms of that portion of the castle newly-floored. These are the guard-room, the portcullis chamber with the room above, three rooms in the north-west turret, and the spiral staircase in the south-west turret. No alterations have been made externally to the building, and the original gates, built in 1553, are still subsisting. It is proposed to utilise the rooms newly roofed and renovated for the purpose of storing ancient manuscripts and antiquities connected with the castle and the Isle of Wight. The rooms will be opened in the course of a few days, and admission will be free for one hour daily, a small charge to cover expenses being made at any other time. Excavations have recently been made at the top of the ancient keep, and hammer heads and pike heads, with remnants of domestic utensils, have been found in the ruins at that altitude, showing that in former years the keep itself was used as a dwelling-house.

ONE of the Royal palaces of Henry VIII.—structures not infrequently met with in the older parts of London—situate in Hercules Road, Lambeth, is now in course of renovation, after having been given up for many years to the possession of rats and "spooks"—the latter being vouched for by half the schoolboys of the district. The building is a picturesque one, and, whether ever a Royal residence or not of the Eighth Henry's period, has distinct architectural claims to recognition. It has but barely escaped demolition by the South-Western Railway Company, whose bridge-widening operations are being rapidly pushed in this direction.

FOR some days past Baker Street, Portman Square, has been in a state of chaos owing to the relaying of the wood-paving. The London Hydraulic Power Company has taken the opportunity of laying its mains through Baker Street; therefore it has been necessary to break up the concrete laid a few years ago when wood-paving was introduced. A foot or two below the concrete have been found many old wooden pipes or conduits, made by boring trunks of trees, which were tapered and fitted into each other, and were used for conveying the water. These pipes, at a rough calculation, have been in the ground for over a hundred years, and several were discovered in an excellent condition.

THE discovery at Madaba, in the land of Moab, of a mosaic representing a plan of Palestine in the fifth or sixth century of our era, enables us, according to M. Philippe Berger, to determine the exact site of the Church of the Holy Sepulchre, which was destroyed by the Persians, A.D. 611. This primitive shrine figures in the plan, a description of which is now published. The value of this mosaic in determining the topography of the Holy Land at this period of the Dark Ages is said to consist in the fact that it is no fancy production, but a work of contemporary geography, as the Artist saw it in his time.

SUPPLEMENT.

SEPTEMBER 1ST, 1897.

MODERN SANITATION.

BY H. A. SAUL.

ALTHOUGH the term "Sanitation" implies all that relates to the preservation of health, it is intended in this series of articles to deal only with that portion of the science which has to do with the appliances for the reception, and the means of removal, of refuse from the habitation of man, the medium of conveyance of which is water.

In nothing which forms part of a completed edifice has such rapid evolution taken place as in the methods of draining and the forms of sanitary fittings, an evolution toward greater elaboration as regards pipes and traps, yet one tending to simplicity of principles, if principles can be considered to have existed in the days of curiously curved drains, non-trapping, and non-ventilation; indeed, one is sometimes inclined to think that the only principle recognised was that of "out of sight, out of mind," with a result, it is to be feared, very far from out of smell.

The general principles which govern the modern application of the science are now pretty universally recognised in this country, and the framing of bye-laws and the appointment of sanitary officials by municipal bodies, district councils, and other local authorities, is a happy deterrent to all who would err in sanitary matters, either from ignorance or for the purpose of effecting a false economy. With such precautions one would hardly expect to find an insatiable modern building in the kingdom, but, alas, diphtheria, fevers, and deaths caused by defective drains are still common, though the cases more frequently occur in dwellings of a "jerry" or speculative type, those for which bye-laws—in the suburbs of London at any rate—were particularly intended to apply. Whether such defects are the result of incompetence or want of vigilance on the part of the inspecting authority or on account of his inability to be thorough in districts where houses are being erected rapidly and in large numbers, is not a matter for present consideration, but it points to the necessity of every person about to occupy a residence being quite sure that the drains and fittings are in perfect order. Nor are buildings of this class the only ones upon which it is necessary that such vigilance be bestowed; it behoves all who have the superintendence of drainage work to be ever watchful, for though workmanship may have been specified to be of the best nature, and the employer of labour may be of the best intentions, yet there are still workmen who prefer to do things in the easiest manner, though at the cost of efficiency, and the temptation to "scamp" is great in work which is to be covered up and permanently hidden from sight.

A drain is an underground series of pipes for the purpose of conveying waste liquid matter to a point of disposal, and the drain in relation to a building is that which conveys

PLAN. N^o. 1

the liquid waste from the building to a sewer, cesspool, or collecting chamber in connection with a system of land treatment. Soil is the refuse from water-closets, urinals, slop sinks, &c., and the drain to convey such refuse is the soil drain. Surface-water is that from roofs, yards, and the like, and the drain to convey such water is the surface-water drain. In most of the London districts the soil and surface-water are combined in one system and conveyed by a common pipe to the sewer, but in some districts the soil only is permitted to be discharged into the sewer, and the surface-water has to be kept distinct, and taken by a separate drain into a main surface-water drain which usually runs alongside the sewer; this latter method is known as the *Dual System*.

A drain must be so constructed that no gas may enter into it from the sewer; that no gas or smell may enter the house; and that it has free ventilation from one end to the other. The first and second cases are overcome by means of pipes bent to hold water in such a manner that the upper surface of the bend dips into the water and forms a *seal*; such dipped pipes are called traps, and this system of shutting out sewer gas and smells is known as *trapping* or *intercepting*, and is the first principle of sanitation.

The accompanying plan, No. 1, is the ground-floor of a semi-detached villa, standing upon a 30ft. plot with a narrow side entrance, and the system of drainage is shown in accordance with the first method described above, viz., the combination of soil and surface water, which it is now proposed to consider in detail, leaving the plumbing arrangements to be dealt with in another article.

The drains throughout are 4in. in diameter, of good glazed, stoneware, socketted pipes, laid with a fall of not less than 1in. in 5ft. for soil drains and 1in. in 10ft. for surface water drains; these falls apply to all systems of drainage, and are the minimum; it is advisable to have a greater fall wherever possible. The pipes are placed with their sockets at the upper end, i.e., against the flow, and are laid upon a hard bottom, in this instance assumed to be gravel, but where the earth is loose, sandy or soft, upon a bed of concrete. It will be obvious that a hard bottom is very essential, as otherwise a slight settlement of the ground would cause a drop in the drain and a consequent fracture either of the joint or of the pipe; or if the settlement extended for a considerable distance, a fracture might not occur, but the fall of the drain would be materially interfered with, with the result that an opportunity would occur for the soil to collect in the bottom of the drain and accumulate so as to form a stoppage.

The pipes are connected to one another by means of Portland cement, which is run into the sockets so as to completely fill them, and adheres firmly to the roughened interior of the same, and likewise to the roughened end or spigot of the pipe which rests within the socket. The cement is generally used "neat," i.e., without the admixture of sand, but there seems to be a disadvantage in this method, as drains have frequently been found with cracked sockets, caused by the swelling of the cement, which had been used too new, and as it is very difficult sometimes to ensure the cement being of just the proper age, it is advisable to add a small quantity of very clean and sharp sand, mixed in the proportion of about one half measure of sand to a whole measure of cement.

It will be noticed that all the drains are laid in straight lines; this is an important principle of modern sanitation, and is adopted because the least possible resistance is thus offered to the flow of the matter within the pipes, for facility of inspection, and for ease in removing a stoppage or obstruction. It may appear, at first thought, that such care to obtain straight lines is unnecessary in the case of surface-water drains, as stoppages are very unlikely to occur in pipes intended only for the conveyance of water containing little or no sediment; experience has shown, however, that stoppages in these pipes are of no infrequent occurrence, and as in nearly every instance a little care in planning will enable

drains to be laid direct without difficulty, and with easy means of access for inspection or cleaning, curves should be shunned as clumsy and old-fashioned.

(To be continued.)

IPSWICH WORKHOUSE.

ENTERING or leaving Ipswich by the old turnpike road connecting the borough with the Eastern District of Suffolk, one notices an extensive group of new buildings steadily rising on what was until recently a large field on the town side of Rushmere Heath. The buildings and intervening grounds extend over about three acres. The ground selected is almost level. The soil is sand and gravel. The plan is that of detached or semi-detached blocks. On the right of the principal entrance—that from the Woodbridge Road—stand the vagrant wards. This block is quite isolated from the other buildings. The central portions of the main block of buildings comprise the administrative block—the committee room and offices, the residence of the master, the dining-hall, the kitchen, sculleries, laundry, stores, and serving-rooms. The dining-hall is a spacious, well-lighted room, with stone-mullioned windows and open timbered roof: there is a dado 5ft. high in glazed brick, with an arched opening at one end, at the level of the first floor: this forms a comfortable-looking gallery. Corridors running right and left of the administrative block connect with the two principal wings. Each wing is well supplied with baths and other sanitary requirements. The infirmary constitutes a very special feature of the new buildings. It is reached from the main block by a corridor, from which the visitor enters the central portion of the building. At the foot of the main staircase, corridors to the right and left lead to the infirmary wings. Dormitories and day rooms for both sexes are provided, with accommodation for the medical officer and nurses. The front of the infirmary is to the south, and access to large covered balconies, situate at the level of the first floor, is possible from all the apartments. Flanking the infirmary are somewhat novel structures, known as sanitary towers—very substantial-looking erections, with annexes, by means of which sanitation, according to present day theories, will be thorough and complete. The towers, which are reached from both stories of the infirmary, are all faced on the inside to a height of 4ft. with glazed brick, having a moulded capping, and every one of the angles, both vertical and horizontal, is circular, whether of glazed brick, wood, or plaster, this being done to ensure perfect cleanliness. All through the infirmary every precaution has been taken to meet sanitary requirements. The baths are all of white porcelain, and the lavatories and sinks are of the same material, the patterns chosen being those of appliances most in favour with the highest sanitary authorities. There are several small detached blocks in the grounds of buildings designed for workshops and other auxiliary requirements, a boiler-house, and a mortuary. In the boiler-house will be fixed a large boiler, manufactured by Messrs. E. R. and F. Turner. This will be in close proximity to a large rain-water tank—an excavation capable of storing nearly 70,000 gallons of water, the distribution of which over the building will be effected without difficulty. The drainage will be by means of stoneware pipes, each drain being accessible by means of covered manholes at intervals throughout the system. The sewage will be conveyed to a large tank fixed at an extreme point, and will then be pumped and used on the farm. The buildings are faced externally with red bricks, all provided locally; the inside walls, where not plastered, are faced with bricks from the neighbourhood of Peterborough; the roofs will be covered with Bangor slates. The flooring, where deal is not used, will be of granolithic stone: this portion of the material is being prepared by Mr. Goody, of Colchester, who is also doing the window sills and those for the doors. All the corridors and sanitary towers will be

paved with terazzo. The heating arrangement in the corridors and dining hall is by means of steam pipes; in the day rooms and dormitories open fireplaces, or Shorland's Manchester ventilating grates, will be provided. The contract was for £26,500, or thereabouts, and was taken, after a very close contest, by Messrs. Grimwood and Sons, of Sudbury, and, owing to the dissolution of the partnership, is being carried out by Messrs. Grimwood and Sons, of Ipswich. The plans are by Messrs. Stephen Salter and Adams and Mr. W. Lister Newcombe.

Surveying and Sanitary Notes.

THE sixth annual report upon the sanitary condition of the First or Upper District of the County of Renfrewshire has been prepared and submitted to the County Council and District Committee by Mr. James I. Little, county sanitary inspector. It states that very satisfactory results have been obtained from the work of the staff during the year 1896. Special attention has been given to the sanitary arrangements of new houses, in connection with which 102 drainage systems have been examined and tested. The test has also been applied to 117 old properties which were found to be defective, and all have been renewed or remedied. The inspections made for the recovery of nuisances numbered 11,435, and the number of notices issued as to defects found was 685, of which 671 have been attended to. One special drainage district has been formed and new sewers constructed. In the course of his report, Mr. Little comments on the fact that although a large number of additional houses have been built throughout the district—246 buildings, comprising 501 dwelling-houses, having been erected during the past two years—still the housing of the working classes has not been much improved thereby. In the villages, where the greatest want of houses at a low rent are required, no new buildings have been erected. The want of houses suitable for certain classes prevented the authorities from taking extreme measures.

MANCHESTER'S difficulty in the treatment of its sewage was again a subject of discussion at the last meeting of the Mersey and Irwell Joint Committee. A further extension of time was asked for on behalf of the Corporation. The position of the Corporation was described by Mr. Alderman M'Dougall, who said that a scheme of artificial filtration dealing with the entire sewage of the city would cost, according to an estimate of the city surveyor, no less a sum than £275,000, and the filters would need renewal every three years, at a further cost of £120,000. These figures were so alarming that some members of the Committee were disposed to revert to the culvert scheme. For the same capital expenditure they could take the effluent altogether away from the neighbourhood.—The Committee decided to give the Corporation a further period of three months in which to prepare a scheme.

COLONEL DURNFORD, on behalf of the Local Government Board, recently held a public inquiry at the Church Schools, Castleton, into the application of the Rural District Council of Chapel-en-le-Frith to borrow £2000 for the purposes of carrying out works of sewerage and sewage disposal for Castleton. Some time ago a scheme was prepared, the estimated cost of which was £3000, but it was thought this would be too expensive for so small a place, and eventually an alternative scheme was prepared, estimated to cost £2000, which was adopted by the District Council, and an application was made to borrow the amount. But it was expected that £2200 would have to be asked for, owing to the land costing £400 instead of £200. Other evidence having been taken, the inquiry closed, and the inspector, with others, visited the site of the proposed outfall works.

THE Borough Surveyor of Blackpool has submitted to the members of the Council his scheme for widening the Promenade—an improvement that has now been talked of for some years. He shows that the present Promenade varies in width from 24ft. to 70ft., and the footpath from 5ft. to 17ft. The scheme, which will probably be put before Parliament for sanction, provides for a footpath 10ft. wide on the east side next the houses, a carriage way 55ft., an island footpath

10ft. wide, a raised track for a double line of trams the whole length of the Promenade 20ft. 9in. wide, and then the Promenade footpath, with a uniform width of 42ft., faced at the side by a sloping hulking of 15in. granite setts. The sea wall will be exactly like that on the North Shore works, and will run on the same level till it meets the new Promenade opposite the south end of the Tower, where it will join the upper one. The concrete of which it will be constructed will be 7ft. thick,

and faced above the granite hulking with concrete blocks and coping. The estimates state that the cost of the section from the south end to the Manchester Hotel will be £117,896; the second section, from the Manchester Hotel to the Royal Hotel, £98,661; and the third section, as far as the North Shore Promenade, £132,424; a total cost of a little under £350,000. The scheme has already been considered by the Council, and awaits final decision.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Sept. 3	Batley—Villas at Wilton Park	Guardians	W. Hanstock, Architect, Branch-road, Batley.
" 3	Bridlington—Offices at Workhouse	Rural District Council	S. Dyer, Architect, Bridlington Quay.
" 3	Christchurch, Hants.—Isolation Hospital	Harbour Trustees	A. Druiit, Clerk to Council, High-street, Christchurch.
" 3	Dundee—Six Iron Sheds	Paragon Ironworks	G. C. Buchanan, Engineer, Harbour-chambers, Dundee.
" 3	Halifax—Extension of Store Room and Foundry	Industrial Co-operative Society	A. G. Dalzell, 15, Commercial-street, Halifax.
" 4	Briton Ferry, Glamorgan—Seven Dwelling Houses		H. A. Clarke, Architect, Briton Ferry.
" 4	Chippenham—Cottage Hospital		F. H. Phillips, Town Clerk, Chippenham.
" 4	Halifax—Stabling, Coach House, &c., Savile Park		S. Wilkinson, Architect, Sowerby Bridge.
" 4	Leith, Scotland—Public Baths	Corporation	—Simpson, Architect, Town Hall.
" 4	Sheffield—Alterations, &c., to Workhouse, Fivale	Guardians	C. J. Innocent, 17, George-street, Sheffield.
" 4	Armagh—Alterations to County Infirmary	R. Phillips	J. C. Boyle, C.E., The Mall, Armagh.
" 4	Penzance—Villa, Marazion	War Department	O. Caldwell, Architect, Penzance.
" 5	Sandhurst, Berks.—Canteen, &c.	Glamorgan County Council	Royal Engineer Office, North Aldershot.
" 6	Barry, Cardiff—Alterations, &c., to Intermediate School	Committee of Visitors	County Police Station, Barry Dock.
" 6	Brentwood, Essex—Boller House	School Board	W. Gepp, Clerk to Committee, Chelmsford.
" 6	Coventry—Enlargement of School	School Board	T. F. Tickner, Bishop-street, Coventry.
" 6	Gateshead—Board School		Oliver and Leeson, Architects, Mosley-street, Newcastle.
" 6	Keighley—Church and Schools		W. H. and A. Sugden, Architects, Cavendish-st., Keighley.
" 6	Leicester—Class Rooms, &c., Ripley Hospital		Austin and Paley, Architects, Lancaster.
" 6	Mytholmroyd, Yorks.—Vicarage		Jackson and Fox, 22, George-street, Halifax.
" 6	Roths, Scotland—Addition to Seafield Arms Hotel		R. B. Pratt, Architect, County Bank House, Elgin.
Sept. 6	Keighley—St. Barnabas' Church and Schools, Twaites Brow		W. H. and A. Sugden, Architects, Cavendish-street, Keighley.
" 6	Hebburn—Shedding, &c., Argyle-street	Urban District Council	Surveyor's Office, Argyle-street, Hebburn.
" 7	Birmingham—Restoration of St. Michael's Church, Brierley Hill	Rector and Churchwardens	Cossins, Peacock, and Bewley, 83, Colmore-row, Birmingham.
" 7	Bolton—Inland Revenue Office	H.M. Commissioners of Works	Hon. R. B. Brett, Secretary, 12, Whitehall-place, S.W.
" 7	Gravesend—Police Cells, &c.	Corporation	Borough Surveyor, Town Hall, Gravesend.
" 7	Highgate Hill, N.—Workhouse Infirmary	Islington Board of Guardians	E. Davey, St. John's-road, Upper Holloway.
" 7	Hampton—Workshop, &c.	Urban District Council	Council's Offices, Hampton.
" 7	Nelson, Lancs.—Walverden Board School	School Board	T. Bell, 14, Grimshawe-street, Burnley.
" 7	Stroud—Chimney Stack, &c.	Guardians	Guardians' Offices, John-street, Stroud.
" 8	Birmingham—Cottages (2) and Laundry, Marston Green Cottage Homes	Guardians	C. Whitwell, Architect, Cannon-street, Birmingham.
" 8	Rotherhithe, S.E.—Shelter at South Wharf	Metropolitan Asylums Board	T. Duncombe Mann, Clerk, Norfolk-street, Strand, W.C.
" 8	Perth—Stables	Police Commissioners	R. M. Killop, Borough Surveyor, 12, Tay-street, Perth.
" 9	Felling—Re-building Brindling Hotel		H. Miller, Architect, Felling.
" 11	Llanfihangel-y-Creuddyn—Restoration of Church Tower	Restoration Committee	J. P. Evans, Vicarage, Llanfihangel-y-Creuddyn.
" 13	Camberwell, S.E.—Railing and Gates	Vestry	O. S. Brown, Vestry Hall, Camberwell.
" 13	East Preston, Sussex—Bricklayer and Plumbers' Work	Workhouse Guardians	H. Howard, Town Offices, Littlehampton.
" 13	Nailsworth—Church, &c.		Vale and Kingsford, Surveyors, Gloucester.
" 13	Carlisle—Teachers' Rooms, &c., Caldewgate Schools	School Board	Johnstone Brothers, 39, Lowther-street, Carlisle.
" 13	Folkestone—Fifty Artisans' Dwellings	Corporation	Borough Engineer, 29, Dover-road, Folkestone.
" 14	Halifax—Confectionery Works		M. Hall, 29, Northgate, Halifax.
" 14	Shibden, near Halifax—School at Salterlee	Ffaldan Collieries Company	J. F. Walsh, Lanes. & Yorkshire Bank-chambers, Halifax.
" 15	Pontycymer, Wales—Forty-five Cottages	School Board	Colliery Offices, Pontycymer.
" 16	Falmouth—Schools, Alterations, &c.	Committee	W. Jenkins, Clerk, Falmouth.
" 18	Wadsley, Yorks.—Wash-house, Engine-room, &c.	Infirmary Committee and Guardians	—Cotterill, Wadsley Asylum, Sheffield.
" 20	Warrington—Infirmary Buildings	Lancashire Asylum Board	W. Owen, Cairo-street-chambers, Warrington.
" 20	Winwick—Asylum	Urban District Council	J. Beaman, Delf Farm House, Winwick, near Warrington.
" 21	Llandudno—Electric Lighting and Refuse Destructor Buildings		E. P. Stephenson, Council Offices, Llandudno.
" 21	London—Erection of Camp Sheathing	Commissioners of Sewers	Guildhall, E.C.
" 21	Northwram, near Halifax—Residence		J. T. Walsh, Lanes. and Yorks. Bank-chambers, Halifax.
No Date.	Ashton-under-Lyne—Doctor's Residence		J. Eaton, Sons, & Cantrell, Stamford-st., Ashton-under-Lyne.
"	Belfast—Public Laundry, The Abbey	New Granville Hotel Company, Limited	W. J. Fennell, Architect, Chichester-street.
"	Buxton—Retaining Wall	Urban District Council	Garlick and Flint, Architects, Buxton.
"	Canklon, near Rotherham—Mission Church		E. J. Hubbard, Architect, Moorgate-street, Rotherham.
"	Chesterfield—Two Cottages		F. T. Skelton, North-road, Clown, Chesterfield.
"	Church Gresley—Wesleyan Chapel		E. C. Clarke, Prudential-buildings, Nottingham.
"	Clara Vale, near Ryton—Store and Pair of Cottages	Blayton-on-Tyne Co-operative Society	Liddle and Brown, Prudential-buildings, Newcastle.
"	Colchester—Additions to the "Cannons"		C. E. Butcher, 3, Queen-street, Colchester.
"	Colchester—House, Beaconsfield-road	E. Hennemeyer	C. E. Butcher, 3, Queen-street, Colchester.
"	Derby—Converting Seven Houses		Coulthurst and Booty, 4, Albert-street, Derby.
"	Dover—Alterations, &c., to Hospital Ward		Fry and Gardener, Cannon-street, Dover.

"	London, S.E.—Two Libraries	£25 each	Lewisham Vestry.

DEMOLITION OF OLD BIRMINGHAM.

ANOTHER link in the chain which binds old and new Birmingham together is about to be snapped by the demolition of the extensive block of premises forming the lower part of Cannon Street and Needless Alley, together with the three shops between the two thoroughfares in New Street. This property is one of the most ancient pieces of old Birmingham existing in the centre of the city. The low-roofed, old-fashioned buildings, with the shop fronts brought up to the street line, are in strange contrast with the modern commercial houses on either side; and their replacement by handsome shops, erected on the most modern principles, will be "a conspicuous improvement" to New Street. The property which is now about to be razed to the ground has a frontage to New Street of 66ft., to Needless Alley of 164ft., and to Cannon Street of 144ft. It is cut off from the remaining buildings by a line which preserves the existence of the premises of Messrs. Frank Smith and Wilson, in Cannon Street, and continues through to Needless Alley. This forms an oblong piece of land which generations ago was part of the old Cherry Orchard. In the early days of the eighteenth century two houses stood upon the site. They were built by one William Guest, and in 1729 were in the occupation of William Weeley and Thomas Abell. Attached to them was a close, known as Hipkins's, and there were also four little gardens, two evidently in front, because, according to the old maps and plans, these houses were some little distance removed from the main street. The Clarence Property Company, Limited, proposed to demolish the block, and to erect several imposing shops, together with offices, &c., at a total cost of at least £20,000. It is expected that the new pile of buildings will be completed by the autumn of 1898. One wonders that advantage should not be taken by the authorities to have Cannon Street widened now that the structural alterations are to be carried out, but the Public Works Committee has not interfered in the matter. The building line in Cannon Street and Needless Alley is at present very irregular, and arrangements have been made to make that line as straight as circumstances will permit. In order to do this the Corporation will give up eight yards of land, and the Company will sacrifice eighteen yards. This will be the means of effecting a considerable modification and improvement in the street line, and though it will not extend the width of the roadway it will enlarge the width of the pavement from a few inches to two feet at the narrowest point. The new buildings will be erected in accordance with the plans of Messrs. Essex, Nicoll, and Goodman, Architects, Newhall Street. Provision is made for four shops fronting New Street, to occupy the space of the three original buildings. They will extend to about half the depth of the site—namely, 80ft.; so that, although the shops will be narrower than those now existing, they will be longer and will allow of a greater amount of floor space at the rear. The shops are to include the ground floor, a mezzanine floor, interposed in consequence of the considerable rise of the land up Cannon Street, and first, second, and third stories, the central portion over the two middle shops being continued as an extra story to form an ornamental gable. In Cannon Street there will also be room for four shops about 70ft. in length, and running through to Needless Alley, but so arranged as to be capable of subdivision, and the portions with frontages to Needless Alley let independently if necessary. Over the shops will be built three floors, which, together with the upper stories in New Street, will be let for professional and other offices, and approached from a staircase entrance in Cannon Street. The basements, access to which may also be obtained from Cannon Street, are to be so arranged that they, too, may be let apart from the shops. The general style of the design is a free Renaissance, and the treatment will be of an ornate character.

ABERDEEN WATERWORKS.

THE inspection of the new waterworks for Culter by the Aberdeen District Committee marks the completion of a scheme that provides the village of Culter and the neighbourhood with water and drainage of a very superior description. The pumping station is a building partly formed of concrete and partly of galvanised iron. In it have been placed two vortex turbines of four horse-power each to actuate two 5in. pumps capable of forcing up to the high level tank on Tillyvach Farm 130,000 gallons of water per day. Besides the pumping station proper there is adjoining it on this site a storage cistern capable of holding about 70,000 gallons of spring water. From the high level tank the water gravitates to a service reservoir on the hill at Culter, near Bucklerburn Farm, which is also capable of holding about 70,000 gallons. A screening chamber is provided, fitted with very fine wire gauze; and it may be noted that a ball-cock is placed at the end of the delivery pipe in the Bucklerburn reservoir, so that when the reservoir is full the water does not flow past the screening chamber, in which there is a 3in. pipe for the conveyance of the surplus water direct to the Culter mills for paper-making purposes. The service reservoir is constructed entirely of concrete; that portion which is above ground represents ashlar stone, and the whole is covered with a pavilion roof clad with blue slates. The capacity of this reservoir, 70,000 gallons, is equal to about two and a half days' supply for the population of the Culter district at the rate of twenty-five gallons per day per head. From the service reservoir, which is a conspicuous and pleasing feature on the hillside, the water enters the distributing mains for the supply of those within the special district. The pressure from the reservoir is so great that at two points reducing valves have had to be put in in order to relieve the ordinary service pipes. The drainage scheme consists in laying sewers throughout the district. The sewers are provided with manholes, flush tanks, and ventilation openings, all of modern construction, and the sewage matter is conveyed to the low ground below Culter railway station, and there treated by mechanical precipitation. This reservoir is now completed. It is situated on the margin of several farms near Wester Ord, and covering an area of about eight acres, contains about eight million gallons of water. The result of the works in this connection has been to convert a large portion of utterly waste land into a beautiful sheet of water, which has now become the special feature of that neighbourhood. The scheme has been carried out for the Aberdeen District Committee by Mr. John D. Watson, C.E., county engineer. The various contractors were:—George Mackay and Sons, Stirling, for the main portion of the works; Millar and Son, Annan, for the turbines, pumps, and other apparatus; Donald Cruickshank, Culter, for the Wester Ord reservoir, pipes, &c.; Charles Smith, Culter, for the lade at the pumping station, fences, &c.; Blaikie and Sons, Aberdeen, for a ram to supply one of the farms near the springs with compensation water.

AN arch is to be erected at the entrance to Balmoral Castle to mark the occasion of the Queen's first visit to her Highland home after the Diamond Jubilee celebrations.

At a cost of nearly £17,000 a large house with stables is about to be erected at No. 14, Avenue-road, N.W., according to the designs of Messrs. H. H. and M. E. Collins, Architects, 61, Old Broad Street.

THE well-known and very sombre-looking Roman Catholic Church known as St. Mary's, Moorfields, is needing considerable repair. The vaults are now so weakened by age that they have to be supported by timber props.

A STATUE of the Archangel trampling on the Dragon has been placed on the pinnacle of the Church of Mont St. Michel, Paris. A similar statue existed till the Revolution, when a semaphore signal took its place, but this has long disappeared.

Professional Items.

BRECHIN.—The memorial stone of the new Established Church was laid by Mr. James A. Campbell of Stracathro, M.P., last week. The Church is placed alongside Damacre Road at right angles to St. Ninian's Square, facing which the hall, session-house, and vestry are extended. A massive square tower at their intersection serves at once as a fitting termination to the lower end of the monastic-looking buildings facing the Square, and to the higher and plainer side elevation of the Church to Damacre Road. No attempt has been made to render the buildings rich or ornate. Their scheme is simple and direct, based on the necessities of modern Church work, and they are carried out in the style and with that breadth of fulness of detail which characterise the best of the Scottish Abbeys. The Church consists of a nave 99ft. long by 24ft. wide, seated for 305, and an aisle 72ft. long by 20½ft. wide, seated for 208. At the end of the nave the floor is raised for the Communion table, pulpit, and choir, a stone parapet wall dividing their position from the organ end of the aisle, but beyond a slightly richer treatment of the stonework of the windows and of the woodwork of the roof there is nothing to break the full length of the nave. At the tower end of the Church, and within the walls of the tower, there is a gallery to seat 87, which is reached by the vestibule, which occupies the whole breadth of the aisle, and communicates at once with the open porch, the entrance to which forms the main feature of the St. Ninian's Square front. The hall is 46ft. long by 20½ft. wide, and is seated for 162. The session-house is 21½ft. long by 18ft. wide. The whole buildings are constructed of native grey rubble, with red Corncockle freestone dressings, the stonework of the interior being wholly of red stone. The following are the contractors: Masons—Messrs. R. Aitkenhead and Sons, High Blantyre, Lanarkshire; joiners—Messrs. Herbertson and Sons, Glasgow; plasterer—Mr. J. Gibson, Brechin; slater—Mr. J. Scott, Brechin; plumbers and gasfitters—Messrs. Kinnear and Son, Brechin; and heating and ventilating engineers—Messrs. J. Cormack and Sons, Glasgow. The sculptor for stone carving is Mr. William Vickers, of Glasgow; Messrs. Douglas, Hunter, and Whitson, of Glasgow, are the measurers. Mr. James Kennedy is the visiting clerk of works, and Mr. James Cumming Wynnes is the resident draughtsman and inspector. The Architect is Mr. John James Burnet, of Messrs. J. Burnet and Son, Glasgow.

BRIGG (LINCOLNSHIRE).—The old Angel Hotel, which has stood some centuries, has undergone demolition and rebuilding as shown in our illustration. The new premises comprise commercial and coffee rooms, carriage entrance to the covered courtyard, and buildings in the rear, sitting and bed rooms, with a central balcony on the first floor. The style adopted is half timber work overhanging the ground story. The ceiling timbers are in view, the windows and door panels are glazed with leaded glass, and all the internal fittings are of suitable character, harmonising with the style of the buildings. The work has been carried out by Mr. H. Dent, from the designs and under the superintendence of Messrs. Freeman, Son, and Gaskell, Architects, of Hull.

COLCHESTER.—In our last issue the second premiated design in the Town Hall competition was attributed to Messrs. Lanchester, Stewart, and Rickards; this should, of course, have been Messrs. Brown, May and Rickards.

DENHOLME.—The foundation-stones of a new Wesleyan Sunday school at Denholme were laid a day or two ago. The new school, which will stand on a plot of ground adjoining the chapel, supersedes the building erected in 1836. The new building will, it is estimated, cost about £2200. The school has been designed by Messrs. Judson and Moore, Architects, of Oakworth, and it will agree in architectural style with the adjoining chapel.

The contracts have been let to the following:—Mason's work, Messrs. Sunderland and Greenwood, Lees; joiner's work, Mr. Joseph Hartley, Oakworth; plumbing, Messrs. Bennett, Denholme; plastering, Mr. F. Shaw, Denholme; and slater's work, Mr. Thomas Nelson, Bradford.

DRAUGHTON, NEAR SKIPTON.—The foundation stone of a new Church at Draughton, near Skipton, was formally laid last week by the Duchess of Devonshire. The new Church, which will occupy a site in the centre of the village, is estimated to cost £450, towards which £225 has been paid or promised. The Church has been designed by Mr. B. Emmott, of Addingham, in the Gothic style of Architecture, and will provide accommodation for 100.

DUNDEE.—A meeting in connection with the establishment of an incurables' hospital in Dundee in commemoration of the Queen's long reign was held last week, when it was stated that £43,000 of the £50,000 which they aimed at had been obtained. It was resolved to appoint a committee to look out for a site, and to inquire as to the probable cost.

FELIXSTOWE.—The design by Mr. Brightwen Binyon, of Ipswich, recently selected in competition for laying out about 800ft. frontage of the cliffs and grounds beneath the existing public gardens at Felixstowe, provides for a central building, containing billiard, refreshment, and cloak rooms, over which is a concert hall, or winter garden, 86ft. by 55ft., with reading, smoking, and dining rooms, facing the sea, and opening on to a promenade along the front of the site, under which are arranged beach-houses, that will take the place of the present unsightly bathing-huts. The concert hall is near the new central railway station, now in course of construction, with loop lines of access, by the Great Eastern Railway Company. This hall is lighted principally from the top by a glass pavilion roof, having a promenade round, with a bandstand and wind shelters to the front. The buildings and grounds are entered from the beach in the centre, and also from the cliff gardens. The grounds have been divided into three, and the building is so arranged that it can be carried out in sections:—The first, the centre portion, containing the concert hall and beach huts; the second, the portion to the west of the existing zigzag steps and path, containing the spa and baths, and also a continuation of the promenade; and the third portion consisting of a continuation of the promenade to the east, as far as the end of the site. The design has been arranged with the view to the subsequent building of a pier, starting from the level of the promenade at the centre of the range of buildings, and the grounds are laid out with paths and tennis courts, with summer huts and seats at intervals.

GRIMSBY.—A new and commodious school building is in course of erection in Strand Street. The school is being built on somewhat the same method as the Board Schools, the work being carried out by Mr. Hewins, while the Architect is Mr. F. Skelton.

LEEDS.—Plans have been prepared for the erection of a Nurses' Home to provide accommodation for fifty of the nurses now employed in the Leeds and District General Infirmary, and in the course of a few weeks building operations are to be commenced. The site selected forms a portion of the land recently acquired by the Infirmary Board, known as Sunny Bank, situated on the north-west side of the institution. The recent increase in the staff brought the committee face to face with the question of how the new nurses were to be housed. In the existing home there is only accommodation for about fifty, and as there are now nearly double that number of nurses, temporary provision has had to be made for the remainder in various parts of the institution. With a donation of £5000, Mr. James Stables came to the help of the board a couple of years ago, and now this sum, and maybe a little more, is to be expended on providing for genuine accommodation for all the nurses in

the institution. Another improvement which is being carried out at the infirmary, and one which may in the near future approach completion, is the erection of two new modern operating theatres, with instrument-room, anæsthetic-rooms, recovery-rooms, and all other necessary adjuncts. Between £4000 and £5000 is being spent in this new department. The walls of the operating theatres are lined with opaline.

LLANDUDNO.—A scheme which will assist materially in the development of the eastern portion of the town has just received the sanction of the Board of Trade. This is the construction of a new pier and pavilion opposite Riviere's Concert Hall, in the centre of the bay, at a cost of £50,000. The pier will be 12,000ft. long and 40ft. wide, and the pavilion is to be sufficiently large to provide sitting accommodation for 4000 persons. The work will be commenced about the end of September.

LLANELLY.—At a special meeting of the Llanelly Borough Council, the Surveyor submitted plans and estimates for raising the sea embankment. It was reported that the cost would be £4000. It was decided that the work be done, and that the Local Government

of Idle. The work has been commenced, and is being carried out, from the designs and under the superintendence of Mr. William Bakewell, Architect, Leeds.

NEWPORT.—The directors of the infirmary have just decided as to the tenders for the new hospital. They have selected the lowest tender, which is that by the local firm of Messrs. A. S. Morgan and Company, Godfrey Road, Newport. This firm's tender amounts to £29,950, as against £20,600, the Architect's estimate. It is, however, accepted, subject to certain modifications, which will reduce it considerably. The cost of the new buildings and furnishing will thus, in all probability, exceed the £25,000 which the directors have estimated as the sum needed. The following is a list of the firms who tendered:—A. S. Morgan and Company, Newport, £29,950; T. Westacott, Newport, £29,991 17s.; D. J. Davies and Jones, Newport, £30,097; John Linton, Newport, £30,850; Hy. Parfitt and Dyson, Newport, £31,000; Wm. Bowers and Company, Hereford, £31,940; Samuel Warburton, Manchester, £32,314; W. A. Blackburn, Newport, £32,425; W. Gradwell and Company, Limited, Barrow-in-Furness, £32,572 13s. 5d.; W. A. Linton, Newport,

ANGEL HOTEL, BRIGG. MESSRS. FREEMAN, SON, AND GASKELL, ARCHITECTS.

Board be asked to sanction the borrowing of the money.

LONDON, S.E.—Of a total estimated cost of £10,000, £3000 has already been subscribed towards the Murphy Memorial Hall. The building, which is to seat 1000 persons, will be constructed of red brick, with bands and copings of stone. It will have a frontage in the New Kent Road of 34ft., and a return frontage of 112ft. in Gurney Street. Vestries and class-rooms will be provided to meet the requirements of many societies. To erect the new hall and alter the present hall for school purposes £6000 is required. Other items, making up the estimated total of £10,000, are:—Freehold land, £2550; purchase of present hall, £1000; and furniture and incidental expenses, £450.

MILLBAY.—The pile of buildings erected from designs by Mr. Snell, of Plymouth, in the Millbay Road for the Millbay Laundry, Cleaning, and Dyeing Company, overlooks the Millbay Docks. The whole of the rooms for the conduct of the various branches of the work are designed and built with a view to the carrying on the business of washing and dyeing on the most modern and improved lines.

MORLEY.—The contract for the new premises of the London and Yorkshire Bank at Morley has been let to Messrs. Murgatroyd, builders,

£32,575; W. J. Bloxham, Banbury, £33,660; Chas. H. Reed, Newport, £34,110; Henry Wilcock, Wolverhampton, £34,250.

SCARBOROUGH.—The Buildings Committee of the Corporation has passed plans for erecting in the grounds of the Castle-by-the-sea, hitherto a private residence on one of the highest points of north cliff, a revolving tower similar to one recently constructed at Yarmouth. The tower will be 120ft. high and 15ft. in diameter, and the house will be converted into a café.

SHEFFIELD.—The committee which is making the arrangements with regard to the Duke of Norfolk's statue has received a letter from Mr. Onslow Ford, R.A., accepting the commission. He proposes to make the statue a life-size sitting figure, and it is to be placed on a pedestal which will harmonise in colouring with the other marbles used in the grand staircase of the new Town Hall. The statue is to be placed there; and as at present arranged, it will be situated so as to be readily seen by the public as they enter the building to pay their rates. So far as the position of the statue, and the choice of the materials for its pedestal, are concerned, Mr. Onslow Ford will take Mr. Mountford, the Architect of the building, into consultation, in order that the unity of the Architectural scheme of the building may not be impaired. For the statue itself, Mr. Onslow Ford will be solely responsible.

Enquiry Department.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you kindly inform me whether there is a book dealing with English examples of Gothic Architecture exclusively, and price? While writing to you may I reiterate the wish of some of your correspondents for a Students' Column? I feel sure it would greatly increase the popularity of your splendid journal as well as being a great assistance to your younger contributors.—Yours faithfully,

A. C. R.

There is no really reliable book on English Architecture exclusively. The best is "Ancient Architecture of England," by Carter, and we understand Mr. B. T. Batsford, of 94, High Holborn, has a first-edition copy revised by Britton, half bound in morocco, 1845, with 109 engravings, second hand, which can be purchased for 30s., although published at six guineas. Parker's Glossary is a very useful summary, so is Bloxham's. Ferguson's small book on the Development of Architecture is useful as giving a general idea of the whole. But, speaking broadly, it is no more possible to learn about Architecture from books than it would be to study the Art of painting from line engraving. Architecture is an Art so complex, so dependent on site, situation, and, above all, on material, that no treatise can give any idea of the multiplicity of causes which result in any one effect. The careful study of one building, if carried out with the help of authenticated dates, will teach more about the subject than many books. Take any good building—and no district in England is remote from one—take the best history of the Church you can get—and every county has its archaeological record—and work out the progress of the building for yourself. Study minutely the walling, the mouldings, the methods of building, of working the stone, where the axe was used, where the chisel, the gradual change in style of moulding, of carving, of design, and arrangement in windows and tracing, and in one month you will know more, and have got more pleasure from your knowledge, than from a year's reading. Sketch also, but don't attempt to make pretty drawings. Try and make your drawings look real. Let it suggest the material, the texture, the mode of treatment, the light and shade. Don't be content with putting in a mere line. Draw the masses, the half tones, and the shadows, and in drawing a bit of wall surface with niches, openings, or windows, look on the bit of wall as a variously and cunningly-designed picture, and give not a mere diagram, but a drawing which shall have caught something of the individual spirit, character, life of the building. No two buildings are alike in this respect. Look also for individual methods of work; try and trace a master method in one or more buildings, or parts of the same building. Thus you will realise fully that Architecture was a living thing, the expression of a form of collective vitality, social energy, which has now quite disappeared. These same remarks apply generally to all books on Renaissance Architecture. The same methods of study should be employed. Careful attention should be given to the grafting of classic forms on a Gothic stock, noting the gradual absorption of the stock by the graft until we get a completely classic style—classic in its outline and form, still Gothic in spirit and manipulation. The real classic work dates from Inigo Jones, and Mr. W. L. Loftus's book on him is most useful. Mr. Gotch's admirable and careful book will give an idea of the earlier Renaissance, and no doubt help to form the power of discrimination; but only buildings can teach what is really worth knowing.—Ed.

[The replies to "G. H. B." and "I. R. F. Jun.," will be given in our next issue.]

THE Mersey Dock Board has resolved to spend £86,700 in deepening and improving the north docks, in accordance with the scheme which has been in operation some years,

SOCIETY MEETINGS.

Bradford Antiquarian Society.—On Saturday week the members of the Bradford Historical and Antiquarian Society visited Levens Hall, in Westmoreland. Levens Hall, a fine example of the Elizabethan type of manor house, was described and illustrated in a recent issue in connection with the A.A. Tour in Lancashire.

Newcastle Society of Antiquaries.—The monthly meeting of the Society of Antiquaries of Newcastle-upon-Tyne was held under the chairmanship of the Rev. Dr. Greenwell.—Mr. W. H. Knowles said that in some notes which he read before the Society in November last, on the 13th Century ruin in Armstrong Park—King John's Palace, once the residence of Adam of Jesmond—he suggested certain measures to arrest its further destruction. These were communicated to the City Council, who desired him to attend a Park Committee meeting and obtain an estimate of the cost of the necessary work. He now begged to report that the Council had adopted both suggestions and estimate. He moved that the thanks of the members of the Society, and of all lovers of history and antiquities, were due to the Council for their considerate action.—This was agreed to.—A letter was read from the Chairman of the Lit. and Phil. Society thanking the Society of Antiquaries, on behalf of his committee, for so kindly throwing open the Old Castle and Black Gate Museum to the American librarians on their recent visit to Newcastle.—The Secretary reported that Mr. John Ventress had presented to their Society a plaster cast from the bronze plate of marks of the members of the Goldsmiths' Company.—Mr. Maberly Phillips, F. S. A., read a paper on "An unreported Saxon Stone at Nunykirk, in the grounds of William Orde, Esq." The stone, he said, was the shaft of a Saxon cross. Its base was said to be about ten inches in the ground. From the base to the first moulding it measured 2ft. 11in. All its four sides were beautifully carved, the whole drawn in a very bold and skilful manner. When complete the whole cross would stand about 6ft. to 6ft. 6in., and was most probably a memorial cross erected in honour of some distinguished personage. The whole face was entirely covered with a vine scroll, the stem worked into two small panels, the centre of each being a leaf or bunch of fruit.—Canon Greenwell considered the stone to be a beautiful example of early Saxon work, and suggested the date as the eighth century, or possibly the seventh.

Devon and Exeter Architectural Society.—By permission of the Earl of Mount-Edgumbe the members of the Plymouth, Devonport and Stonehouse branch of this Society visited Cofthele House on Saturday week. The house, which is surrounded by woods, exhibits a proud and all but unique monument of feudal times. The entrance is through a Gothic arch into a quadrangular court surrounded by buildings of granite. The ancient hall retains all the characteristic appendages of knightly dignity, the walls are hung with coats of mail, shields, helmets, spears, guns, swords and gauntlets. The windows are of stained glass with coats of arms thereon. Beyond the dining room is the chapel wherein the family were accustomed to perform their devotions separated from the domestics and vassals by an open screen. The staircase is adorned with old family portraits. The state bedroom and other rooms are hung with very fine tapestry, and the furniture is as it was when the mansion was first built in the reign of Henry VII. Charles I. slept here in 1644, and his son the Prince of Wales in 1645. George III. visited the mansion in 1789, and Queen Charlotte breakfasted there with the Earl and Countess of Mount-Edgumbe, and in 1846 it was visited by Queen Victoria and Prince Consort.

No pains have been spared to make the book on St. Mary's, Oxford, by Mr. T. G. Jackson, R.A., a sumptuous example of combined printing, binding, and illustration. The work has been in hand for years. Mr. Frowde, of the Clarendon Press, is the publisher.

Trade and Craft.

EDINBURGH MASONS' STRIKE.

The dispute between the Edinburgh and Leith master masons and their operatives regarding an eight hours day and other matters, which has been agitating the building trade in Scotland for some time, came to an abrupt and unexpected termination, when at a meeting of the employers it was decided to agree to the terms of the men's letter asking an eight hour day, to commence on 15th February next. It was also agreed to allow the men to return to their work at once on these terms. This decision appears to have been the outcome of the meeting of the Building Trades' Federation, which was held in Glasgow on the same afternoon. It may be remembered that at a meeting of the master builders held on the previous Tuesday the question of a lock-out all over Scotland was considered; but the proceedings were adjourned for the purpose of securing the adhesion of several large firms which were not then represented.

LEEDS ELECTRIC LIGHTING.

The Yorkshire House-to-House Electricity Company is making extensive preparations to meet the demands for current expected during the coming winter. The new buildings are now rapidly approaching completion, and the additional generating plant, consisting of four new Lancashire boilers and four combined engines and dynamos, each of 500 indicated horse-power, have been obtained. The Company now directs attention to modifications in the system of distribution, which has been approved by the Board of Trade, and which are being carried into effect at a large expense. It is stated that not less than £10,000 is being spent this year in improving the means of distribution in a part of the centre of the city, and the new system will be extended to other central thoroughfares as quickly as circumstances permit. It may be explained that hitherto all the Company's cables have conveyed electric current at high pressure, and the conversion to low pressure is done by a separate transformer on the premises of each consumer. Under the new system transforming sub-stations are constructed at various points in the centre of the city, at which the conversion of the current from high to low pressure will be effected by means of large transformers to be there installed. Up to the present four of these underground structures have been built, two in Albion Street and two in Briggate.

A RECORD GRAND STAND.

The largest football stand in the country has just been erected for the Everton Football Club, from the designs of Mr. Henry Woodhouse. The stand is nearly 500ft. long and will accommodate 6000 people. The timber work and concreting has been carried out by Messrs. Roberts and Robinson, Ltd. of Liverpool, and the steel framework and galvanised roof covering by Messrs. E. F. Blakeley and Co., Vauxhall Works, Banastre Street, Liverpool. The uprights and girders for carrying flooring are of H section steel and the principals and purlins of the usual tee angle and flat construction.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BLACKPOOL.—For the construction of the Alhambra Theatre of Varieties, circus, ballroom, restaurant, &c., at the Alhambra (Blackpool), Limited. Messrs. Wyllon & Long, Architects, 16, King William-street, Strand, London. Quantities by Messrs. Woodward and Argent, London.

FULHAM VESTRY. APPOINTMENT OF ASSISTANT SURVEYOR.

The Vestry of Fulham are about to APPOINT an ASSISTANT SURVEYOR at a salary of £200 per annum, paid monthly.

Candidates must be between the ages of 26 and 40, and be thoroughly competent to make surveys, take levels, prepare plans, specifications, and estimates, take out quantities, supervise outdoor work, and generally to be capable of discharging the duties of a municipal Surveyor, and during the Surveyor's absence to act as his deputy.

Previous training and experience with a municipal authority is an essential qualification.

Applications, stating age, experience, present and previous employment, accompanied by not more than three testimonials, to be sent to me, on or before SATURDAY, SEPTEMBER 4th, 1897, under cover, endorsed "Assistant Surveyor."

Canvassing will be considered a disqualification of any candidate.

W. J. H. DENSELOW,

Clerk to the Vestry.

Town Hall, Walham Green, S.W.

BOROUGH of RYDE, Isle of Wight.

The Town Council of the Borough of Ryde invite APPLICATIONS for the APPOINTMENT of BOROUGH ENGINEER and SURVEYOR.

The person appointed will be required to reside in the Borough, to devote his whole time to the duties of the Office (private practice not allowed), the appointment to be determinable at one month's notice in writing by either party.

Salary, £300 per annum, it being understood that no extra remuneration will be allowed in addition to the salary for any work required to be performed by the Council.

No clerical assistance to be found by the Borough, but the Council provides Offices and the usual materials for carrying out the work.

The person appointed will be required to enter upon his duties at an early date.

A guarantee to be provided in a sum of £200 in a Guarantee Office to be approved by the Council.

Personal canvassing will be considered to be a disqualification. Age not to be under 30, and not to exceed 40.

Applications to be addressed to me, endorsed "Borough Engineer and Surveyor," and accompanied by copies of testimonials, not exceeding three in number, which will not be returned, to be sent to the Borough Offices, Ryde, not later than SEPTEMBER 4th.

C. G. VINCENT,

Town Clerk.

ARCHITECT'S ASSISTANT Required at once in a Surveyor's Office in the City. Must be capable of preparing drawings, construction, and other details. State age, salary, experience, &c.—Address, D. A., care Davies and Co., Advertising Agents, Finch-lane, Cornhill.

CLERK OF WORKS (thoroughly experienced) WANTED immediately. Must be a good draughtsman and used to specifications and estimating.—Address, with full particulars, J. W., 12, Temple-chambers, Temple-avenue, E.C.

BUILDER'S CLERK WANTED. Good salary to experienced and energetic man. Applications treated confidentially.—Apply, in first instance, to Mr. W. J. BARTON, Accountant, Bentinck-buildings, Wheeler-gate, Nottingham.

MANAGING ASSISTANT. Provincial Architect requires capable MANAGING ASSISTANT, with London experience, or would co-operate with London Architect in practice for mutual benefit.—Address, in confidence, Box 143, Sell's Advertising Offices, London, E.C.

OFFICE ASSISTANT WANTED as DRAUGHTSMAN and CLERK in Constructional Ironwork department.—State age, qualification, and salary required, T. W. WARD, Fitzalan-chambers, Sheffield.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION OF DRAWINGS at his own office.
G. SCORER, 28, Newmar-street, W.

QUALIFIED CLERK OF WORKS seeks ENGAGEMENT.—T., 1, Chudleigh-villas, Bulwer-road, New Barnet, Herts.

ARCHITECT'S ASSISTANT.—Working drawings, details, land surveying, levelling, and usual office routine. Twelve months' London experience. London preferred. Salary £2 2s.—W. H. B., 29, West End-lane, West Hampstead, N.W.

ADVERTISER desires SITUATION as JUNIOR ASSISTANT. Specimens of work and testimonials.—T. COLLINGS, 34, Clifton-terrace, Brighton.

ARCHITECT and SURVEYOR (young), with time at his disposal, would be glad to ASSIST in preparation of drawings, specifications, and quantities.—A. and S., at Humphreys, 13, High-street, East Ham, E.

ESTIMATOR and CONTRACTOR'S ASSISTANT and a GENERAL FOREMAN. Both well qualified men, now holding situations, desire engagement where both could work together. Capable of taking entire charge and management of Builder's Business or Steam Joinery Works.—Apply KAISER, 87, Alston-street, Ladywood, Birmingham.

FOREMAN of JOINERS and SAWMILLS (first-class) wants RE-ENGAGEMENT. Accurate setter-out. Well up in management of men and machinery. Good draughtsman. References. Abstainer.—E. B., Madgwick, Lion Green, Shotter Mill, Haslemere.

Art and the Wise Men of Dover.

THE ways of Corporations, and especially when they deal with any question however remotely bearing upon Art, are past finding out. Their sayings and doings in this respect would provide a series of most enjoyable comedies, which would well engage Mr. Pinero's attention to interpret for us. The latest and richest example comes from Dover, and relates to the Corporation's treatment of the question of the broken stained glass windows in the main hall of the Maison Dieu. Everyone has heard about this treatment; it has, strange to say, even attracted the attention of political journals, who have not, however, as usual, grasped the real merits of it, or even done justice to another opportunity wherein the indifference of the public to such things, as shown by their representatives, is so exemplified. It needs the brilliant satire of a Whistler to illustrate it thoroughly in words, but we are thankful, nevertheless, to the "Hull Daily Mail," which, in a most excellent leader, ridicules the whole business in a way seldom seen outside artistic Journals. It compels us to pause and pay tribute to an attitude at once so sympathetic and so right. But here is this choice and latest flower from the garden of municipal wisdom:—"An extraordinary incident occurred at Dover Town Council on Wednesday, which illustrates the indifference displayed by some people towards historic memorials. The large stained glass window in the main hall of the Maison Dieu, depicting the embarkation of Henry VIII. for Calais, has recently been broken, and an estimate for its repair was submitted to the Council.—Councillor George Mowll asked whether some "litho-glass," or something like it, would not do to cover the breakage.—Alderman Adcock: Why not suggest that the holes be stuffed up with old rags? I propose the repairs be done.—Councillor Chitty, in seconding, said he thought that when they had such valuable windows they ought to take care of them.—Councillor Ayres: I propose that the matter stand over till the holes are bigger. Eventually this amendment was declared carried.—Daily Paper." We think our readers will agree that the amendment eventually declared carried is matchless as a piece of barbarism towards Art in this or any other country. At least we hope it is matchless. We cannot imagine anything much worse than Councillor Ayres and his sweet advice, "Wait till the holes grow bigger." In truth, on first reading it, we thought the "Hull Daily Mail" was publishing a small burlesque in one act, with gifted Councillor Ayres—immortal Councillor Ayres!—as principal actor. But no, it is stern fact, and Councillor Ayres, we find on enquiry, is very real indeed, and proves himself the uncrowned King of the Philistines with Councillor George Mowll as Prime Minister. These two worthy corporators are representatives — of this unfortunately there can be no doubt — of a greater part of the British public in its feeling towards things artistic. It does not matter whether or no the windows are good or bad Art, these civic busybodies know nothing of such things, and care less. Whether they are dealing with the worst specimen of modern decoration, or the most precious relic of mediæval art, their ways are just the same. They would mutilate the

most sacred things in Art to pose as saving the public purse, or to win the slightest sound of popular applause. That is their end and aim, or, to put it in a more literal way, they want to keep their seats; and from what we have seen of such things, we regret to think they will. It is just the sort of thing to "fetch" the ratepayers. All this, of course, is very disheartening to artists. We are told by sympathetic and art-loving friends, who possess an endearing, lovable sort of optimism, that these things will be righted with the spread of so-called "education." With all respect we think it never will. This age is not an age of Art at all. It is one of steam and electricity and commercialism, and when such things are prominent and living, Art must ever exist in the midst of it, content to be maimed and mutilated, cheered only by the faith of the few artists, and in the patient hope of better things.

The Colchester Competition. Mr. Norman Shaw's Adjudication.

WE publish this week descriptive notes of a competition that possesses, for more reasons than one, a greater interest than perhaps the actual importance of the building would lead us to expect. It was to all intents and purposes a limited competition between six prominent architects, with a novel condition admitting any local men, that was taken advantage of by two firms, one of which unquestionably secured the wooden spoon, while

the other, according to the assessor's report, ran the first premiated design very close, a result that was probably somewhat of a surprise to the Londoners, but which is obviously justified by the excellence of the design. A further interest is imparted by the fact that the adjudication was made by Mr. Norman Shaw, whom we should wish to see far oftener in this rôle, for which his wide knowledge and exceptional abilities render him peculiarly well fitted. We but seldom venture on the thorny paths of criticism with regard to the remarks of our contemporaries, but we feel impelled to make an exception to this course when we read such a furious onslaught as appeared in The Builder on the judgment of an architect who is universally regarded as the doyen of the Profession, and as to whose genius and skill in both the artistic and scientific sides of his Profession there can be no two opinions. As we have made a particularly careful study of the designs submitted in this competition, we happen to be fairly well qualified to give an opinion on the justice or otherwise of this vigorous attack on Mr. Norman Shaw's capacity as an assessor. It is happily beyond our intentions, possibly beyond our skill, to display the powers of invective exhibited in the paragraphs to which we refer, and in view of the fact that full notes on the premiated designs appear on another page, it will be the simpler course to leave our readers to judge for themselves as to the ground that any offer for strictures such as our contemporary indulges in, and we do not imagine for a moment

COLCHESTER TOWN HALL COMPETITION. A REMINISCENCE OF MR. A. B. PITE'S DESIGN.

that anyone who lays claim to any pretension to be a critic of architecture will endorse The Builder's opinion that certain designs have been unjustly ousted from the premiated positions. The public will, we predict, unhesitatingly endorse Mr. Norman Shaw's award, and not that of the author of "Architecture for General Readers." These remarks would be greatly misunderstood if it is thought for a moment that we desire to stifle fair and honest criticism, but we do feel that in this case the study that has evidently been given to the

tingly stating our disagreement with our contemporary's views in this particular case, we feel it a pleasure to be able to express even a qualified approbation of the final suggestion—that competitions should be decided by a representative jury of architects, and not by a single assessor. There certainly are cases in which such a course would be desirable, particularly those in which the practical convenience in planning buildings requiring special technical knowledge has to be weighed against the necessity of securing that the architectural character shall

BIRMINGHAM MUNICIPAL SCHOOL OF ART.

THE Museum and School of Art Committee has issued the programme for the coming season, and also the list of awards made to the students by the Government Department of Science and Art on the results of this year's examinations. The session at the central and branch schools will begin on Monday, September 13th, and the central school is this week open to public inspection from 11 a.m. to 9 p.m. daily. Morning, afternoon, and evening classes will meet there on five days a week throughout the session. In order to meet the convenience of young students whose parents may wish them to attend day classes at the school, either before accepting situations or during their first year or two in the factories or workshops, the committee has arranged for students under sixteen years of age to be admitted to the complete school course at a fee of £3 for the school year, payable in two instalments of 30s. a term. The classes in architectural history and design and in building construction have been re-arranged. Mr. W. H. Bidlake, M.A., A.R.I.B.A., whose students have hitherto been most successful at the examinations and competitions of the Government Department of Science and Art, and of the Royal Institute of British Architects, will continue to teach architectural history and architectural design. Mr. Herbert T. Buckland has been appointed to assist him, on two evenings a week, with the class in architectural design (elementary stage); Mr. Alfred J. Dunn, A.R.I.B.A., "Pugin" scholar and "honours" candidate in building construction, will teach the last-mentioned subject on Mondays and Fridays, from 7.15 to 9.15 p.m.; whilst Mr. Freeman Smith will lecture on Architecture on Monday afternoons and evenings, and on practical plane and solid geometry on Tuesday evenings. Syllabuses of all the lectures are given in the programme. It is the practice of the committee to afford to the masters leisure to proceed with their own painting and other work, and many of them have achieved reputations which are by no means local. Apart from the head master (Mr. E. R. Taylor), whose reputation as an Art teacher is world-wide, Mr. Jackson, the second master, has published "Lessons on Decorative Design" and "The Theory and Practice of Design"—text-books recognised throughout Great Britain; Mr. Creswick, the teacher of modelled design, executed the well-known frieze on the Cutlers' Hall in Fetter Lane, London, and for two years studied at Coniston under Mr. Ruskin; Mr. Harper and Mr. Jelley, the masters respectively of the life and painting classes, have long been known as exhibitors at the Royal Academy; and Mr. Gaskin and Mr. Gere, teachers of designing in black and white and kindred subjects, are, in addition to Sir Edward Burne-Jones, the only artists whom the late William Morris invited to illustrate his famous reprints. The prize list and certain conditions as to the award of free admissions and scholarships have been revised. Messrs. Taylor and Whitfield (Limited) offer a prize for design for furniture, and Councillor William Davis one for design for chasing. A new branch school will be held at the Board School (Montgomery Street), Sparkbrook, Mr. Bernard Sleigh, designer and illustrator, has been appointed master, and Mr. William Haywood, gold medallist, assistant master. Branch classes will also be held, on five evenings a week, at the Board Schools in Clark Street, Ladywood; Cowper Street, Newtown Row; Dudley Road; Ellen Street, Brookfields; High Street, Harborne; Highfield Road, Saltley; Hope Street, Jenkins Street, Small Heath; Lingard Street, Bloomsbury; Moseley Road, Highgate Park; Smith Street, Hockley; Tindal Street, Ballsall Heath; and at the special building in Victoria Street, mainly intended for students engaged in the jewellery or allied trades. In the national competition of all the Schools of Art in the United Kingdom, the Birmingham school has, for the seventh successive year, obtained more awards than any other provincial school, and received, for the first time in the history of the school, as many as three gold medals.

awards renders absurd and immodest a criticism based on such an obviously cursory examination of the designs. As a matter of fact, any difficulty in making the award must evidently have been rather in the relative positions of the first three than in the placing of the remainder, none of which approach the premiated designs in simplicity and convenience of plan. The criticism to which we have devoted this brief notice is of a violence so little justified by the circumstances of the case that the casual reader might well be excused if he imagined that there was something prompting it beyond what met the eye. There is happily, of course, not the slightest suspicion or ground for suggesting any such thing, and we cannot but believe that the author fondly imagined that he was not exceeding the bounds of fair and reasonable criticism. However, we can only repeat that, under the circumstances, he would have better studied his own reputation by giving some consideration to the question before pronouncing, *ex cathedra*, his, to say the least of them, somewhat crude opinions. After having cleared our consciences by unhesita-

be, not of the first rank (that is beyond hoping for in a competition), but not altogether contemptible. One of the assessor's greatest difficulties lies in the fact that some, at all events, of the promoters of a competition are sure to be fairly keen critics on practical questions, while it is unlikely that any have an accurate judgment in Architecture; he, consequently, may feel it his duty to adjudicate from their point of view, and to attach the very slightest importance to the artistic ability displayed. While such a course may possibly meet with the approval of the general public, it is at any rate an open question whether it is not a mistaken one; at all events, it is calculated to produce a feeling of depression when one sees, as one so frequently does, an assessor of great abilities giving the palm to a cleverly planned design, but one possessing not an atom of architectural interest. We doubt whether a committee would be more satisfactory in this respect; the fault is less with the individual architect than with the attitude of the nation as a whole.

COLCHESTER TOWN HALL COMPETITION. SECOND-PREMIATED DESIGN BY MESSRS. BAKER, MAY AND RICKARDS.

COLCHESTER TOWN HALL COMPETITION. FIRST PREMIATED DESIGN BY MR. J. BELCHER, F.R.I.B.A.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

BY OUR SPECIAL REPRESENTATIVE.

By comparing Mr. Mountford's plans with the others published, a good chance for treatment is offered by the main proportions of the façade, but little has been attempted, however, and that the tower succeeds in utterly swamping by its comparatively large scale. This effect is enhanced by the style in which the perspective is rendered. It gives the effect of mouldings and other features of the coarsest description which in execution would utterly wreck a design on such severe lines. The placing of these three designs must have been a matter of some difficulty, and, with Mr. Mountford's clever plan, the assessor may well have hesitated.

From the remaining five sets of designs Mr. Pite's stands right out by reason of his large treatment of the exterior. Though evidently a hurried performance (and to this reason must be attributed the obvious weakness of the details of the scheme), it is one of his most striking works, artistically. "The front, which is a reminiscence of Peterborough Cathedral in Renaissance garb, has a low tower at each end connected by three lofty arches, the main wall of the building being set back some 10ft. or 12ft. The sketch, on page 89, may give an idea of Mr. Pite's suggestion for a commemoration of the Jubilee. It must be said that the other competitors show a lack of loyalty in disregarding this portion of the conditions. It may be taken as the keynote of this design, and any sculptor might be proud to have such a setting for his work. The tower is most cleverly completed with a crown shape, and one is amazed at the cleverness of the drawing of this portion in the perspective, which, by the way, is all suggestion. But here I must qualify my praises, for, on examining the drawing more closely, the tower which at

evoked a considerable effort on the part of half a dozen lights of the Profession to solve a by no means easy problem even as competitions go, from an artistic point of view, with results above the average. In face of certain rumours that have been abroad, and in justice to these gentlemen, it is to be hoped the Corporation will see its way to carrying out the scheme in its entirety.

THE STOCKHOLM EXHIBITION.

THE Exhibition of the Arts and Industries of the Scandinavian Kingdoms and of Russia which is now being held at Stockholm, and which will continue open until October, is sufficiently interesting to be well worth a visit from any travellers whose business or pleasure may bring them within convenient distance of the capital of the kingdom of Sweden. The Exhibition is held at a convenient distance from the centre of the city, and can be reached from the principal hotels in five or six minutes by what may almost be

production of the general effect. Here and there will be found model cottages or dwellings from various parts of the country, from the Laplander's hut to the homestead of the wealthy farmer of the south, all of them completely furnished, and occupied by persons resembling those to whom they would naturally belong. Cages in appropriate positions contain examples of the birds and animals found in different localities, and the Lapps on Skansen are in possession of a considerable herd of reindeer. On various occasions during the Exhibition advantage has been taken of the population of Skansen in order to arrange shows and processions illustrative of the past history of the country, and fairs and other festivals have been of frequent occurrence. The Exhibition itself is contained in a large number of

SEPARATE BUILDINGS OR PAVILIONS.

some of which are public, while others have been erected by individual exhibitors, or by combinations of persons having some common interest. The public buildings, as they may

GROUND FLOOR

PRINCIPAL FLOOR

COLCHESTER TOWN HALL COMPETITION. MESSRS. BAKER, MAY AND RICKARDS' PLANS.

a distance might have been taken as rising from behind the ridge, is shown resting on the centre arch, and so carried by the two slender columns under. Not even the cleverness of the other portion of the design can atone for this. The courts are entered by the double flight of steps behind the statue, and the offices by the door under. All this is most effective, no doubt, but it cannot be said that it is justified by the interior arrangements. Mr. Brydon has spoilt his chances by an endeavour to work in the walls of the existing town hall, which is part of the site, and has placed the courts one above the other. His elevations lack any considerable charm. Mr. Hare's plan is not up to his standard, and is much too "busy" to impress one as a good working scheme. The façade he shows to High Street is well studied and among his best efforts, but, like that of Mr. Mountford, is completely dwarfed by the tower. In the perspective this is absurdly apparent, and even exaggerated by the impossible point of view. Of the two other designs submitted, there is little to be noticed. It remains only to say that Colchester has

described as a procession of tramcars, running along a line specially constructed for the occasion. The various buildings are distributed over ornamental grounds 208,000 square metres in extent, and communicating freely with the equal area of "Skansen," a sort of permanent exhibition of Swedish manners, customs, and modes of life in the past, which occupies a

LOFTY MOUNTAIN PLATEAU

adjoining the Exhibition. This plateau has been applied to its present purpose, according to the "Official Guide," by the enterprise of Dr. Arthur Hazelius, and it is laid out and planted with great skill, and with very beautiful effect, while an electric railway gives convenient access to its highest parts. The roads wind along lofty precipices, affording a succession of charming views of Stockholm and its surroundings, and now and again lose themselves in dells and thickets, some of which are probably in great measure natural, while others are artificial, and all have been employed with great taste and skill in the

be called, are rendered subservient to classification, one of them being devoted to chemical industries and manufactures, another to machinery, a third to education, a fourth to fisheries, and so on. The principal of these buildings, containing manufactured goods from all the countries taking part in the Exhibition, is approached through a square annexe, from each corner of which rises a turret 55 metres in height, and furnished with a lift for passengers. The four turrets are connected at the top by galleries, and the view obtained from these is of extreme interest and attractiveness. Few cities can vie with Stockholm in natural beauty of site and surroundings, and its advantages in these respects have been enhanced by many favourable circumstances. The modern buildings are in harmony with their environment, and the ancient ones, although they have been rendered picturesque by time, have not been suffered to show any evidences of decay. The city is situated at the confluence of Lake Malar with an arm of the Baltic, and now occupies seven islands, besides extending to

COLCHESTER TOWN HALL COMPETITION. - THIRD PREMIATED DESIGN, BY MR. E. W. MOUNTFORD, F.R.I.B.A.

COLCHESTER TOWN HALL COMPETITION. SKETCH OF MR. E. W. MOUNTFORD'S PLANS.

the mainland in various directions. The intervals between the islands are spanned by FINE BRIDGES,

and the innumerable waterways are covered with small steamers, which divide the local traffic with the cabs, omnibuses, and tramcars of the streets. A certain amount of space is devoted to public gardens, well kept and planted, and beyond this bright and busy scene the eye passes to patches of barren rock or pine covered hill, or to more distant country showing signs of careful and profitable cultivation. Of the actual display of goods at the Exhibition there is not much to be said. The invitation to Russia to participate seems to have been an afterthought, and, although it was accepted, it has not led to anything like a representative show of Russian industries. The Exhibition is therefore mainly Scandinavian, and perhaps its most characteristic feature is furnished by the various processes employed in the manufacture and applications of celluloid, and of the various explosives of which celluloid forms the base. Extensive celluloid factories are to be seen near many of the stations on Swedish and Norwegian lines of railway, where the timber which furnishes the raw material is easily accessible. An ingenious advertisement is formed by two enormous parallel wheels of celluloid in the building for the exhibition of chemical products. They are as large as the ordinary water wheels of a mill, and each has attached to its edges an infinite number of sheets of white celluloid, each about 18 in. square, on which words are printed. As the wheels slowly revolve, sheet after sheet falls slowly over and displays its printed surface until this is covered by the sheet next in order. Besides the celluloid, there is a good display of leather, both in skins and in finished articles of various kinds, from purses and tobacco pouches to boots, harness, saddlery, and portmanteaus. Cutlery, also, is well represented; and Sweden has from time immemorial been famous for the fine quality of its steel, inasmuch that its knife blades would probably bear comparison even with those of Sheffield. Some knives in sheaths, of the form commonly worn from the belt in Norway, were of great beauty of workmanship, the handles and sheaths of horn or walrus tooth being most elaborately carved and ornamented, and the price being of corresponding character.

THE EMBANKMENT AND ITS ARCHITECTURE.

A WRITER in the Speaker has something pertinent to say concerning the manner of building on the Victoria Embankment. All the great European capitals, he remarks, have been more or less rebuilt during the last forty years, but nowhere has the activity in brick and mortar, granite and marble, been greater than in London. The first and greatest work undertaken was also the most successful; this was the embanking of the Thames. The elements of success in great urban designs are fewer than is generally imagined; simplicity, fitness, but above all, proportion—these, if allowed to reign undisturbed, can never fail to produce grand effects; the disturbance when it does come is nearly always from one quarter—in the want of harmonious grouping with other designs. It is upon certain rocks, well defined even at high water, that the great rebuilding of London may yet make shipwreck, unless the public or Parliament can be persuaded to intervene. The Victoria Embankment was a

TRIUMPH OF SIMPLICITY

and proportion; a long, gently curving line of granite wall, with trees and gardens above. This was the first stage. It was the greatest architectural event since the rebuilding after the fire of 1666; an opportunity rivalling that of the Venetians when the Rivo Alto became the Grand Canal. Following the lead of the Houses of Parliament, building after building has arisen; the gaps are rapidly filling up; the whole river front from Westminster to Blackfriars is nearly complete; and the people of the capital at this point may well ask themselves if they have made the most of their Embankment. Standing upon Waterloo Bridge, we look back upon one of the most remarkable views in Europe. From Blackfriars Bridge, spoilt by a peculiarly hideous railway bridge, which almost touches it, the long line of buildings up to where we stand is decidedly effective; of sufficient height for dignity, it nowhere exceeds the limits of moderation, and the whole effect is harmonious; the Temple nestles pleasantly in its gardens, and Somerset House—much admired by Canova—stands grandly out upon its great terrace. So far well. But once past Waterloo Bridge—extremely noble in itself—

the scene changes for the worse; all proportion disappears, and structures rear their heads which absolutely

CONTRADICT ALL ENGLISH TRADITION,

overwhelm the older buildings, and, instead of blending with neighbouring designs, obtrude themselves so aggressively upon the spectator that all harmony of effect is destroyed. There is no longer a London: only the Hotel Terrible and its fellows—monsters whose countless windows rise tier upon tier in irritating monotony. From Westminster Bridge the change introduced by these huge masses of masonry in blocking out the view of London is nearly, if not quite, as striking. The charge does not apply to hotels only; other buildings offend equally. The one rule which should prevail in all rebuilding on this important site is to keep every design within such limits of height as shall preserve a certain harmony in the whole of the great arc of the river from Blackfriars to the Palace of Westminster. Were these giant blocks really wanted? Did they arise in answer to any public demand? The question is not quite easy to answer; but the system of living which they involve has been rather forced upon the public than otherwise. We have put aside the battle of the styles, and, as regards their exterior aspect, merely draw attention to the overwhelming and crushing effect upon all adjacent buildings, and the awkward, irregular break introduced by them into what should be a long, curved line of buildings all skilfully harmonised. . . . Buildings as low, and beautiful, as the colleges of Oxford or Cambridge, the writer grants, we cannot expect to see again; but every step of the upward climb, each fresh story piled upon another, should, he argues, be watched with jealous eyes by those who have the appearance of London at heart. We must not be hasty, however, in condemning the architects for these things. They are hampered at every turn by the greed of speculators, the obstructiveness of the departments, and the apathy of the public.

MR. ONSLOW FORD, R.A., has now completed the memorial statue of Dr. R. W. Dale—a seated figure, peculiarly dignified in attitude, and an excellent likeness—and it will soon be sent to Birmingham, to be placed in the Art Gallery.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
September 8th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE relaying of Fleet Street was taken advantage of to carry out partially a very important improvement, though it only brings into greater prominence the necessity for its further extension along the lines already settled. It is now a long time since the County Council, in conjunction with the City Commissioners of Sewers, decided to widen the lower portion of Fleet Street. The block of buildings in which the Punch Tavern is situated was removed nearly a year ago, and the present handsome structures replace it, the frontage being thus put back several feet. Up to now the footway has been just so much wider, but now that the street has been relaid the footway has been made narrower and the street wider, while a "refuge" is being put up in the middle of the street.

It is a pity that the authorities responsible for the paving of Fleet Street should have chosen deal blocks instead of Karri or Jarrah wood, which is now admitted to make the best possible wood pavement. The unhappy experience of Gray's Inn Road, which was formerly laid with deal blocks, and is now being relaid with hard wood, ought to be a warning to all local authorities that cheapness is not true economy.

DESPITE the somewhat poor esteem in which Sheffield is sometimes regarded as a centre for the encouragement of Art, the Sheffield Society of Artists from time to time demonstrates in unmistakable fashion the existence of a society strong in its love of its Profession, whose members are keenly desirous of enabling the public in general to see what is best in the world of colour. Nor are they timorous in submitting their own works to the light of critical examination when placed side by side with those of master brushes. They prove the inherent ability of the local brushes in so doing, and exhibit themselves in by no means an unfavourable light. The success year by year of the Exhibition is also a tribute to the esteem in which the officials are held; because in the suite of rooms opened for public inspection last week they have gathered examples of some of the best work of the last few years. Men whose names are great in art circles have willingly entrusted their canvases to the Society, and Sheffield is richer for the period the Exhibition endures in having the privilege of inspecting a really notable collection, and one which will bear favourable comparison with any preceding show.

STREET-ADVERTISING in many of its forms must be regarded as little better than a public nuisance; but an exception may be made for a new development now observable in the Marylebone Road. The hoarding round the new Grand Central Hotel in that thoroughfare has been completely covered with a huge canvas, which has been painted by Mr. Bruce Smith, the well-known scene-painter. The artist gives a very good view of the building as it will appear when finished. Advertisements figure

prominently in the design, but the artistic effect is undeniable. It, in fact, gives some ground for the hope that we are on the eve of a far more pleasing system of street advertisement than any hitherto adopted. There may be some consolation in the reflection that many ages have similarly suffered. A recent discovery at Herculaneum shows that 2000 years ago posters announcing theatrical performances, public meetings, and electoral addresses were posted on the columns of the public buildings.

A GLOOMY picture has recently been drawn of the present condition of that most magnificent relic of ancient Art, the Parthenon of Athens. The British nation, as the possessors of the Elgin marbles, are naturally interested in the fortunes of the great temple from which they came. "There is no doubt," said Dr. Murray, in the course of a recent interview, "that the Parthenon requires repairing, though the writer to the Times exaggerates in describing the temple as doomed. A good many new stones will have to be inserted, the glaring effect of which will certainly be unpleasant. Nothing, however, that has artistic value will be restored or tampered with. The really serious matter in the present condition of the Parthenon is the rapid destruction by rain and frost of the beautiful western frieze.

THE negotiations which have been proceeding for some time between the Marquis of Bute and the Duke of Fife for the purchase of Pluscarden Priory have now been concluded. The Priory becomes the property of the Marquis, who is to thoroughly restore it. The work of rebuilding will be on an extensive scale, involving, it is said, close on £100,000, and will occupy several years. Part of the Priory is at present occupied as the Free Church, and the upper part is frequently used as a dancing hall. It is about six miles from Elgin, is a centre of attraction for tourists, and the lovely grounds are greatly frequented by picnic parties. The work of restoring old Greyfriars Church in Elgin is being rapidly carried on at the expense of the Marquis, who is also restoring some ecclesiastical ruins in South Wales.

AN important meeting in connection with the scheme for providing the ancient parish and town of Loughrea with a new church was recently held under the presidency of the Lord Bishop of Clonfert. Tenders were opened for the building of the new church, and after consideration the committee in charge of the scheme chose that of Mr. P. Glynn, Dublin, whose figure was £13,000. When completed it is estimated that the cost will be about £17,000. The site selected is that known as Monahan's Hotel, a block of buildings in Barrack Street, and one that commends itself by its central, convenient position in the best part of the town as the most suitable that could be obtained. The meeting further arranged to have the foundation stone laid on October 2nd. The existing sacred building was found unfitted for the requirements of the parishioners through the inadequacy of its accommodation and its growing decay.

THE Athens correspondent of the Standard says: "The alarmist account recently given in the English press regarding the condition of the Parthenon is wholly unjustified by facts. The old commission, consisting of Mr. Penrose (Great Britain), Herr Doura (Germany), and M. Magne (France), is still in existence, and under its supervision a body of Greek savants, aided by the director of the German Institute and a French architect, are constantly at work on the preservation of the building, at the expense of the Greek Archaeological Society. An outlay of 45,000*fr.* has been incurred on the single item of scaffolding for the strengthening of a portion of the west frieze pending the replacing of the architraves and capitals with marble already extracted from the old quarries at Lentelicus.

MESSRS. WALTON AND LEE have just sold to Sir Alfred Seale Haslam the historical estate of Breadsall Priory, near Derby, belonging to

Captain Rothwell, and including the park cottages, and farmlands. The present residence, a building of late Elizabethan date, occupies the site of the ancient priory of Holy Trinity, founded here in the reign of Henry III. by an ancestor of the Dethics for friars of the Cistercian Order, but subsequently converted into a priory of Augustinian canons. The estate was granted by Edward VI. to Henry, Duke of Suffolk, since which it has been in the possession of the Bentleys, the Mosleys, and the Blands, and other well-known county families.

At a special meeting of the committee and governors of the Newcastle Royal Infirmary it was announced that Mr. John Hall, a wealthy shipowner, had offered £100,000 towards the erection of a new Infirmary, either on the Town Moor or Castle Leazes, on condition that the fund already subscribed as a "Jubilee Memorial" should be devoted to the maintenance of the institution. It has already been decided to erect the new Infirmary with the £100,000 subscribed on the present site, which is convenient for the Central Station, but girded by cattle market and railway. The whole scheme, however, will now have to be reconsidered.

THE session of 1897-8 at the Sheffield Technical School, now to be known as the Technical Department of the Sheffield University College, began on Monday. The prospectus for the session gives full information as to the various courses of instruction, and intending students cannot do better than obtain a copy and put themselves in communication with the college staff, who are ready to give every advice as to the instruction most suitable in particular cases. The purpose of the school is to provide instruction in those branches of science, observance of whose principles underlies the successful conduct of all industries. Naturally the industries to which the courses of instruction in Sheffield are made subsidiary are those of the locality—steelmaking in all its branches, the manufacture of machinery, the metal trades in which steel and iron are not used, coal-mining, building, and electrical engineering. Hence the school affords instruction which will be useful to every person intending to engage or actually engaged in Sheffield manufactures, in whatever capacity.

It is high time that Manchester possessed an Art Gallery worthy of the city, says the Manchester Guardian. Mr. Phythian told the City Council recently that the Art Gallery Committee could not do its work properly for want of space. The rooms at the old Royal Institution, in themselves but poorly adapted for the purposes of a picture gallery, are barely large enough to contain the present permanent collection, and will, we think, in a few years be hopelessly inadequate. But the committee has always desired to do something more than form a permanent collection. It has rightly felt that it must organise loan exhibitions of one kind or another to supplement the necessarily small and imperfect series of English pictures possessed by the city. These exhibitions may not always be successful from a commercial point of view—we are sorry to hear that the remarkable Tudor Exhibition, for instance, was a financial failure—but they are always interesting and instructive to those who care for artistic things, and it is to help and to increase this section of the public that the Art Gallery Committee exists. Under the present conditions, however, the Committee is unable to hold any loan exhibitions without throwing the permanent collection into confusion. Mr. Phythian may well protest against such a state of things. If no public-spirited citizen will do for Manchester what has been done for Liverpool, and the City Council continues to postpone consideration of the question, the Art Gallery Committee will soon be reduced to a state of impotence, and the autumn and spring exhibitions will have to be discontinued.

THE Rev. Le Boëuf, writing to the Times, says:—"I thank you for your kind help to the Croyland Preservation Fund by giving at

various times since 1884 brief notices of the progress of the work at Croyland Abbey. We have nearly finished the new east end of the Abbey Church. The three sections still needing immediate repair are the underpinning of the north wall and rebuilding a buttress, the porch, and the roof, for which a further sum of £800 is still required. We are also endeavouring to raise £400 for an organ. I have now written unaided 14,145 letters and reports on behalf of the Abbey Preservation Fund, and regret to state received only the sum of £3272 14s. 10d. during the years 1887 to 1897. May I therefore once more appeal for help from your readers for the venerable, historic, and ancient Abbey Church of Croyland? On St. Bartholomew's Day, 699 A.D., St. Guthlac landed on Croyland Isle, nearly 1200 years ago. Surely the lovers of architecture, historians, and the readers of the late Rev. C. Kingsley's works will help us to raise the sum of £800."

LAMETON CASTLE, where Lord Durham will entertain the Prince of Wales in November, is situated on the northern bank of the Wear, between Durham and Sunderland. It is placed on a steep eminence immediately overhanging the river, and is almost completely sheltered by the woods which crown the valley on every side except the western. A tradition exists that an enormous worm or serpent which infested the river near this spot was destroyed by one of the Lambtons by means of a coat of razors; and a mutilated statue or effigy is pointed out to give credence to the tale.

THE French Academy has come into a legacy of over £27,000. The testator, M. Pierre Lasserre, bequeathed that sum to it subject to conditions. The sum he left is to be divided into three parts, the interest on one part is to go in prizes to the author or authors of literary works, that on the second to the author of a scientific discovery, and that on the third to a musical composer who has produced a notable work so considered by competent persons. The Academy is to pay yearly the interest on two-thirds of the capital to the Academies of Sciences and of Fine Arts.

ADVICES to hand from Cape Town state that definite plans for the erection of new docks, basins, and coaling jetties at Simon's Town are now engaging the attention of the Admiralty. The scheme is a large one, and will, if approved, have a very strong influence on the fortunes and progress of the naval port. They involve an expenditure of some two and a half millions of money, although they have been so drawn up that the scheme will admit of modification and curtailment if considered desirable. Mr. Shield, the civil engineer who had been sent to Mauritius to draw up plans for docks by the Admiralty, called at Simon's Town on his way back, and his scheme, which has been approved by the Commander-in-Chief at Simon's Town, is at present under consideration. It is tolerably certain that docks will be constructed at Simon's Town; but the actual site, the date of commencement of the work, and plans to be followed, are matters on which no decision has yet been arrived at. The docks, if constructed, will take the largest ironclad afloat, and it is possible that an arrangement will be come to with the Harbour Board, under which the Royal Navy shall be entitled to a prior claim on the Cape Town Dock in time of war. For the construction of extensive docks for the Navy, Cape Town is, of course, utterly unsuited. It is anticipated that the new reservoir at Simon's Town, which has a capacity of 40,000 tons of water, will be completed in the course of a couple of months. The reservoir, which has been constructed by the Imperial authorities, will be an immense benefit to the port and to the ships, and will obviate the possibility of drought for the future.

The following prizes and certificates have been awarded in the courses of architectural lectures and architectural and constructional drawing and quantity surveying at University College, as the result of the work and examination of the session 1896-97. Architecture,

Professor T. Roger Smith.—Fine Art: Donaldson Medal, M. H. West, of Maidenhead; prize, G. G. Lean, of Isleworth. Third class: E. Martineau, of Hastings. Construction: Donaldson Medal, C. F. Dawson, of Barking; prize, F. J. Freeman, of Blackheath. Second class: H. S. R. Boyajian, of Kharput; G. G. Lean, of Isleworth. Third class: E. Martineau, of Hastings; W. P. D. Stebbing, of London. Classes maintained by the Carpenters' Company—Architectural Drawing: First prize, J. Porter, of London; second prize, P. H. Pape, of London; certificate, 3, E. C. Desch, of London. Construction drawing: First prize, A. E. Stump, of London; second prize, W. Smalley, of London. Second class: A. S. Kilby, of London; A. Pethybridge, of London; A. Thwaite, of London. Quantity Surveying (Elementary class): Prize, W. B. Payne, of London. Advanced class: Prize, H. C. Simmons, of London. Second class: T. A. Burr, of London; W. Smalley, of London. Third class: H. B. Ward, of London.

AN examination of master and operative plumbers applying for registration under the National Registration of Plumbers was recently held by the Worshipful Company of Plumbers at the Borough Polytechnic Institute. Twenty-six candidates were present from various parts of London and several provincial towns. The practical tests included lead bossing, pipe bending, and joint making. The examination questions included the subjects of roof covering, contamination of drinking water by faulty connections, arrangement of bath, sink, and closet wastes, drainage of town houses, and disconnection with sewers. Five candidates succeeded in passing the examination in practical workmanship.

FOR years past the structural deficiencies of the Paris Conservatoire in the Faubourg Poissonnière have been the object of bitter complaints. The accommodation is utterly inadequate, the building is in the most insanitary state, while were a fire to break out in it there would probably be a perfect holocaust of victims. The probability is that the Conservatoire will be moved before long to the Nouvelle-France barracks in the same street, which will, of course, be evacuated by the troops. The Caserne de la Nouvelle-France was erected early in the last century on the site of an open-air fair, as celebrated in its time as that of the Tivoli or the Porcherons.

JUST now the banks of the Thames, Kennett, and other rivers within reasonable reach of the metropolis are much frequented by students who have entered the Royal Academy Competition for the Hundred Guineas Chiswick Prize, the subject selected being a river lock. Some artists have chosen the old scenes in the Kennett Valley, between Aldermaston and Newbury, a track of wood and stream which always present charms to the landscape painter.

A GREAT deal of criticism has been from time to time offered upon the decorative work which is being carried out by Sir William Richmond in St. Paul's Cathedral. Lately there has been a revival of these expressions of opinion, caused apparently by the publication of preliminary sketches for the mosaics which are to fill the quarter domes. The argument now advanced, that the symbolism of the details used in these designs is out of date and inappropriate, is one that may be safely left for refutation by the artist and the ecclesiastical authorities, who have an expert knowledge of such matters; but the further assertion, that the work already done is in direct opposition to the spirit of the building, involves æsthetic questions which are worthy of wider consideration. What we are asked to believe is that these mosaics, on account of their strength of colour, vigour of handling, and elaboration of detail, do not support, or harmonise with, the style and scale of the surrounding Architecture. They are, in fact, too definite in their imaginative qualities to please the crowd, which sees no virtue in Art that is not realistic in treatment and formal in expression.

THE secret of the whole misunderstanding lies in the fact that, as a nation, we have no real sensitiveness to, or love of, colour for its own sake. We are said to take our pleasure sadly; and certainly the Art that is most popular among us is that which is sombre and subdued, depending rather upon form than colour for its effect. To the average man the grey bareness of the interior of St. Paul's Cathedral, accentuating and exaggerating the mere size of the building, is more effective than the happiest colour combination, and no decorative scheme would be acceptable which did not depend for its results upon largeness of mass and approximation to sombre monochrome. Happily, there is an influential minority which has progressed beyond this rudimentary stage of the national taste, and it is chiefly by their co-operation that Sir William Richmond has been given the opportunity of fitting to the Cathedral decorations magnificent enough to complete appropriately the splendid design of one of our greatest architects. Instead of carping at the work which has been already done, we have cause for thankfulness that it should have been entrusted to an Artist so admirably out of sympathy with popular prejudices.

"THE Act to amend the law respecting the Metropolitan Water Companies" came into operation last week. The first clause deals with the powers of the "proper authority," with "complaints," and with persons who have a right to complain. Under this clause the proper authority to hear any complaint is the body known as the Railway and Canal Commissioners; the persons who have a right to make a complaint are water consumers or any local authority, and they can make a complaint against any of the eight Metropolitan water companies; but the complaint must refer to the failure of the particular Company to perform a statutory duty, or refer to the quantity or quality of the water supplied for domestic use. If satisfied that the complaint is well-founded, the Commissioners, according to the circumstances of the case, are invested with powers to cause the ground of complaint to be removed, impose a penalty, and award damages to the complainant. The second clause gives important powers to local authorities to aid complainants financially in seeking a judgment from the Commissioners—that is to say, whenever a question which appears to be of interest to water consumers within that district ought to be determined. The third clause extends the provisions of the Water Acts of 1852 and 1871 to the whole area within their limits of supply. The last three clauses provide for a publication of a "return" by the Commissioners, and consist of explanatory definitions.

It is announced from Australia that Mr. H. P. Gill, the director of the Adelaide School of Design, is about to visit this country, as the representative of the Public Library Board, to purchase pictures for the Art Gallery. The funds at his disposal are drawn from a bequest made by the late Sir Thomas Elder for the acquisition of works of Art. Mr. Gill is an old South Kensington student, who was appointed to the mastership of the Adelaide School some fifteen years ago.

At the last meeting of the General Committee of the Walsall Science and Art Institute, it was resolved that the arrangements having now been completed for the work being handed over to the Corporation and carried on as one of the municipal undertakings: "That, the Walsall Science and Art Institute, being an institution within the meaning of the Literary and Scientific Institutions Act, 1854, be dissolved as from the 31st day of August, over two-thirds of the members of the Institute having signified in writing their assent to such dissolution, and that the whole of the property of the Institute, and the fittings, furniture, books, and apparatus belonging thereto be and the same are hereby given to and vested in the Mayor, Aldermen, and Burgesses of the Borough of Walsall as the local authority under the Technical Instruction Acts, 1889 and

1891, and the Public Library Act, 1892, they paying all debts and liabilities already or hereafter to be incurred in connection with the Institute, and receiving the grants already earned or now accruing from the Science and Art Department.

REGENT STREET, from end to end, is "up," and for many days not a single vehicle has passed through that well-known thoroughfare. Victoria Street is in a similar plight, and in several other directions minor paving operations are going on. In Pall Mall, Piccadilly, and St. James's Street builders' and decorators' ladders disfigure the clubs, and make walking on the pavements a trial to the nerves; while Oxford Street has its own more permanent trials in the shape of numerous structural demolitions rendered necessary by the progress of the Central London Railway, which runs through its entire length. But if the holiday season has its drawbacks it has also its compensations. The crossing of the Strand is no longer a task of danger and difficulty, as it was a few weeks ago. The natural beauties of the park are to be enjoyed free from those irritating restrictions which are necessary in "the season;" and you may hear the best of music indoors or out of doors untroubled by the social conventions which have to be observed when the town is full. There are many less endurable periods in London than the dog days.

MR. ONSLOW FORD's colossal statue of Dr. Dale is now completed, and is to be unveiled in the Birmingham Art Gallery at the beginning of next month. It is hailed as a most successful representation of the great Nonconformist leader, and has the merit of being, as a work of Art, thoroughly dignified and serious. The difficulty presented by the unpicturesque modern dress has been minimised by judicious treatment; and the limitations imposed by the necessity of exact portraiture have not prevented the artist from giving reasonable scope to his sense of design and instinct for originality.

THE Earl of Carlisle opened at Carlisle the first exhibition of the newly-formed Cumberland and Westmoreland Society of Arts and Crafts. His Lordship is one of the contributors to the exhibition, one of his exhibits being a medallion of Lord Wensleydale, his own grandfather, and also grandfather of Sir M. White Ridley and Mr. J. W. Lowther, M.P. Lord Carlisle congratulated the Society upon its first exhibition. He had been very much struck by the progressive improvement which such societies had made throughout the country. It had been remarkable that if such pre-eminently good work could be done at Keswick and Kirkby Lonsdale, there should be nothing of the kind at Carlisle; but he hoped the new school in that city would not merely be an Art School for Carlisle, but would become the head of the Schools in Cumberland and Westmoreland. He did not wish to criticise the exhibition in an unfavourable sense, but as it stood at present he thought the picture element was too largely represented. As a painter himself he did not wish to say anything to disparage pictures, but the Society ought not to be principally a place for exhibiting easel pictures. Its desire was to encourage art design and the application of the art feeling to industries generally. Commenting upon the competitive designs for a poster, and for the certificate of the Society, he said he thought they were a great justification of the Schools of Art, which were very often unjustly deprecated. When these Home Art Schools were first established a fear was expressed that they might become a sort of adult kindergarten, and ingenious works had been devised, apparently with the intention of keeping people out of mischief. As time had gone on, however, he was very glad to say that benevolent idea had largely dropped behind, and excellence had been pursued for its own sake. There was a danger that places of that kind might become places for the exhibition of amateur work of all kinds. He should be sorry to say anything to

discourage any lady or gentleman from joining the Society, but he did hope the standard they would set up would be a professional and not an amateur one. They wanted to see the best work that could be done, and not what the Americans called a "parlour trick." They did not want that sort of work to which the onlookers said "charming accomplishment!" There was a danger of people thinking that roughness of execution was a merit in itself. No doubt mechanical excellence of execution became tedious if unaccompanied by beauty of design; but he could see no reason why a design should be better from being executed in a comparatively slovenly manner. Looking also at the work of different designers, one was tempted sometimes to wish that people would not follow eccentricity for its own sake.

HIGHGATE ARCHWAY, which in its day was considered a marvel of engineering skill, is soon to be replaced by a handsome span designed by Sir A. E. Binnie, the engineer of the London County Council. The present archway is about 86ft. high and half as much in width, and is formed of stone, flanked with substantial brickwork, and surmounted by three semi-arches, carrying a bridge wide enough for two carriages. The tender of Mr. C. Wall, of Chelsea, for £25,126 has been accepted, and a period of two and a half years has been allowed for the execution of the contract. The cost is to be borne by five authorities. When it is completed, the new archway will consist of one handsome span of ornamental ironwork, completely covering the roadway and part of the embankments and retaining walls on either side. Owing to the proximity of the New River Company's reservoir, however, unusual care will have to be taken.

THE autumn exhibition of the Birmingham Society of Artists, now in course of preparation, is rapidly approaching completion, and promises to be one of exceptional interest and importance. The private view will take place to-morrow, and the exhibition will open to the public on Friday. The post of honour in the Great Room is appropriately occupied by a large and interesting work by the president of the society, Sir E. J. Poynter, P.R.A., entitled "Horæ Serenæ." On the opposite wall hangs a large and characteristic work by Sir E. Burne-Jones, Bart., "The Dream of Lancelot at the Door of the San Grael." Another central place in this room is filled by a large and brilliant work by Mr. Holman Hunt, the subject being "May Morning on Magdalen Tower, Oxford." Opposite this hangs the most recent work by Mr. Walter Langley, R.I., entitled "Charity," a large oil painting possessing much power and pathos. Near to this are large and important works by Mr. David Murray, A.R.A., and Mr. Alfred East, R.I., the former being represented by "Happy Hampstead," and the latter by "A Lonely Road." Mr. C. Napier Hemy sends a large work, strikingly unlike his usual pictures of the sea—this being "A Flemish Calvary, in 1550." Mr. Peter Graham, R.A., whose works are too rarely seen on these walls, is this year represented by a very powerful example called "The Close of Day." Mr. Val C. Prinsep, R.A., is well represented by his "Theodora, Empress and Comedian." Mr. Arthur Hacker, A.R.A., sends an impressive work, entitled, "There was a great cry in Egypt." Mr. James Sant, R.A., sends "The Song of Liberty." Mr. Moffat Lindner contributes one of his very finest works, "The Storm Cloud." Mr. W. A. Breakspere shows to advantage in his large fancy portrait of Miss Coats. Mr. Aumonier has a large and very fine landscape, and Mr. Walter Hunt one of his excellent animal pictures. Among other contributors may be mentioned Mr. G. F. Watts, R.A., Sir Wyke Bayliss, P.R.B.A., Messrs. F. Goodall, R.A., J. R. Weguelin, R.W.S., Carl Schloesser, C. W. Wyllie, Clayton Adams, W. Logsdail, Percy Bigland, John Parker, F. Bramley, A.R.A., Clarence Whaite, S. Melton Fisher, R. W. Allen, and many other artists of eminence. The members of the Society and other local artists are well represented.

THE ancient Parish Church of St. Mary, Gosforth, Cumberland, now undergoing restoration, has proved rich in antiquarian remains. It is not many years since the mythological character of the cross in the churchyard was elucidated. It is believed to be the tallest ancient cross in Britain, and is pronounced "one of the costliest olden roods in Europe." Of red sandstone, elaborately carved with mystic figures in bas relief, it has withstood the storms of twelve centuries, and is in excellent preservation. One of the sculptures represents the Crucifixion. The remains of three other crosses, apparently of about the same age, have also been found at different times in the churchyard. A correspondent states that during the recent alterations two hog-back or coped tombstones, supposed to be one thousand years old, have been found. One was under the foundation of the north wall, built probably in 1125. Another was found at a corner of the nave, forming the foundation of the pillar supporting the chancel arch. The one found in the north wall is in two pieces, and is 5ft. 6½in. long. On one side are carved interlaced ornaments of four patterns; on the other there is a battle scene representing two hostile armies. At the head of one group stands a chief armed with a spear, a circular shield in his right hand; behind him are thirteen warriors, all bearded, and with spears over their shoulders. Opposite stands the chief of the opposing army, holding upright a pole or lance at the top of which is a triangular flag, and behind him also there are thirteen men. The second hog-back is in three pieces, and is 5ft. 1in. long. It has quite a different character. At the apex there is a rope or twist much worn away, and between the rope is the plaited body of a serpent with the head of a wolf, open-jawed, and like those on Gosforth Cross. In a panel 4ft. long there is a design in bold relief of two wolf-headed serpents in fierce conflict with a human figure, which subjugates or rides upon a smaller serpent, and holds one of its jaws in each hand. Hog-backs, whole or in fragments, exist at Bongate (Appleby), Aspatria, Cross-Canonby, and Millom. They are undoubtedly Scandinavian.

WHEN it was supposed that the much-debated scheme of establishing a subway between the Royal Courts of Justice and the legal sanctum of the Middle Temple had been dexterously settled by the stipulation that the City and West End Railway Company should construct the work as the penalty of passing under the Strand, there was a miscalculation of the chances of the Company getting their bill through Parliament. The House of Commons Committee rejected the project, and the Strand Subway is where it was. The Benchers of the Temple have made another application to the District Board of Works for permission to construct the underground passage, and this is to be granted subject to a guarantee that the public are to have free access to it when open for the business of the Courts, and the usual clauses as to the protection of sewers and other property of the ratepayers.

THE huge Roman Catholic Church at St. Giles's Gates, Norwich, is making slow but steady progress. The façade of the old prison still to a large extent hides what is being done, and outsiders might almost suppose that work has been lately at a standstill. On the contrary, the foundations of the chancel and transepts have just been finished, the masonry of the chancel is already rising into view even from the street, and one can now form some general idea of the imposing dimensions of the pile as it will appear when completed. Not half the area finally to be covered by the church has yet been built upon. Where the temporary chancel now is will rise the central tower, from which to the farthest buttresses of the chancel will be 70ft. The progress of the easternmost parts of the edifice will, of course, be much slower than was that of the nave, for whereas extreme plainness characterises the nave, the chancel will be marked by great richness of architectural detail.

Surveying and Sanitary SUPPLEMENT.

SEPTEMBER 8TH, 1897.

Practical Carpentry and Joinery.

BY GEO. ELLIS.

IT is intended in this series of articles to give an explanation of the modern methods of construction and production, as applied to the crafts of the carpenter and joiner, in some of the more important branches of building. To use the information to the best advantage it is necessary that the student should become acquainted with the constitution, &c., of the raw material, and to that end it has been thought advisable to

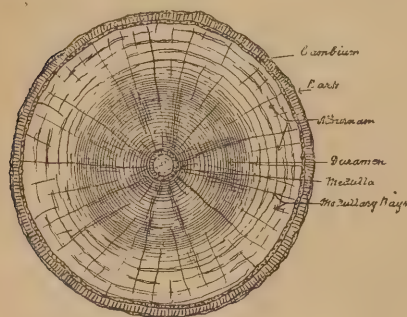

FIG 1 SECTION OF EXOGEN

FIG 2 SEASONING SALKS

commence these papers with a few remarks relating to timber. Trees are divided botanically into two great classes: Endogens, or inward growers, Exogens, or outward growers. It is with these latter only that we have to deal, as the wood used in building is derived exclusively from this class. If we take a transverse section of the stem of an exogenous tree, we shall see that it is composed of a number of concentric rings or layers surrounding the pith or medulla, and enveloped by the cortex or bark. In trees of upwards of two years' growth the pith is usually found dried up, having fulfilled its original purpose of conveying nourishment from the roots to the young plant; as the plant increases in size the supply becomes inadequate, and the

work is taken up by the medullary rays—these are radial lines of cellular tissue connecting the pith with the cambium, or growing tissue, immediately under the bark (see Fig. 1); they are always present in exogenous trees, but in most cases are so minute as to be invisible to the naked eye. They are very distinct in the oak and beech. The outer layers of woody tissue are of looser texture and lighter colour than the inner layers, and constitute the alburnum, or sapwood; the interior zones, compact and dark-coloured, form the perfect wood, known as duramen, or heartwood. One of these layers is deposited every year on the outside of the stem, and is consequently called the "annual ring." The process may be briefly described as follows: In the spring of the year, when the leaves begin to form, moisture, &c., is absorbed by the roots from the soil, and passes up the cellular tissue of the sapwood into the branches and leaves; during its passage some portion of it undergoes chemical change, and exudes under the bark in a thick, viscid fluid, forming a circumscribing film between the outer layer of sapwood and the bark, which, becoming softened, expands in the process. This deposit—the cambium—is gradually transformed into cellular tissue, forming the spring growth of the annual ring. In the autumn (the period of rest for vegetation approaching) the sap descends from the leaves, flowing down over the spring layer, and forming a darker zone of ligneous matter, penetrating and adhering to it. This is termed the autumn growth. A portion of the descending sap, now charged with secretions peculiar to the tree, passes through the horizontally communicating medullary cells, to the inner zones of cellular tissue, depositing its secretions therein, and rendering the cells dense and durable. This is the only part of the tree that should be used for constructional purposes.

FELLING.—Trees should be felled when they reach maturity, and in the winter, when the sap is down, as this substance rapidly decomposes and sets up decay.

SEASONING.—The trunks should be lopped, barked, and hewn to balk as soon as possible after felling, then stacked under cover so that air can circulate freely around them; exposure of green timber to the direct action of the sun and rain is very detrimental, causing the surfaces to be covered with shakes. When the timber is squared it should be stacked as shown in Fig. 2, the top of the stack being covered with weather boarding, the bottom resting on slabs about 6in. thick; air can circulate freely in such a stack, gradually and thoroughly drying it; this is the best method, but is rather long, timbers 24in. square taking about twelve months. The process can be hastened by submerging the logs in running water, with their butts towards the flow, for about a fortnight. This washes out the sap and facilitates the subsequent drying, but it robs the timber of some of its elasticity. Hot-air seasoning, or desiccation, is a very rapid method, but has the drawback of rendering the timber brittle, and also bleaching coloured woods. It can only be applied with success to stuff of small section. The timber

to be dried is enclosed in a small chamber or oven, through which a current of air heated to 120° is driven for a few days. The

FIG 3 SEASONING BOARDS

stuff is then taken out and stacked in a dry room till wanted. To dry boards after cutting, they should be stacked as shown in Fig. 3, with narrow strips of a similar wood between them; waste pieces of oak are frequently used indiscriminately for the purpose, and valuable boards are permanently stained, a result due to chemical action.

PRESERVATION.—Various methods of preserving wood from decay and the ravages of insects have been adopted with more or less success, but two only have come into general use—painting and creosoting—the former is too well known to need any explanation, the latter consists in the filling up of the cellular tissue of the sapwood with oil of tar or creosote, by immersing the timber in containers of the heated oil; this is suitable for weathering purposes in soft woods, but for hard woods, and to render insect-proof, the timber must be heat-dried, the air exhausted from the cells, and the heated creosote forced in under hydraulic pressure. English oak will absorb about 2lb. per cubic foot. Timber that is to be inserted in the ground, as gate-posts, &c., should have the buried portion, and for six inches above the ground, coated with tar and fine sand. The butt ends should be placed uppermost and covered with a capping piece, for moisture is absorbed by the tree in an upward direction, and if the wood is reversed, none will enter from below.

FIG 4 HEARTSHAKE

FIG 5 STARSHAKE

DISEASES AND DEFECTS.—Growing timber is subject to decay at the heart if allowed to stand when past maturity; this period is

reached in from 50 to 120 years according to the species. Rottness is set up when a branch is torn off, or if lopped, so that the plane of the cut approaches the horizontal, as rain will then enter at the wound and decompose the juices of the tree. Dry Rot is the decomposition of the substance of cut timber by the action of fungi, the spores of which

FIG 4 CUPSHAKE

germinate thereon under favourable conditions, and the plants spread throughout the timber in a moist, white, thread-like network, devouring the albuminous substances, and reducing the ligneous matter to dry powder. The situations in which timber is most liable to this disease is when built into walls before they are dry, and without provision for ventilating the recesses; into basements close to or covered by the soil, as floor timbers, wall plates, &c. When the disease has got a firm hold the only cure is the entire removal and burning of the infected material; but the early stages may be arrested by covering the attacked portion and all surroundings with boiling tar or corrosive sublimate. Wet Rot is the putrefaction of the sap in green timber, and is principally caused by the wood becoming saturated with water. Heart-shakes (see Fig. 4) are splits in felled timber across the heartwood, due to air getting access to the interior through the medulla, and so drying that portion more rapidly than the exterior.

STARSHAKES (Fig. 5) are radial clefts in the tree in the direction of its length, due to the expansion of the sapwood in the spring; the heartwood, being denser, does not expand to the same extent, and when adhering firmly to the alburnum, is rent or split as shown in the sketch.

CUPSHAKES (Fig. 6) are clefts or separations between the annual rings of the heartwood and sapwood, and proceed from the same cause as the starshake, but the result is somewhat different. When the expansion of the sapwood occurs, its adhesion to the last formed ring of heartwood not being sufficient to withstand the strain, yields, and the annular cleft results. This form of shake is prevalent in trees with large and coarse annual rings, such as Pitch Pine, Walnut, and Memel fir.

UPSETS (Fig. 7) are a crushing-in of the grain due to end falls of the log, common in brittle timber like Honduras mahogany. Waney edges are due to the attempt to obtain too large a balk from the log when squaring it. Foxyness is the commencement of decay in Oak and similar coloured wood indicated by a

FIG 7 UPSET

reddish-brown stain in well-defined patches. When far advanced the wood crumbles to the touch, and is then said to be rotten.

MARKET FORMS.—The following are the principal forms into which timber is converted for the market: A log is the trunk felled and lopped; a balk is the log squared by axe or saw; a plank in hardwood is any cut stuff over 1½ in. thick and 9 in. wide, in soft wood over 2 in. thick and 10 in. wide; deals, over 2½ in. thick and less than 10 in. in width; battens, over 2 in. thick and less than 9 in. wide; boards, less than 1½ in. thick and over 6 in. wide; die

square, stuff between 5 in. and 9 in. side; quartering, 2 in. by 2 in. to 4½ in. by 4½ in.; fitch, a balk cut in two lengthwise; a square of flooring is 100 ft. superficial; a hundred of deals, 120; a load of timber, 50 cubic feet; a float of timber, eighteen loads. The St. Petersburg standard is the one in general use for computing the quantity of timber in bulk, and consists of 120 pieces, 12 ft. long by 11 in. by 1½ in. To find the number of feet run of any scantling required to make a Petersburg standard, multiply 1440 by 16½, divide the product by the sectional area in question, and the quotient will be the number of feet run.

(To be continued.)

NEW WORKHOUSE INFIRMARY AT SELLY OAK.

THE new Workhouse Infirmary at Selly Oak, which was opened by Mr. F. Houghton (chairman of the Building Committee) on Friday, and which is estimated to cost from £45,000 to £50,000, is situated on elevated ground adjoining the Workhouse. The land slopes from east to west about 1 ft., an inclination which has been taken advantage of in the planning of the pavilions, of which there are four, with sufficient space for an extension of another four, the administrative department being in the centre, with the laundry, boiler-house, engine-house, dynamo rooms, and water tower at the rear. The site covers an area of about six acres. The buildings, which have been built by Mr. Thomas Rowbotham, of Coventry Road, from the designs of Mr. Arkell, are a departure from the generally acknowledged workhouse style, the idea being to make the rooms light and cheerful for the patient, and also to render the surroundings pleasing and elevating. Externally the buildings are of red brick, relieved by dark red-coloured brick and terracotta strings. The roofs are covered with bright-red Broseley tiles, and the

RENAISSANCE STYLE OF ARCHITECTURE

adopted gives a bold and imposing appearance to the structure from the Workhouse Road. Accommodation is provided for about 300 beds, including patients and officials, whilst provision has been made for a future extension of a similar number. In the centre are the one-story kitchen block and administrative buildings, these being connected with the pavilion by covered ways. The doctors' rooms, nurses' general sitting room, serving rooms, matron's rooms, stewards' stores, dispensary, telephone exchange room, and the nurses' and servants' residences are in the centre and under the supervision of the matron, with lavatories, bath rooms, &c., complete. The cooking kitchen, sculleries, pantries, stores, &c., are at the rear of the administrative block, centrally placed and easy of access from the male or female portion of the block. Adjoining the central or administrative block, and off the main corridor, are placed the receiving wards for male and female patients, with lavatories and bath-rooms, supplied with hot and cold water, into which the patient is taken previous to being sent by the medical man into the pavilion wards. The pavilions are arranged nearly north and south, and all of two storeys, and have fireproof floors, there being no direct internal communication between the two floors. The upper floor is reached by an external staircase, opening from the corridor; the hydraulic lifts are provided at each staircase for raising patients from the ground to first floor. A long, wide corridor leads left and right to the different rooms, which comprise eight wards for twenty-four beds each, eight wards for five beds each, eight wards for two beds each for special cases. The large wards are all overlooked from the nurses' duty room or kitchens by a small window. Two labour wards are provided for five beds each, and two separate wards of one bed each at the end of the north female pavilion, to be used for maternity cases. The large wards are admirably lighted, all angles and corners are rounded to prevent accumulation of dust, and the floors are laid

with marble mosaic. Special attention has been given to the sanitary arrangements.

THE VENTILATION

is not dependent on mechanical means, and for simplicity and efficiency is very marked, special aspirating flues having been formed, which produce an up current, and draw off the vitiated air. Steam radiators are employed in cases specially designed to admit fresh air, which enters warmed into the wards at a slow velocity, calculated to change the temperature in each ward three times per hour. Inlets for cold, fresh air are provided, and admit of adjustment, and each large ward has two centrally-placed open fire-stoves, independent of the steam radiators, with stacks of flues, designed by the architect, to be swept externally, so that patients when in bed can enjoy the view of an open fireplace. Access and egress fire-proof staircases are provided to each block, to be used in case of fire, and balconies are erected at each end of the pavilions for the use of convalescent patients. The lighting is entirely by electricity, no gaspiping having been laid. In connection with the fitting up of the infirmary, Messrs. J. Hands and Son have supplied engines and boilers; the Griffin Foundry Company, the hot and cold water appliances; and Messrs. Hassall and Singleton, the kitchen fittings. The electric lighting arrangements have been carried out by the Electric Construction Company under the supervision of Mr. W. J. Talbot; the finishing of the wards has been entrusted to Messrs. J. Parker and Co.; and the laundry has been fitted up by Messrs. Bradford and Co., of Manchester. Messrs. Hill and Son, of Wolverhampton, have provided the water supply pipes.

Surveying and Sanitary Notes.

THE opening of the new waterworks and the technical schools at Bilston took place recently. The new works include engine-house, well-house, boiler-house, machine-fitting and repairing shop and stores; while the plant consists of two boilers, two engines, and two sets of pumps, with the usual accessories. All the machinery is in duplicate, in case of a breakdown. The total cost of the scheme is £45,000, and the work has been designed and carried out by Mr. Baldwin Latham, of Westminster, while Mr. C. L. N. Wilson (the town surveyor of Bilston) has acted as resident engineer.

COLONEL DURNFORD, a Local Government Board inspector, recently held an inquiry at Levenshulme with reference to an application of the Levenshulme Urban District Council for the Board's sanction to borrow £3850 for works of private street improvement. The Clerk explained that in consequence of numerous complaints respecting the condition of Clare Road, Griffin Grove, Henderson Street, Berrie Grove, May Grove, and Manchester Street, the Council had called upon the owners of property in those streets to pave them, and put them in repair. The notices had now expired, and the work would be proceeded with upon the necessary borrowing powers being obtained.

A VISIT of inspection was paid recently by a party of the vestrymen of St. Mary, Newington, to the three depôts established by this vestry for the disposal of the street refuse of the parish, which amounts on the average to between 50,000 and 60,000 tons annually. The Vestry Clerk, Mr. L. J. Dunham, who has organised the system, was able to show that a saving of from £3000 to £4000 a year is made by his method as compared with the dust destructor. The cost varies in London from just over 2s. per ton, which is that of the Newington method, to a little over 4s. per ton, expended by other vestries. At the three depôts visited a different system prevails. At Meopham, in Mid-Kent, the dust is mixed with stable manure

and, under the name of the Newington mixture, is sold to market gardeners as a top dressing. At Sevenoaks, the sweepings of the roads are turned into a deep pond which exists on a freehold estate of twenty-five acres, belonging to the vestry, and eventually, when the pond has been filled, the ratepayers will have obtained several acres of land fit for cultivation. At another dépôt, at Longfield, the dust is screened, and profitably disposed of as breeze to brickmakers; while out of other classes of rubbish a compo is formed, which has taken the place of brick and stone in the building of the dépôts.

At a recent meeting of the Dereham Urban Council held to consider the question of the water supply, the quality of the water was pronounced to be excellent, and it is only a further supply which is needed.—It was suggested by the Surveyor to sink the well to a further depth of 90ft., the depth of the well at the present time being 95ft. The probable

cost of sinking well and new pump, &c., would amount to £1600.—The Chairman remarked that since 1894 they were aware that the water supply was very limited. The pump has now to be worked for twenty hours a day in order to supply sufficient water to meet the demand, which ought to be pumped in ten or twelve hours. The Chairman also pointed out that the Council is bound to supply the town with the water required.—A long discussion took place as to the experiment on boring four holes in the iron cylinder to see if this would increase the amount of water sufficient for the required supply.—Eventually the Chairman moved that the matter be adjourned for six weeks, and the Surveyor be instructed to tap the cylinder at the red sand and flint strata, just above the concrete, about 90ft. from the surface, and produce a report at the October monthly meeting.—Mr. Jex seconded.—Mr. Pearse moved as an amendment that some competent man be consulted before the holes were bored as to the advisability and possibility of obtain-

ing water from this course.—This was seconded by Mr. Merry, and, on being put to the meeting, the resolution was carried by the Chairman's casting vote.

THE Ilkeston Corporation, boring for water at Little Hallam, has now reached a depth of over 1750ft. Water of an excellent quality was met with at a depth of about 800ft., in the first millstone grit; but it was the opinion of geologists that a greater supply would be found in the second millstone grit (the existence of which had been proved by the recent borings at Ruddington), and the Corporation accordingly resolved to bore to a depth not exceeding 1800ft. Within 50ft. of that depth, however, no further water has been reached, although the boring has now penetrated quite 50ft. into a rough sandstone, after passing through a great depth of blue bind. The Corporation is not now very sanguine of meeting with more water within the depth it has been decided to bore.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Sept. 10	Castleton—Walls to Danby Churchyard	Guardians	G. Meggeson, Castleton.

Professional Items.

ABERDEEN.—A handsomely painted window, in memory of the late Professor Robertson Smith, was last week unveiled at King's College Chapel, Aberdeen. Designed by Mr. A. Marshall Mackenzie, the window has four principal lights, each of which is occupied by a figure of one of the Hebrew prophets, those represented being Isaiah, Jeremiah, Ezekiel, and Daniel. In the trefoils there are representations of angels holding scrolls in their hands; and all the figures were designed by Sir Edward Burne-Jones.

The formal ceremony of laying the foundation stone of the new offices for the Aberdeen Parish Council in Union Terrace took place recently. The new offices, which have been already described, are to be erected close to the new School Board buildings. The site cost £3700, and apart from furnishings, the new offices will entail an additional outlay of £6877.

BIRMINGHAM.—The erection of the new meat market in Bradford Street is rapidly approaching completion; and now that the scaffolding is being removed some idea may be obtained of the extent of the building, and of its architectural features. The Public Works Department is engaged in widening the roadways and laying down the footpaths around the market, and considerable progress is being made with the fitting up of the building. It is expected that the formal opening of the market will take place about the end of this month.

After undergoing a thorough renovation, St. Paul's Church has been reopened. An effective scheme of decoration has been carried out by Messrs. Sears and Son, under the direction of Messrs. Gately and Parsons, the architects.

CAMPELTOWN.—The memorial stone of Campbelltown Free Library and Museum was laid two or three days ago. The cost of the Library and Museum is estimated at from £8000 to £10,000. Situated at the corner of Harlem and St. John Streets, the building has a frontage to the bay of 93ft., and to St. John Street of 137ft. It is L-shaped in plan, the ground enclosed, open to Shore Street, being laid out as a garden to form an adjunct to the Museum for the exhibition of archaeological and other exhibits not requiring cover. Internally the buildings are divided into a library or book store, capable of containing 10,000 volumes; a ladies' reading-room, general reading-room, a museum or picture-gallery, and a general hall or news-room. This latter is the general vestibule, and gives independent access to each department. The museum or picture-gallery, as befits its purpose, is finished in the simplest possible way, lighted primarily from the roof; small side windows, which may be covered when the room is used as a picture-gallery, afford opportunities of suitably lighting cases containing smaller exhibits. Externally the building is simple but effective in style. The design might be described as Early Scottish Renaissance.

COVENTRY.—Consequent upon the opinion expressed at the City Council meeting some time ago, the Electric Lighting Committee of the Corporation has considerably modified the proposals which it then submitted. The Committee will on the next occasion recommend that the electric lighting of the streets be not proceeded with, thus saving £2000, and that a further saving of about £5000 be effected by only laying cable mains according as the necessity arises in certain directions. By these proposals the suggested expenditure of £37,900 will be reduced to £31,000.

ECCLESALL.—At the special meeting of the Board of Guardians, Mr. J. D. Webster, architect, of St. James' Street, submitted plans of the proposed administrative block and further hospital accommodation, and it was resolved to adopt the recommendation of the Building Committee, and for the present to only erect

the administrative block and one small hospital, the other work to be carried out when the necessity arises. It was further resolved that the clerk forward the plans of such to the Local Government Board for approval.

EXETER.—In an address by Mr. James Hine, architect, of Plymouth, and President of the Devonshire Association, which we reported last week, mention was made that the west front of Exeter Cathedral was being largely renewed under the direction of Mr. J. L. Pearson, R.A. We learn that this work is not being carried out under Mr. Pearson, but by the direction of a local architect.

GLASGOW.—The past session of the Building Construction Classes at the High (Evening) School has been singularly successful. Twenty-six elementary, and nine out of ten advanced students, who were presented, have passed the respective stages in the recent Science and Art examinations. In addition to certificates, the Glasgow School Board has granted class certificates of proficiency to 26 elementary, 10 advanced, and 4 honours students. The opening lecture of the new session was delivered yesterday.

HENGOED.—The foundation stone of the fabric of the new board-room and offices now being erected for the Gelligaer and Rhigos District Council at Hengoed, was laid recently by Mr. Matthew Truran, J.P., chairman of the Council. Mr. James Jones, the Council's surveyor, has prepared the plans. Messrs. Mainwaring and Davies, of Llanbradach, are the contractors, their tender for the construction of the building being £925.

ILKLEY.—A new Constitutional Club at Ilkley has been opened by Mr. Akers-Douglas. The new premises are situate in Cunliffe Road, and are a great improvement on the accommodation afforded by the old building. The structure stands three stories high, and is substantially built of stone. There is a large lecture hall, 36ft. by 26ft., suitable for meetings, and immediately overhead a well-lighted billiard-room of the same capacity, with two tables. In addition there are smoking, reading, and card rooms. Messrs. Dean Bros., contractors, of Ilkley, erected the building from plans drawn by Messrs. Adkin and Critchley.

LINCOLN.—At a special meeting of the Visiting Committee of the Asylum, held at Lincoln, to receive and consider tenders for certain necessary works, which had been estimated to cost £6125, and for which the several local authorities approved of an expenditure not exceeding £7000, a resolution was passed by the Building and Sanitary Committee, recommending a further expenditure not exceeding £2000, in order to complete the works approved by the Lunacy Commissioners and the Home Secretary. The extra £2000, it was explained, was required, because it was found the work estimated at £6125 could not be kept within the £7000.

LLANTHRITHYD.—Llantrithyd Parish Church, near Cowbridge, was re-opened after restoration, a few days ago. The church of Llantrithyd dates from the twelfth century. The only fragments of this period now remaining are the semicircular tower arch and the holy water stoup, the bowl of which was found embedded in the south wall of the nave. The church is noted for its monuments, the earliest of which dates from the thirteenth century, and represents a female figure with its feet resting on a greyhound and its head beneath a trefoiled canopy, all in excellent preservation. The principal monument in the chancel is a large altar tomb, richly carved and decorated, which was erected by Elizabeth Mansell in 1597. There is also some interesting plate belonging to this church, including a silver communion cup and paten cover—date, 1576. The fifteenth century chancel screen has been repaired. On moving the paint and varnish from the old oak, a good deal of the early decoration in blue, gold, and red was brought to

light, and can now be seen. The work just completed has been carried out by Mr. W. James, of Fommon, under the direction of Mr. G. E. Halliday, the diocesan surveyor for Llandaff.

MORLEY.—Memorial stones of a new Primitive Methodist chapel and Sunday school at the Birks, Morley, have been laid. The building, which will be in the classical style of Architecture, will cost about £1250. The school will form the basement, and provide accommodation for 300 scholars, and the chapel will provide sitting accommodation for 250.

NEWCASTLE-UNDER-LYME.—The commemoration-stone of an institute in connection with St. George's parish was laid a few days ago. The site comprises 1666 square yards, with frontages to North and Hassell Streets. The building will be of Gothic design, of red brick, with stone dressings, and will have a low tower over the main entrance. The large hall or church-room will be fitted with movable platform and seats, and also as a gymnasium. Class-rooms, reading-room, billiard-room, kitchen, &c., are also provided. The architects are Messrs. R. Scrivener and Sons, of Hanley, and the contractor is Mr. S. Wilton, jun., of Newcastle. The cost is estimated at £2570.

NEWCASTLE.—Mr. John Hall, of Newcastle, shipowner, has offered to give £100,000 to build a new infirmary for Newcastle, conditionally upon a site being procured on the Castle Leazes or recreation grounds upon the outskirts of the city; and also that the subscribers of the £100,000 already raised to erect a new infirmary on the site of the existing institution allow their money to be devoted to the maintenance of the infirmary.

NORTHWICH.—At the meeting of the Northwich Urban Council last week the clerk, Mr. J. A. Cowley, reported that the Science and Art Department had intimated that they would contribute £1000 as a building grant towards the Verdin Technical Schools. The County Council proposed to make a grant of £678 in aid of the institution. The Science and Art Department had asked for a statement of the expenditure, and this had just been prepared. It showed that the sum already paid to the builder, architect, and clerk of works was £5940, and to the two former a further £2000 had to be paid. This made the total expenditure on the actual building £8140, towards which £3500 was received from the Verdin Trust Fund—a sum of £26,000 devoted by Sir Joseph Verdin to the promotion of technical education and the endowment of various institutions. Thus, after receiving £1000 from the Department, Sir Joseph will have to provide £3640. The fixtures, furniture, &c., had cost £714. It was decided to make formal application for the grants.

NOTTINGHAM.—The work of reconstruction and alteration which has during the past four months been in progress at the Nottingham Theatre Royal, is now rapidly nearing completion. Externally, the appearance of the theatre has undergone little change.

OWSTON.—The fund for the restoration of Owston Church tower has now reached £533 About £100 is still required to carry out the work, which is about to be commenced by Mr. G. Fisher, of Carcroft.

RYTON, NEWCASTLE.—The foundation stone of a block of buildings which are to be known as "The Robert Simpson Memorial Homes for Aged Miners," was recently laid by Mrs. Simpson. The Stella Company has given the site, which consists of 800 square yards, and the contract price for the building is £1220. The estimated cost of the buildings, including the value of the site, is £1350. The site abuts on the main turnpike from Newcastle to Hexham, and is situated at a place known as Bar-moor, about a mile west of the village of Ryton. The Homes have been designed by Mr. Jas. Archbold, engineer to the Stella Coal Company, and will be built by Mr. Peter Fellowes, Greenside.

Enquiry Department.

GOTHIC VAULTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I trouble you through your Enquiry Department to give me the names of any books dealing with the method of constructing the wooden centering to a Gothic vault, and also as to the setting out of the stonework for same. There seem plenty of works dealing with this sort of thing when finished, but I know of none on the above subjects.—Yours truly,

G. H. B.

You will find the information desired in the "New Guide to Masonry, Bricklaying, and Plastering: Theoretical and Practical," edited by Robert Scott Burn, architect, and published by A. Fullerton and Co., of Edinburgh, and 18, Newgate Street, London. This book contains the fullest details for setting out and working the stonework of Gothic groins and vaults, as well as suggestions as to the making of the centering for the same. To properly understand the latter, however, it seems to us that a thorough knowledge of constructing an ordinary centre is necessary, and for this you will find all that is required in "Tredgold's Carpentry" (revised), published by "Spon," or Crosby, Lockwood, and Co., or in Cassell's Technical Educator, or any standard work on carpentry and joinery.

Correspondence.

CHURCHES IN THE ARCTIC REGIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—On my return from five or six weeks wanderings amongst the way-side Calvaries of north-western Finisterre, I notice in a back issue (July 21st) of THE BUILDERS' JOURNAL a paragraph relative to a church recently built at Blacklead Island, in Cumberland Sound, of whalebone and sealskin, and the remark is passed that this is, perhaps, the only church existing within the Arctic Circle. That is not a fact, however, although it is possible it may be the only church of the kind (of the same materials), as such structures are necessarily only very temporary. I remember precisely the same kind of edifice erected in the land of the wandering Eskimo, some few years ago, that did very well so long as summer lasted, but when winter, and its dearth of food to man and beast came along, the sleigh dogs attacked it, and long before daylight (the continual darkness exists from November 21st to the 21st day of the next January) had ate the whole of it up.

I have seen a number of permanent churches, and very good ones too, some of them far up beyond the line of the Arctic Circle. At Tromsø (69 deg. 38 north lat.) for instance, a city of some 6000 inhabitants, there are several churches, particularly a fine Roman Catholic one. It is the seat of a Bishopric. Again, at Hammerfest (70 deg. 40 north lat.), the most northerly town in the world, a place of about 3000 souls, there are two churches: one with a low spire is near the landing-place, besides an old stone mortuary chapel in the cemetery, situated on high ground just outside the town.

Yours faithfully,

HARRY HEMS.

MESSRS. E. SAUNDERS AND SON, surveyors, 6, Bishopsgate Street Without, are superintending the carrying out of various structural alterations at 3, Brewer Street, Clerkenwell.

EFFORTS are now being made by the Willesden Board of Guardians to acquire a site near Willesden Green, and erect a workhouse there at an estimated cost of £50,000.

THE Finance Committee of Liverpool City Council has passed a recommendation to issue £2,500,000 Corporation Stock, to cover the cost of electric light, the acquisition of the tramways, the introduction of electric trams, and for other public works.

Trade and Craft.

A REMARKABLE CATALOGUE.

MESSRS. YOUNG AND MARTEN, STRATFORD.

We have been favoured with an advance copy of the remarkable catalogue about to be issued by Messrs. Young and Marten, the well-known builders' merchants. The development of the trade catalogue, of late years, verges upon the phenomenal. Within recent remembrances, firms—even of eminence—were content with a modest volume, scanty in detail, and bald of illustration. A more or less accurate list of prices, with a few cheap line-blocks, satisfied the general idea. But we have changed all that. Nowadays, the trade catalogue of a leading house assumes the dimensions of an encyclopædia, and is sent forth with all the excellence that costly care can secure. From time to time, we have suffered many things from catalogues and their necessary study. Good or bad, the conscientious reviewer must wade through his task. Occasionally this toil is far from a labour of love, and results in remarks more candid than courteous. Even a catalogue—most essentially prosaic of publications—can, however, satisfy the critical mind under certain conditions. Such a catalogue must be clear, yet concise. It must be adapted to its end. It must leave nothing to the imagination. Its possessor must be able to gather from its pages a complete idea of the scope, the style, and the economic advantages of the firm whose business it professes to illustrate. In addition, an up-to-date catalogue is expected to be well got up, beautifully printed, profusely illustrated, and handsomely bound. Starting with this somewhat exacting ideal, we have examined carefully Messrs. Young and Marten's latest issue. In appearance, their new general catalogue is a handsome work in two volumes, royal quarto, half-bound in leather, and containing some 900 pages. The paper is of good quality, its surface well adapted to illustrations. The type is clear: the printing quite satisfactory. Many thousands of blocks in line, half-tone, and colour illustrate the pages of this strikingly comprehensive compilation. The architect or builder who fails to find herein the meed of his desires must be bad to satisfy. For practical convenience the catalogue may be had in sections, complete as regards one department only. This method of sub-division has become a recognised custom, and is of equal advantage to the firm and their public. The separate sections before us comprise the sanitary, stove and range, painting, glass, and gas department. One and all they are of admirable lucidity and fulness. In each section the articles comprised are illustrated with care and accuracy. Among Messrs. Young and Marten's specialties one of the most useful is the series of kitchen ranges, known respectively as "The Pioneer," "The Leader," "Victorian," "Georgian Essex," "Alberti," and "Alexandrian." This series exemplifies the completeness of this catalogue in many other sections, ranging, as it does, in size from the small range adapted for a suburban villa, to the complete apparatus requisite for a country mansion or a London hotel; and in cost from a useful thirty-shilling article to some elaborate fifty-guinea production. Indeed, the whole catalogue—allowing occasional divergence from the beautiful in the effort to meet all kinds of taste, good and bad—is an admirable example of its kind. Nothing seems too trifling to receive due attention. A philosopher has told us that "Nothing is trivial that makes for perfection," and these laboriously elaborated volumes prove their authors to have grasped this philosophic axiom. It is always gratifying to see work well and fitly done. We are, in consequence, pleased with this outcome of business forethought—Messrs. Young and Marten's general catalogue for 1897—and can do no less than recommend it to the notice of the many professional and business men among our readers who have learnt to place reliance upon our judgment.

SHEFFIELD.—Mr. F. E. Smith and Mr. Henry Adams recently laid the corner stones of a new building, which is being erected at the rear of John Street Primitive Methodist Chapel, in order to provide much-needed accommodation for the Sunday School and Institute. The new premises, which are being erected by Mr. John Morton, of John Street, from the design of Mr. C. J. Innocent, architect, of George Street, will consist of an infants' school-room, with gallery, four other class-rooms of good size, and two large assembly-rooms, of which one will be for the junior institute and the other for the senior institute. The cost of the scheme will be over £2000.

S. PAXTON.—A stained glass window has just been placed in position in the parish church. The window is a very tasteful geometrical design, and bears the Royal monogram and crown, with the dates 1837 and 1897 wrought in medallions.

SPENNYMOOR, DURHAM.—On Wednesday last the foundation stones of the new Sunday school in connection with the Baptist Church, Spennymoor, were laid. The building consists of lecture hall and schoolroom, 33ft. by 30ft., with class-rooms on each side. The lecture hall is lighted by large windows at the end, and by clerestory windows over the class-rooms. The latter are separated from the lecture hall by folding partitions, so that the accommodation in the hall may be increased when necessary. Ample ventilation is provided by means of the clerestory windows and exhaust ventilator on roof. It is intended ultimately to renovate and re-seat the church, build a new baptistry and platform, and form a connection between the church and the new school. The work is being carried out from the plans of Mr. J. W. Hanson, architect, of South Shield and Jarrow, by the builder, Mr. R. Telfer, of Spennymoor, Durham.

ST. HELENS.—Foundation stones of a new Sunday school have been laid. The school is being erected, at a cost of about £1500, on the site of the old school chapel. The building which has been pulled down was erected about fifty years ago as the central school and chapel of the body. About twenty years ago the new chapel in Westfield Street was built, and the whole of the old premises used as a school.

WESTBURY-ON-SEVERN.—At a meeting of the Board of Guardians it was stated that the cost of the new Workhouse Buildings would be as follows: Tramp wards estimated at £2000, the officers' quarters at £3000, the laundry at £500, the children's probationary ward at £500, and other work at £1000, making £7500. The proposed loan of £7500, repayable at thirty years, could be borrowed on an annual repayment of £350, and the homes and the children boarded out would cost another £300, making a total expenditure of £650 a year.

WOLVERHAMPTON.—At the recent meeting of the Board of Guardians the Committee appointed on February 5th last to consider offers of sites for a new workhouse, reported that it had inspected the land which had been offered, and had had interviews with Mr. E. B. Wetherhed (Local Government Board inspector) and Mr. Gordon Smith (the Local Government Board architect), who had visited several of the sites. The committee recommended for the consideration of the Guardians the following: About thirty-five acres in Hordem Road, for which £325 per acre was asked; about fifty-six acres at Wood End, price £4000; and about fifty acres at New Cross, with farmhouse and buildings, the sum asked being £11,000. The Committee was in favour of the New Cross site, and this was agreed to by the casting vote of the chairman.

WOMBWELL.—A further appeal is being made for the new parish church, the nave and aisles of which are being built. These are estimated to cost when completed £4500, and the work of building is now making rapid progress. Attention is now called to the great necessity of finishing the edifice by the erection of a chancel and tower. To do this another £4000 will be needed.

ADVANTAGES OF INCANDESCENT GAS LIGHTING.

A report of considerable interest to municipalities whose street lighting is by means of gas, has been issued by the superintendent of street lighting of Liverpool, Mr. Bellamy. Up to a recent period the street lighting of Liverpool was exclusively by gas. In the leading thoroughfares electricity (provided by the Corporation) has taken its place, but elsewhere gas lighting is still relied upon, and in regard to this matter, the superintendent reports upon the comparative results arising from the use of the ordinary flat flame burner and the incandescent burner. The report is carried into great detail, showing exceedingly close observation and calculation. The pilot light or "bye-pass" arrangement was first tried with the incandescent system, but was found unsatisfactory. The pilot lights were untrustworthy, a proportion of them becoming extinguished during the day, necessitating a special visit of the lamplighter with a ladder after completing the lighting of his district. Added to this was the deterioration of the mantle caused by the use of the "bye-pass," whilst the cost of the maintenance of the pilot light in consumption of gas was assessed at 25ft. per hour, amounting to an annual consumption of 1428 cubic feet per burner, representing in cost 4s. 3d. per annum. This and other matters were regarded as unsatisfactory. The experiment was next tried of abolishing the pilot light, and lighting the burner by means of a match and ladder. The report shows this system to have been both costly and inconvenient, whereupon the attention of the officials was directed towards lighting the lamps by a torch and pole in the same manner as ordinary street gas lamps have been for many years lighted. Some special mechanical adaptations of the casing of the lamp were found necessary for this purpose, but these were provided. The system remains now in use, and it is possible to give comparisons which are very distinctive. They show that in brilliance of illumination the incandescent lamps are superior to the older type, that the consumption of gas is less, and that the total cost of street lighting is reduced. The conclusion, says the superintendent, is that a general extension of the system seems irresistible.

THE LARGEST GRAVING DOCK.

A steel floating dock, which is regarded as the largest of its class in the world, and which has been built by Messrs. C. S. Swan and Hunter (Limited), Wallsend-on-Tyne, for the Spanish Government, was successfully launched a few days ago from the pontoon yard of that firm. The dock is 450ft. long and 82ft. broad, and has a lifting power of 10,000 tons. It is designed for use at Havana, and will accommodate any cruiser or liner in the world, provided that the dead weight in docking trim does not exceed 10,000 tons. There are no gates at the ends of the pontoons to prevent a ship of a greater length than 450ft. overhanging to any extent. The dock was built in eight months, and the cost is said to be small in comparison with that of a stone graving dock.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AGHALEE (Lurgan).—For the erection of a dispensary and dispensary residence, Folly Hill, Aghalee, for the Lurgan Union.—

Chas. Boyd and Sons, Ormeau-road, Belfast ... £910

BATLEY (Yorks).—For the erection of twelve houses, &c., Talbot-street. Mr. J. H. Brearley, architect, Hanover-street, Batley.—

Masonry.—C. Robinson ... £1,000

Joinery.—J. W. Nettleton ... 380

Plumbing.—Exley Bros. ... 39

Plastering.—W. Parker ... 120

Slating.—Geo. Hargreaves ... 165

Painting ... 37

BATLEY (Yorks).—For extensions to Lady Anne Mills, Culver-road. Mr. J. H. Brearley, architect, Hanover-street, Batley.—

Masonry.—H. Crossland ... £380

Joinery.—H. Parthwaite ... 420

Plumbing.—Exley Bros. ... 78

Slating.—W. H. Thompson ... 70

Plastering.—S. Crawshaw ... 20

Ironfoundry.—Clay, Henrique and Co. ... 80

BATLEY (Yorks).—For the erection of four houses, &c., Dark-lane. Mr. J. H. Brearley, architect, Hanover-street, Batley.—

Masonry.—Thos. Oldroyd ... £360 0

Joinery.—E. Sykes ... 110 0

Plumbing.—H. Wood ... 23 10

Plastering.—Kitchingman and Raye ... 30 0

Slating.—J. M. Thornton ... 35 0

BATLEY (Yorks).—For the erection of four houses, &c., Knowles-street, Purlwell. Mr. J. H. Brearley, architect, Hanover-street, Batley.—

Masonry.—S. S. Baines ... £420

Joinery.—E. Sykes ... 135

Plumbing.—Exley Bros. ... 18

Plastering.—J. Greenwood ... 40

Slating.—W. H. Thompson ... 40

[All of Batley.]

BEXLEY (Kent).—For the construction of a new road on the Maypole Estate, for Messrs. Jennings and Fell, land agents, 3, Broad-street-buildings, London, E.C.—

R. W. Swaker ... £260 0 0 J. Brewer ... £590 0 0

W. H. Nicholls ... 714 2 4 W. H. Wheeler ... 573 0 0

F. Adams ... 680 0 0 Porter ... 580 0 0

T. A. Osborne ... 643 0 0 Lawrence and ... 489 11 2

Kent Road Co. ... 599 6 2 Thacker* ... 489 11 2

* Accepted.

BOLSOVER.—For the restoration and enlargement of St. Mary's Church, Bolsover. Mr. Louis Ambler, architect. Quantities by Messrs. Pinks and Watson, 45, Parliament-street, Westminster.—

G. Fisher Bros. ... £9,670 4 8 Chas. Trask and ... £8,479 6 6

J. Norris and Son ... 9,230 0 0 Rudd and Son ... 7,877 0 0

Luscombe and Son ... 8,725 0 0 Bowman and Son ... 7,776 10 6

G. M. Thompson ... 8,497 15 0

* Amended estimate accepted.

BOURNEMOUTH.—For extension of premises, Nos. 8, 10, and 12, Old Christchurch-road, for Messrs. Plummer, Roddis, and Tyrell, Ltd. Messrs. Pearce and Offer, architects. Quantities by Messrs. Jennings and Goater.—

McWilliam and Son ... £7,675 Jones and Son ... £7,435

F. Hoare and Son ... 7,608 George and Harding* ... 7,425

Jenkins and Son ... 7,442 Miller and Sons ... 7,294

W. Hoare ... 7,442

* Accepted.

BRANKSOME.—For the erection of a new infants' school, &c., for the School Board. Mr. Samuel J. Newman, architect.—

G. Baker ... £1,570 J. McWilliam and Son ... £1,295

G. Bevan ... 1,479 W. J. Cross ... 1,175

W. J. Wallis ... 1,453 F. Elcock Bournem. ... 1,175

Burt and Vick ... 1,372 month (accepted) ... 1,180

CHARLTON KINGS (Gloucester).—For erecting school buildings, for the School Board. Mr. J. Villar, F.S.I., architect, 1, Cambray, Cheltenham. Quantities by the architect.—

Capper and Son ... £2,213 0 Collins and Godfrey ... £1,779 0

A. Cleveley ... 1,998 10 W. H. R. A. Hunt, ... 1,740 0

Malvern and Sons ... 1,843 0 Cheltenham* ... 1,740 0

Allen Wilson ... 1,787

* Accepted.

CHURCH GRESLEY.—For the erection of a Wesleyan church, for the trustees, Mr. E. C. Clarke, architect, Prudential-buildings, Nottingham.—

Bromhead Brothers ... £2,645 8 J. H. Vickers, Ltd. ... £1,889 0

T. Barlow ... 2,194 0 E. Clarke ... 1,640 0

J. Hutchinson ... 2,094 0 C. Venning, Swad. ... 1,473 0

H. Vickers ... 1,920 0 lincoate* ... 1,473 0

Harrison and Slater ... 1,913 0

* Accepted.

CONGHAM (Norfolk).—For works of restoration of St. Andrew's Church (first contract). Mr. Herbert J. Green, architect and surveyor, Castle Meadow, Norwich.—

Cornish and Gaymer, ... Jno. Boddy, Harp. ... £508 0 0

North Walsham ... £242 4 2 ley, Swaffham* ... £508 0 0

W. J. Lamer, East Dereham ... 507 4 6

* Accepted, conditionally.

HULL.—For the erection of a junior department for 264 children, for the Kingston-upon-Hull School Board. Mr. W. Botterill, architect and surveyor (Messrs. Botterill, Son, and Bilson), 23, Parliament-street, Hull.—

Lison and Sons ... £2,386 2 0 Simpson and Son ... £2,776 8 8

G. Houlton ... 2,913 0 0 Hockney and ... 2,774 0 0

M. Harper ... 2,893 0 0 Liggins* ... 2,774 0 0

F. Beily ... 2,780 0 0

* Accepted.

LONDON.—For the erection of Union offices, Board-room, register office, &c., at Tooley-street, S.E., for the Guardians of the Poor of the St. Giles's Union. Messrs. Newman and Newman, architects and surveyors, 31, Tooley-street, London Bridge, S.E. Quantities by Mr. W. T. Farthing, 46, Strand, W.C.—

G. Sharpe ... £23,788 Goddard and Sons ... £21,544

Howell J. Williams ... 23,656 C. Wall ... 20,767

W. Downs ... 22,737 Johnson and Co. ... 20,190

W. Wallis ... 22,394 J. Bullers, Bermond. ... 18,980

Balaam Bros. ... 22,385

* Accepted.

LONDON.—For altering No. 95, Rye-lane, Peckham, for Messrs. Davies Bros. Mr. John Jas. Downes, architect, 190, Lewisham High-road, S.E.—

Sims and Wood ... £1,120 S. K. Best ... £849

Jerrard and Son ... 890 Clampton (accepted) ... 737

LONDON.—For the construction of roads and sewers at Crabbrook Park Estate, for Messrs. W. P. Griggs and J. W. H. Thompson. Mr. Edwin H. Moore, 37, Old Queen-street, Westminster, and Mr. J. B. Ball, engineers, 31, Tooley-street, Westminster.—

John Burrill ... £4,068 0 0 John Jackson ... £3,800 0 0

Our Country Villages.

THE Daily Chronicle paints a lurid picture of the sanitary condition of our country villages. The Arcadian idea it dismisses as "a mere piece of fiction," and proceeds to say that "over wide districts sanitation is an unknown thing; damp, decaying, and overcrowded cottages, filthy water supply, soils rotten with the soak and leakage of old dead wells and cesspools, and the continual presence of fever, whooping cough, and diphtheria—that is a picture of our rural districts nearer the truth than the delightful Arcadian conception." This we should be inclined to doubt. While such may possibly be the condition of certain isolated villages, we contend that it is by no means a fair description of the great majority. The probability is that the truth includes both extremes. In Arcadia, as we conceive it, certainly "sanitation is an unknown thing." Drains, sanitary inspectors, and doctors are not required. The fact seems to be that, given an open-air life and occupation, and sufficient food and clothing, the human species can and does flourish in surroundings which to us seem grossly insanitary and dangerous. We have in mind a fishing village of about 1000 inhabitants. The houses are jammed against and almost on the top of one another, in the hollow between two steep hills. The great majority have neither forecourt or garden of any description, many get light only from the front, the living rooms are often far below the level of the ground on one side of the house, but few houses in the place have any sort of earth closet or convenience of any kind. Refuse is thrown into the harbour or dumped in the corner of any available space, and at times the stench is intolerable. It is an instance of open defiance of every known law of sanitation. Yet the death-rate is one of the lowest in England, typhoid fever and diphtheria are no more prevalent than elsewhere, there are very few deaths in the prime of life, and the place is considered most healthy. It seems to us that in these days of sanitary congresses, and surrounded as we are with such wonderful and ingenious contrivances which it seems a pity not to use, architects are apt to forget that sanitation, as it is generally understood in our large towns, including an elaborate drainage scheme and such fearful and intricate systems of ventilation, is after all nothing but a precaution, a sort of antidote rendered necessary by the habit human beings have of herding together in large numbers, and so enfeebling their constitutions and over-refining their sensibilities. It is not a necessity of existence. Till within the last century or so open drains were considered good enough. Some are of opinion that in protecting our nostrils we are really endangering our health. It certainly appears to be generally acknowledged that it is in the closed drain that the danger lies. Those of us who practise in the large towns where covered-in drainage is insisted upon, and every detail settled for us by authority, are apt to grow accustomed to it, take it all for granted, and consider that a house could no more do without drains than without a roof. We then apply the same elaborate system to country houses, with a cesspool to take the place of a main sewer. Of late years we have grown more "nice" in our habits, perhaps a trifle squeamish. People are not

content now with the accommodation that was sufficient for their grandfathers, and in their country houses they expect pedestal closets and all the latest improvements of sanitary science. It is forgotten that all these things have been invented to meet the requirements of conditions that do not exist in the country. They become a most expensive luxury, and, with all respect to our sanitary experts, perhaps as dangerous as they are expensive. In towns it has become necessary to cover in the drains; this is a dangerous method, which has led to all these contrivances for isolating the drains from the house, and preventing the passage of sewer gas. The more perfect these contrivances the better, but surely the ideal system would be one that did not create this sewer gas at all. To cover in drains is wrong in principle—the only thing we can do is, by the perfection of our apparatus, to make them as harmless as possible in practice. Instead of confining our efforts to the invention of more and more perfect traps and joints, should we not rather try and find some method of doing without them alto-

to our mind the safest thing yet invented, and it ought not to be beyond the skill of our architects to arrange them in such a way as to conform to our ideas of decency and comfort. In brief, covered drains are a danger; if we must have them, we must, and let them be as perfect as possible; but if we can possibly do without them, even at some loss of convenience, it will probably be found the safer plan.

L.C.C. Projects. A SUMMARY of the past year's work of the London County Council has already appeared in our pages. A short review of other municipal matters and projects not dealt with therein may be of interest. Some attention has been devoted to the Coldharbour Lane, Rosebery Avenue, and Sandy's Row improvements, and also to improvements carried out jointly by the Council and local authorities. The Committee refers to the question of the Council's failure to let land, and states that it has given the subject considerable time and attention. At first it was thought that to some extent it was owing to the stringency of the build-

A "BIT" OF OLD SHEFFIELD.

gether? A perfect drain may be perfectly healthy, but an imperfect one is perhaps worse than none at all. As they are all more or less imperfect, this seems to us the danger, and when it comes to introducing this covered system into small villages and country houses, we have doubts as to the wisdom of the proceeding. The earth-closet in the garden is

ing conditions, but, upon close examination, this was not found to be the case, inasmuch as in the days of the Metropolitan Board of Works similar conditions obtained, and the Board rarely failed to find tenants. At the same time the Committee found that the late Board did not enforce the conditions to the letter, except in the case of an unscrupulous tenant, whereas the Council's practice was not only to

enforce compliance with the conditions in all cases, but to make the architectural supervision of a somewhat severe character. After looking at the matter from all points of view, it came to the conclusion that the method of supervision generally caused delay in approving plans, alterations in plans, and in granting leases, and, as a consequence,

BUILDERS SUFFERED SERIOUS INCONVENIENCE.

It was, therefore, obvious that the Council as landlord did not, from a tenant's point of view, compare as favourably as it might do with other ground landlords, and that to remedy this a wider authority and discretion would have to be reposed in the architect. The procedure accordingly had been amended with regard to buildings to be erected on the Council's land, so that the architect is now responsible for the approval of plans and specifications for buildings and all alterations therein during the course of construction. It will no doubt take some little time before the changes will produce the effect desired. When the changes are widely known the Committee opines that it will be much less difficult to dispose of the Council's vacant land than it has been heretofore by reason of bidders who have been deterred from coming forward in the past holding back no longer. In 1896, the Committee reported to the Council that the valuer estimated the total cost of the ground plan of London, showing the various ownerships, at £4000. Of this sum, £1750 has been sanctioned by the Council to be expended up to March 31st, 1897, in connection with the work. Up to the present time information has been obtained from the Middlesex Register in respect of 198 estates, of which sixty-eight have already been defined upon the sheets. At present 1670 estates have been defined, and 134 estates are waiting to be defined.

THE PROPOSED NEW OFFICES.

Three years have passed since any recommendation was made by the Committee with reference to a site for new county offices, the matter was in the early part of last year again the subject of much consideration, and the Committee arrived at the conclusion that, in face of the difficulty of finding a suitable site, the Council would be well advised to effect an extension of its present offices in Spring Gardens. This conclusion was much strengthened by the circumstance that the long-talked-of alterations in connection with the erection of the new Admiralty buildings, and with the opening up of the Mall by the construction of a new avenue leading into Charing Cross, seemed likely at last to be proceeded with. It was also felt that, as the Council and its predecessors, the Metropolitan Board of Works, had been in occupation of Spring Gardens for upwards of thirty-six years, an extension was preferable to removal to some other locality. It accordingly reported to the Council on June 2nd, recommending that application should be made to Parliament for power to acquire the site lying between Spring Gardens and Trafalgar Square, comprising, with the site of the existing County Hall, about two acres. The estimated cost was £813,000, £203,000 of which represented the cost of making the Council freeholders of the leasehold premises it now occupies. Of the remaining £610,000 the greater part was attributable to the properties facing Trafalgar Square, and it pointed out that if the ground floor and basement of this frontage were utilised for such purposes as banks and insurance offices, a recoupment might be secured of considerably more than one-third of the whole cost of acquisition. A resolution was eventually come to in favour of the recommendation, but the second reading of the Bill on the subject was negatived.

THE IMPROVEMENT SCHEME

undertaken by the Council under the Housing of the Working Classes Act, 1890, in Boundary Street, Bethnal Green, has made good progress. The Clare Market scheme has received approval, as have also the Churchway (Somers Town, St. Pancras), Bell Lane (Whitechapel), Falcon Court (Borough, St. George-the-Martyr), Mill Lane (Deptford), Ann Street

(Poplar), and Brooke's Market (Holborn) schemes. Schemes have been, or are to be, undertaken by local authorities in Moira Place and Plumber's Place (Shoreditch), King John's Court (Limehouse), Norfolk Square (Islington), Brantome Place and Prospect Terrace (St. Pancras), and Fulford Street and Braddon Street (Rotherhithe). Various sites for the erection of working class dwellings have been acquired, or are proposed to be acquired, by the Council. The improvement of the northern approach to the Tower Bridge has occupied the attention of the Improvements Committee for some time. The scheme provides for the construction of a new street from Tower Hill to Prescott Street. The new street proposed will be 60ft. wide, will commence at Tower Hill at the western side of the Royal Mint (a portion of which will have to be acquired by the authorities), and will pass in a direct line to Royal Mint Street at the point where Little Prescott Street enters that thoroughfare, thence continuing in the line of Little Prescott Street to the junction of Mansell Street with Prescott Street. The plan originally submitted to the Council involved the acquisition of a portion of the Royal Mint, but that plan did not receive the sanction of H.M. Office of Works. As a result of negotiations, however, an amended scheme, involving the acquisition of a smaller portion of the Mint that was originally proposed, has been approved by the two bodies—the Council and the Office of Works.

THE AMENDED PLAN

provides for a 60ft. street, but at a cost in excess of that for the original scheme, the estimate of the net cost now being—for works, £60,000 (£40,000 of which represents the cost of necessary re-construction of the bridges carrying the railways over the new street); and for property, £156,500; giving the total of £216,500, which includes the cost of a subway along the new thoroughfare. Being of opinion that the proposed approach was an example of a county improvement, which would add an increased value to property in the locality, the Committee decided to recommend that part of the cost should be met by means of an improvement charge, on the same general principle as that embodied in the betterment sections of the London County Council (Tower Bridge Southern Approach) Act, 1895. By a recent standing order of the House of Lords the improvement area (being the limits within which the charge may be imposed) is to comprise only properties all or any part of which are within a uniform distance of any part of the centre of the new street, not exceeding three times the breadth of the street. As the new street will be 60ft. wide, this uniform distance cannot exceed 180ft. on either side of the centre of the street. The proposed street will not involve the acquisition in any one parish of twenty houses occupied by persons of the labouring class, and therefore under the standing orders of Parliament the Council will not be required to re-house the persons displaced. The proposal for the

WIDENING OF OLD STREET

at its junction with Goswell Road has become a necessity. The late Metropolitan Board, in 1872, obtained power to form a line of thoroughfare from Commercial Street to Bloomsbury, Old Street forming part of that line of communication. The widening of Old Street, however, was not carried out, notwithstanding constant petitions by the Vestry and inhabitants of St. Luke. The formation of the new line of thoroughfare between Commercial Street and Bloomsbury, has developed a heavy and continuous traffic, which has been still further increased by the continuation by the North Metropolitan Tramway Company of its Old Street lines to Gray's Inn Road and Southampton Row. At the intersection of Old Street, Clerkenwell Road, and Goswell Road, the traffic on the new line of thoroughfare is crossed by the heavy traffic to and from the north of London, the City, Smithfield Markets, and the large railway and other goods depôts in and about the neighbourhood. From a return of the

traffic it appears that upon several days some 7000 vehicles passed along the western end of Old Street between the hours of 6 a.m. and 8 p.m.; frequently as many as 700 passed in one hour. The improvement now proposed is that Old Street should be widened between Central Street and Goswell Road, and that the eastern side of Goswell Road, at its junction with Old Street as far as Willow Walk, should be set back, thus providing for a width of 60ft. instead of between 40ft. and 50ft. as at present. The estimated net cost of the improvement is £164,500, which includes the cost of constructing a sewer and a subway, and of planting trees. Powers to carry out the improvement are being sought from Parliament. The Strand

WIDENING AT HOLYWELL STREET

has also been decided upon. The chief features of the scheme are—(1) the removal of the block of buildings south of Holywell Street; (2) the provision of greater road space at one of the most crowded parts of the Strand; (3) the opening to view of several architectural features at present obscured, and the admission of light and air where most needed; and (4) the formation of a much required adequate Strand approach to the Royal Courts of Justice. The estimate of the engineer for the necessary works connected with the proposed improvement, including the paving, a subway, and the planting of trees, is £23,000; the estimate of the valuer for the acquisition of the property is £546,130; making together £569,130, which represents about one-sixth of a penny in the pound on the rates for the first year. The practical effect of the proposed expenditure upon the ratepayers in London will be that a householder rated at £40 will have to contribute 6½d. annually to the improvement; the payment would decrease annually, and be extinguished in about sixty years.

A BIT OF OLD SHEFFIELD.

THE sketch we publish on the front page is taken from a photograph kindly placed at our disposal by Mr. W. E. Davis, of Fleet Street, and illustrates a doorway of the late seventeenth or early eighteenth century which was removed from some old premises pulled down on the site of Messrs. Pawson and Brailsford's new building, near the Parish Church. It has been re-erected in the Weston Park, an example that might well be followed in other instances. The view had to be somewhat foreshortened to screen a notice board somewhat conspicuously placed just inside.

A PROPOSAL is on foot by the Holyhead Urban District Council to purchase the Waterworks from the existing Company.

New schools erected by the Sowerby Bridge School Board at Bolton Brow have recently been opened.

A RED granite drinking fountain has been presented to the Seaton (Devon) Urban District Council, in commemoration of the Queen's Jubilee, by Mr. W. H. Willans, chairman of the London Chamber of Commerce.

MR. OSCAR HARRISON, surveyor and engineer, of Workop, died last week. For two years he had filled the post of surveyor, architect, and engineer to the Workop and Retford Brewery Company, and for the five years previously was surveyor to the old Workop Local Board and the Urban District Council.

THE Wombwell New Parish Church Building Fund has reached £4606. The nave will be opened late in the autumn, and is costing £4500, but £4000 more is still wanted to complete the building. A stone pulpit, font, oak altar, brass lectern, brass candlesticks, cross and flower vases, and office books have lately been promised for the church.

By the permission of the governors, architect, and builders, a numerous party of members and friends of the Clerks of Works and Builders' Foremen Association recently paid a visit to the New General Hospital, Birmingham. The party was conducted over the building by Mr. Parsons (the clerk of works) and Mr. Randall (the foreman).

LONDON DOORHEADS.

By H. F. CARR AND H. F. WARING.

PART I.

CARVED wooden doorheads form a rapidly disappearing feature of London, and each one of the examples now remaining is a link in the chain which connects us with the past that once broken can never be re-forged; for their numbers diminish all too quickly, and the paternal provisions of the "powers that be" have banished wood for ever from any part or share in the exterior decorations of our houses. The heavier materials in which we are now compelled to build have rendered totally impossible the graceful but slenderly supported doorheads of the Queen Anne period, and have, in the form of the portico or porch, produced the monstrosities in stucco of South Kensington and Belgravia, though in more recent years terra cotta has been introduced instead, with fairly successful results, in Arundel Street, Strand, and Kensington Court, amongst other places.

The majority of the doorheads now remaining belong to the eighteenth century, and the influence of Wren may be traced in very many of them, whilst in their own particular neighbourhood many recognised and acknowledged examples of the Adam Brothers' work may be found in a very good state of preservation.

Several examples that must belong to a period earlier than the eighteenth century may be found, but specimens that may be confidently stated to be earlier than the middle of the seventeenth century are few and far between, for much good woodwork must have perished in the great fire of London, whilst the constant rebuilding that is always going on in the residential quarters of London easily accounts for the destruction of much excellent domestic work that, on more important buildings, would have been jealously preserved.

And in this connection it is interesting to note that it is in the once fashionable, but now business, quarters that the best examples of carved doorways are to be found; not that it was the custom of our forefathers to put such elaborate work on their business premises, but many men, and more especially City merchants, used at this period to live upon their business premises, which would account for the doorheads to be found in Laurence Pountney

Hill, Bartlett's Buildings, Holborn, or Great Ormond Street, Bloomsbury, whilst Buckingham Street, Strand, where once stood York House, the palatial residence of the Dukes of Buckingham, and the water-gate of which still stands at the bottom of the street, was under the name of York Buildings, the abode of Samuel Pepys from 1684 to 1700, and of Peter the Great on his visit to England in 1698. Queen Anne's Gate, another quarter of fashion, and even now a pleasant place of residence, though in the main given up to business offices, with the neighbourhood of Queen's Square and Great Ormond Street, all afford instances of how much we are indebted to the small sanitary requirements of our business men for the preservation of our forefathers' handiwork.

The work of the seventeenth century was an adaptation of classic models to modern materials and requirements. In Wren's hands this adaptation was generally ingenious, often productive of fine effects, but in most cases at

the sacrifice or mixture of the correcter features of the classic styles; for floral decorations and elaborate mouldings carved with a Renaissance character are used side by side with pillars, capitals, and pediments of a thorough classic nature.

Such development as there was during the century now under discussion tended towards a correcter and more accurate employment of the classic models adopted as the basis of the work of this period, a tendency which was immensely developed by the work of the Adam Brothers in the middle of the last, and culminated in the adoption of specific Athenian and Roman buildings as models for our West-end buildings in the present century.

The evidence available as to the dates of the examples of wooden doorways selected for illustration only enables us to place them approximately, and in many cases the extrinsic facts at our disposal are the only means we have of putting dates to examples where it is obvious they are copies of or closely adapted from previous efforts.

In the first doorway we have illustrated here, No. 11, Buckingham Street, Strand (Fig. 1),* we have an example that belongs to the end of the seventeenth century—that it was not earlier we may be sure, for according to Pepys' Diary, York House was standing on this site in 1661, whilst in 1684, as mentioned above, Pepys himself was residing in one of the new houses erected under the name of York Buildings.

The estate was sold in building plots by George Villiers, the second Duke of Buckingham, and it is extremely probable that to Wren was entrusted the designing of some of the houses, as we know, again on the authority of Pepys, that he was on intimate terms with the second Duke, for under the date of 21st March, 1668-9 of Pepys' Diary, it is recorded that it was through the influence of the duke that Wren was appointed successor of Sir John Denham as Surveyor of the King's Works.

Though we know that many of the houses in this street have been since rebuilt, yet the two examples given (Figs. 1 and 2)* are certainly earlier than the first rebuilding of this property is likely to have taken place, whilst Fig. 2, in the boldness of its mouldings, the arch in the centre, and the curious moulding rising to support it, with the Corinthian pilasters, and the bold sweep of the arch above, seems to bear the stamp of Wren's genius and characteristics.

A comparison of this example with Fig. 1, which on its own merits would appear to be of rather earlier workmanship, seems to point to a common origin; the almost identical pilasters and caps, and the similarity of the mouldings, all support the view that they are the work of

LONDON DOORHEADS. FIG. 3.

LONDON DOORHEADS. FIG. 4. SKETCHED BY H. F. WARING.

* See central illustrations.

one man, and the elaborate consols with the egg-and-tongue moulding above are features that one associates with specimens of Wren's work.

But if this be correct, and these two examples are one man's work and of similar date, then it is interesting to note how the idea of a projection or cover co-exists with the doorhead as a mere ornament, and that therefore it is impossible to make this characteristic a basis from which to trace the development of a different class of design.

In Great Ormond Street, also, we have another example of early work (Fig. 5), which may, perhaps, have been Wren's work also. The deep and elaborately carved moulding round the doorway is almost invariably associated with the early work of the eighteenth century, and occurs in two very fine doorways of a rather different character, Nos. 1 and 2, Laurence Pountney Hill, in the City, and one of these doors bears the date 1702; unfortunately, it has not been possible to include these two among the examples here illustrated; these also are examples of the projecting style of door, with concave niche in the centre, similar in character to Fig. 3, though much more elaborate in decoration.

This moulding, coupled with the flat pilasters and Ionic caps, decorated with acanthus leaves, the human head surmounting the caps and supporting elaborately carved consols, and, lastly, the bold mouldings above with the break in the centre of the frieze, are characteristics that one associates with the master mind of this period of construction and decoration.

Some of the best carvings of Great Ormond Street are attributed by Timbs (1866) to Nicholas Collet, the successor of Grinling Gibbons, and the reputed carver of Queen Anne's state coach. As the date of this craftsman's death was 1806, his work belongs to the latter part of the eighteenth century, and will be dealt with in the second part of this paper, and it is improbable that this door can have been his handiwork.

The examples of carving to be found in Queen Anne's Gate, Westminster, also belong to about the middle of this century, later than those just described but undoubtedly bearing traces of the influence of this period in the heavily carved mouldings, the use of the cupid's head in the centre and the elaborate carvings of fruit and flowers as part of the decoration (one of the features of the work of Gibbon's period). The pilasters, which support nothing, are more adroitly decorative than in our previous illustrations, yet point to the classical influence underlying all this work.

The remaining two examples illustrated in the present number are from Cheyne Row, Chelsea, and do not both appear to belong to the same period of workmanship.

The first example (Fig. 3) though very much simpler in character, has striking points of similarity with the doors on Laurence Pountney Hill. The pilasters and mouldings are entirely absent, but the consols are in good proportion to what they have to support, and the general strength and character of the mouldings give the idea of a well-designed door by some worker imbued with the spirit of the period. The other example (Fig. 4), however, shows defects where the last had merits. The consols are quite disproportionate to the size of the pediment above, a perfectly meaningless ribbed moulding is inserted round the door, whilst the unequal character of the mouldings on the lower and upper parts of the pediment suggests that the latter moulding has been boldly copied from some better example, and the whole indicates a decadence from the spirit of this period that belongs most probably to the early part of the present century.

(To be continued.)

As a county memorial of the record reign of the Queen, the inhabitants of the Isle of Wight have subscribed for the erection of a wing to the Royal Isle of Wight Infirmary for the accommodation of children. Princess Henry laid the foundation stone on Monday afternoon.

THE CONSTRUCTION OF FIVE FAMOUS DOMES.

No. I.—THE PANTHEON.

By JOHN A. MARSHALL.

A CAREFUL study of what has been termed "the most important acquisition with which Science has enriched the art of Architecture," cannot fail to prove eminently interesting and instructive.

The five examples to be considered are the most famous domes erected in Europe during a period extending, probably, from the early days of the second century to the end of the

from a circular drum enriched with the peristyle and attic.

Thus, each succeeding example is seen to be a decided advance on its predecessor, possessing some essential feature peculiar to itself, which entitles the complete structure to be regarded, not merely as the expansion of some previously recognised idea, but rather as an original work of superior genius.

The Pantheon, so simple in idea, and of such vast extent, affords peculiar facilities for the study of the principles of domical vaulting in application.

It may be premised that if a dome be built on the principle of the arch, yet the strength inherent in the former is due to qualities which the latter does not possess. Both in the dome and in the arch, of semi-circular section, the

seventeenth. Together, they constitute a progressive series, with characteristics ranging from the severe simplicity of the ancient Pantheon, to the elegant proportions of the modern St. Paul's; and, for boldness of conception, constructional skill, and grandeur of design, they are, without question, unsurpassed.

The distinctive characteristics of these examples, or types, respectively, may be summarised thus: (1) the dome in its simplest form, springing from a circular compartment; (2) the pendentive dome, springing from a square compartment; (3) the double dome, with lantern, springing from an octagonal tambour, or drum; (4) the double dome, with lantern, springing from a circular drum, elevated on pendentives, and enriched with the peristyle; and (5) the double dome, with independent support for lantern, springing

thrust is produced by the horizontal pressure at the crown threatening to force out the haunches.

But a dome, consisting of what is virtually a series of superimposed rings, possesses, in their lateral pressure, a continuity of resistance which renders the structure self-supporting at any stage of its height. Because of this quality, and also of the fact that the rings diminish in diameter, and consequently in weight, as they approach the crown, the thrust, at any given point in a dome, is less than that exerted at the corresponding point in an ordinary arch of equal span.

In a hemispherical dome of uniform thickness, the effect of the horizontal pressure at the crown—according to Tarn—is invariably greatest at a level 20 degrees from the springing; but its value, in domes of like proportions,

THE PANTHEON - ROME

varies as the cube of the diameter or span. Thus, if the span be doubled, the thrust will be increased eightfold; but by a gradual decrease of the thickness upward, whereby the weight, and consequently the pressure, at the crown are reduced, it is evident that the thrust may be considerably diminished; or, what is practically the same, it may be counteracted by piling around the haunches an extraneous mass of material, sufficient by its sheer weight to effectually withstand the force of the pressure.

To clearly understand the conditions on which a dome depends for its stability, a brief examination of the supporting structure should first be made. In the Pantheon this is a rotunda, the form most conducive to strength. Its internal diameter is 142ft. 6in., and the height, from the floor to the springing of the dome, is 72ft. Its wall has a total thickness of 21ft.; but the expedients adopted for securing strength, combined with economy in the use of material, reduce the supports to little more than eight hollow piers, placed at regular intervals. A connecting wall, about 9ft. in thickness, forms a continuous curve on the exterior, leaving in the interior a series of deep recesses, which are vaulted just under the springing of the dome, so as to transmit the superincumbent weight to the piers.

The voids in the piers are semi-circular on plan, with the curve towards the interior of the edifice; while further strength is secured by two tiers of semi-domical vaulting.

The inner surface of the dome is not quite hemispherical, the centre being about 10ft. below the springing. From the springing level to the height of 28ft. the haunches are girt with an abutment story, raised on the rotunda, the disposition on plan of the solids and voids, as well as the system of vaulting, being somewhat similar to that in the wall below. In the interior spaces are transverse walls, 3ft. thick, connecting the inner and the outer walls, thus providing a more continuous abutment, while still observing economy in the use of material.

The dome is also weighted with a solid mass, which rests on the abutment story and rises in a series of steps to about two-thirds of the height. From this level the outline follows the curve of the interior. At the crown is a circular aperture, or eye, 28ft. in diameter, this being the sole provision for light into the building.

From the foregoing description it will be seen that the builders of the Pantheon were thoroughly acquainted with the nature of the forces with which they had to deal. But the extreme extent to which they have applied abutment seems also to afford evidence of a

desire, not only to meet all statical requirements, but also to give to the rotunda a greater elevation externally. With this two-fold object, they maintained the full thickness of the supporting wall to the level of the weakest point of the dome, i.e., to fully one-third of its height, thus virtually making that portion, with its massive encasement, a part of the supporting structure, and practically reducing the span from 142ft. to 120ft.

In the next stage, the peculiar disposition of the material may be said to impart to the dome the constructional nature of a cone. The thickness here commences at 15ft., and rapidly diminishes, until, at a point where the diameter is 80ft., it is only 4ft., at which it is maintained to within 14ft. of the crown, and, by the omission of the remaining portion, the principle underlying the abutment system may be said to be carried to its utmost limit.

Respecting the internal construction of the dome, but little was known with certainty until M. Chedanne, in 1892, surprised the archaeological world by the results of his investigations. The theory of a simple framework of converging and horizontal ribs of brick, inclosing panels of concrete, and which had been taken to be indicated by the arrangement of the coffers, is now untenable. Neither has the more elaborate method propounded by Viollet-le-Duc, viz., a network of arches, resting on an inner system of ribs, any existence in fact. Even the evidence of Piranesi, who repaired the dome in 1743, appears to be not altogether reliable, although he agrees with M. Chedanne in showing a range of large arches at the springing of the dome over the main recesses of the rotunda.

From a report prepared by M. Chedanne, and read by Mr. R. Phené Spiers before the Royal Institute of British Architects, 1895, it would seem that these arches coincide with the vaulting of the abutment story. Their purpose is evidently to relieve the discharging arches below by concentrating the weight on the piers. They do not, however, as they rise, follow the contour of the dome, but are vertical; and although, from this fact, it is obvious that their construction would be simplified, yet the inner face of the dome is thus deprived of their direct support. It was probably to remedy this that the three smaller arches were inserted, and made to follow the contour of the dome; these have been built in to accord with the design of the coffers, and not cut afterwards, as might have been supposed.

M. Chedanne was not able to examine the construction of the upper part of the dome from the level of the fourth range of coffers, but he thinks there may be a series of arches above that level.

The rotunda—which rests on a basement, or podium, of travertine—is built entirely of brick. The tiles forming the core are irregular in shape, bedded in mortar, and grouted occasionally. Layers of tiles, 2ft. square, are introduced at intervals, to give bond, and probably serve a useful purpose in breaking the homogeneity of the mass. The walls are carefully faced with tiles, to which was originally affixed a casing of marble; that of the interior, however, only remain.

With the exception of the arches above mentioned, the dome is a mass of superimposed layers of brickwork, as in the rotunda,

without constructional radiating ribs; and thrust is entirely obviated, not only by the nature of the abutment, but by bedding the tiles with a slight downward inclination towards the exterior, a method which would allow of the dome being constructed for a considerable height, without the aid of continuous centering.

The coffers answer the two-fold purpose of adorning the vault and diminishing its weight, and the ingenious modification of the upper and lower members of each coffer, so as to obviate the effects of foreshortening as seen from below, should not be overlooked.

Both the exterior and the interior of the dome, it is believed, had originally a covering of bronze, of which remnants may still be seen in the cornice around the central opening, and in the cramps inserted in the middle of each coffer, and on the ribs.

The exterior is now covered with lead.

It may be mentioned that the main constructional lines of the interior of the rotunda are masked by the architectural decoration. This peculiarity is not, however, to be regarded as an indication of later work; for, considering the accurate disposition of the various small relieving arches—both in the dome and in the rotunda—over the columns below, it is evident that the marble enrichments form an integral part of the original design.

The manner in which the arches of the Pantheon are turned is deserving of notice. The haunches are generally formed in one deep rim, while the upper portion is turned in two or three rims, the lowermost of which would serve as a centre on which to turn the rest, thus relieving the wooden centering of that portion of the weight which would otherwise have borne most heavily on it until the completion of the crown.

The late Mr. Middleton has observed that the arches which appear outside the rotunda pass into the wall only to the depth of a tile or so. This singularity occurs in other buildings, but has not, we believe, been satisfactorily accounted for. In vaulting the hemispherical niches of the rotunda, one or two layers of large tiles, laid flat, were first turned on light centering to the contour of the vault; the filling-in was then laid directly on this. Sometimes, in the case of barrel vaults—as at the baths of Caracalla—a skin of tiling is found, over which are turned brick rims in the ordinary way. This latter method may also apply to the barrel vaults of the Pantheon, as shown in the sketch from M. Choisy.

Whether intentional or not, it is evident that the system of construction generally adopted imparts to the structure a moderate degree of elasticity, and to which perhaps it is mainly owing that, while some other domes have been seriously fractured, that of the Pantheon has successfully withstood the numerous seismic shocks to which it has, in common with others, been exposed, and remains to this day the best preserved monument of ancient Rome.

HISTORICAL SKETCH.—Materials for a history of the Pantheon are extremely scanty. The inscription on the frieze of the portico states that the latter was erected by Agrippa—consul in the time of Augustus—27 B.C. This portion formed part of a temple dedicated to Jupiter Ultor; but from inscriptions stamped on the tiles used throughout the rotunda, it appears to be conclusively proved that the dome, with its supporting structure, cannot be earlier than the second century A.D.

The probable history is that the original rectangular cella of Agrippa's temple having been destroyed by fire, the rotunda was erected in its place by Hadrian, who retained the portico; and that in the time of Septimius Severus, A.D. 139, the portico was taken down and rebuilt, with certain modifications, on a higher level, the floor of the rotunda being 6ft. above the original level of Agrippa's temple.

In A.D. 608 Pope Boniface obtained from the Emperor Phocas permission to consecrate the building as a Christian church, and to this circumstance chiefly may be attributed its excellent preservation.

Having been previously abandoned, it probably passed into the hands of the Christians with but little alteration.

POSITION OF THE WELSH TINPLATE TRADE.

FOR the last seven years the Welsh tinplate industry has called forth the special attention of politicians, business-men, employers, and workmen. This erstwhile Welsh prosperous industry excited the enterprising ambitious American, who was our chief customer, to an effort to establish tinplate making as one of the industries of his own land. To accomplish that in an ordinary way was impossible, for Welsh tinplates were placed in America at a price that made it impossible for the American manufacturer to produce them. A successful appeal was made to the legislature to establish a high tariff. This has varied from 1891, when it was embodied in what was known as the McKinley Bill, from 2 cents per lb., to the recently passed Dingley Bill, in which it is set at 1½ cents. per lb. To thoroughly realise how prohibitive this tariff is, it must be compared with the value of tinplates in Wales. At present a box of 108lb. C. 20 by 14 will be delivered at Swansea at 9s. 6d.; a tariff of 1½ cents. per lb. works out at 6s. 9d.; so that the tariff imposed amounts to

OVER TWO-THIRDS THE VALUE

of the Welsh article. Again, much discussion has taken place about reducing wages to meet this competition by tariff. The suggestion becomes preposterous when it is known that the total sum per box paid the Welsh tinplate worker is 1s. 8d. per box. The result of the imposition of this high tariff has been to exclude Welsh plates from entering American ports except in the case as provided by the Dingley law, that a rebate of 99 per cent. is allowed on all tinplates used as canis or packages for exportation. The effect of the American tariff is seen from the following figures supplied by the Board of Trade:—In 1892 we exported to America 276,469 tons; 1893, 255,628 tons; 1894, 227,879 tons; 1895, 222,901 tons; 1896, 113,051 tons.

THE REDUCTION IN PRICES

has not been less remarkable. In 1892 the price of a box of plates, Siemen's steel, would be 12s. 9d.; in 1897 it is only 9s. 6d. The Americans are not using less plates than formerly, but now they supply their own requirements, and this is done at thirty-nine concerns with 200 mills. The great loss of trade indicated by the above figures has produced much loss of capital and a great deal of misery in Wales. In 1892 we had 500 mills at work; to-day but 270 mills. Some works which in 1892 were of considerable value are practically valueless to-day. Hundreds of men who used to get their living at tinplate works have become colliers, and others have found other means of earning a living. However, it is fairly safe to assert that the Welsh trade has received its worst blow, and it is an undoubted fact that the great attention called to tinplates has done a great deal to increase consumption, for people have of late found use for the steel sheet and tinplate for purposes not dreamt of a little while ago. The result is that, whilst losing the American trade, the trade with other countries has rapidly increased. In this connection the figures of the Board of Trade for the last seven months supply

REMARKABLE EVIDENCE.

For the first seven months of 1896 was sent to the United States 73,552 tons; in the seven months of 1897, only 56,564 tons; showing a loss in trade of 16,988 tons. To other countries was sent, in 1896, 87,116 tons; in 1897, 110,696 tons of tinned plate; thus making up not alone the loss of 16,988 tons to the States; but over and above that an increase of 6592 tons of tinned plates. But this is not all, for a large increased export of black plates to other countries than America is recorded. In the seven months of 1896 was exported 2356 tons of black plate to the United States; in 1895 for the same period only 406 tons; to other countries in 1896 24,979 tons; whilst in 1897, 33,801 tons were

exported, or an increase of 8812 tons of black plates, which, with the increase of 6592 tons of tinned plates, makes a total increase for the seven months of this year of 15,404 tons, or, in other words, the work of twenty mills. It is these figures, doubtless, that influenced Sir John Jones Jenkins to say that in eight years there would be made up in the Welsh tinplate trade its loss of the American market. As far as can be ascertained, the mills going in Wales just now are

NOT SUFFICIENT TO MEET THE DEMAND,

except on the supposition that instead of thirty-six boxes per shift some forty-six boxes are made, and that average is certainly not reached. A change must evidently soon come about in the present unsatisfactory position, according to which excellently-situated works cease to produce rather than sell at a loss. At present works having 270 mills are reported as going, but at some of these works mills are idle. Stocks are low in other places than Swansea, whilst here, the chief shipping port, there is found much to indicate that scarcity of tinplates is not far off. On August 14th the stocks of Swansea were 162,208 boxes; August 21st, 111,615; and last Saturday week only 86,998 boxes, the lowest stocks on record since the great clearance after the McKinley boom. In view of these facts, it is surprising that tinplate makers are not able to secure better prices. Some of their number do not hesitate to say that it is entirely their own fault. There is no doubt whatever that orders have lately been withheld or only offered at prices that will discount the anticipated downfall of wage rates. Seemingly, buyers are likely to be disappointed, for it is beyond doubt that there are men among the workmen who read the signs of the times, and it must be said that the way the tinplate worker has fought for his list during the last six months leaves but faint hope that he is going to give up now when on the eve of seeing altered conditions.

The demolition of Hornsea Pier has been commenced, by order of the purchasers, Messrs. Ellis, Tattersall, and Co., of Manchester.

The Bishop of London has consented to open the New Technical and Art School at Leicester on October 5, which is now being completed in the Newarkes at a cost of about £40,000.

The freehold property known as Avondale Hotel and Hatchett's Restaurant, Piccadilly, was recently sold by Messrs. Douglas Young and Co., by private treaty. The price was £127,000.

The tender of the Imperial Wood Pavement Company, 46, Queen Victoria Street, has been accepted by the St. George's Vestry, W., for the laying down of about 25,000 yards of wood pavement.

ST. GEORGE'S CATHEDRAL, Southwark, the largest Roman Catholic Church in the metropolis, is to be further enriched by a new stained-glass window, as a memorial of Dr. Coffin, third bishop of the diocese.

The Leeds Corporation Markets Committee has decided to ask the City Council to grant £2000 for the purpose of lighting by electricity that portion of Vicar's Croft which is being covered in as part of the markets.

A PETITION has been numerously signed against the laying down of asphalt in Victoria Street. The petitioners aver that the "sweep" leading into Victoria Station should be paved with wood, otherwise there must necessarily be numerous accidents, especially during the winter months or after a slight shower of rain.

The Sanitary Institute, which is now holding its annual congress, asked the Leeds Corporation to help to modify the expense that will be entailed by illuminating the Health Exhibit on, which is to be an important item in the programme, without charge. As the request included the erection of gasfittings and a free supply of gas in a large building for nearly a month, the Gas Committee, at a recent meeting, unanimously expressed regret that it did not feel justified in acceding to the proposal.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
September 15th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

It is probable that, in view of the many improvements which are taking place in connection with the new Admiralty Buildings in Spring Gardens, the old and historic chapel at the corner of New Street will, ere long, become a thing of the past. The building, which is now used by the Admiralty authorities as a Government office, has been styled a chapel-of-ease to the parish of St. Martin-in-the-Fields. It occupies the site of the old Spring Gardens Chapel, where a number of French Huguenot refugees settled in the reign of William III. This building, together with the Thatched House Tavern adjoining, was destroyed by fire in 1726. Five years later a new chapel was built by the Hon. Edward Southwell, and subsequently the present one was erected by a member of the De Clifford family.

THE restoration of the north gable of the west front of Peterborough Cathedral has been completed. Those portions of the great arch, and of the gable above it, which have been taken down and rebuilt contained in all 2006 facing stones; of these 170 only were found so decayed that they had to be replaced by new ones, and the remaining 1836 have been put back again into their original positions. The central and southern gables, portions of which are in a very dangerous condition, will next be dealt with.

NEWLYN must look to its laurels. As one of the principal haunts of artists outside the "forty" it has long since been famed, but even the scenery of this charming west country village must become monotonous after a time, and the "Newlyn School" is threatened. A rival has arisen, a dangerous beauty, too, whose charms have all the piquancy and freshness of the very latest *débutante*. Brixham, that picturesque, but little known fishing village on the shores of Torbay, is this year being besieged by geni of the brush, and many an ambitious artist has had to turn sorrowfully away owing to lack of accommodation. Next year's exhibition at Burlington House will be strong in landscapes and seascapes from round and about this historic town, and Brixham's position as an artistic centre will probably be assured.

TURNER's well-known house at Twickenham will be brought under the hammer towards the end of the month. The property came into the possession of the famous landscape painter about 1813, when, tired of an exclusively town life, he sought a retreat in a handy situation to which he could retire when the worries of his profession or the exigency of social callers made his residence in Queen Anne Street intolerable to him. At the time that Turner purchased the little place there was a small house upon it; but, being dissatisfied with this, he designed the existing building, which he at first called Solus Lodge, but which was subsequently known as Sandycroft Lodge. The artist during his sojourn at Twickenham painted his "Thames at Kingston Bank" and

the well-known picture of Richmond Hill, as well as many other works of less note. Mr. Ruskin is very severe upon these productions. He refers to them as "Vulgaries which may perhaps be best expressed by the general term 'Twickenham Classicism,' as consisting principally in conceptions of ancient and of rural life such as have influenced the erection of most of our suburban villas." The contemptuous estimate is very far from being upheld by the bulk of art critics, who place a high value upon the work of the Twickenham period.

GENERAL interest seems to have been excited in Yorkshire by the alleged destruction of the identity of Scarborough Castle Hill by the scarping down of its beetling crags for the purpose of making a road round the base. It is, however, fully recognised that the work is absolutely essential for the preservation of the hill itself, and, moreover, of the proposed road, which might at any time be at least partially destroyed, to say nothing of any contingent loss of life by the collapse of the overhanging portions. A serious slip of the nature which the work is designed to prevent took place on Aug. 24, 1890. Another alteration in the appearance of the cliffs, the proposed erection of a revolving tower on the same lines as that at Yarmouth is also provoking hostile criticism, on the ground that Scarborough has already sufficient natural points of vantage for observation without the erection of such a structure.

THE Earl of Londesborough, in protesting against the embankment scheme at Scarborough, says: "The north face of Castle Hill is irretrievably ruined, but I hope that if the attention of the public is promptly called to this vandalism further progress in the work of destruction may be stopped, and what still remains of the Castle Hill be preserved. As a young man I represented Scarborough in Parliament, and it does grieve me to see the grand old cliff ruined from the mistaken idea that visitors will care to drive along the foot of a stony slope and pay for the privilege of doing so. In other places they subscribe handsomely to preserve their ancient monuments, but Scarborough will have to pay probably £100,000 to destroy her greatest attraction."

SUNDERLAND, of late years, has been noted for its rapid expansion and architectural developments. Improvements in commercial properties are now considered essential in the Wearside Borough; consequently, the old business places are fast disappearing, and more palatial ones are being reared in their stead. Not only is this the case on the south side of the river, where most of the business is concentrated, but it is equally manifest in the parish of Monkwearmouth across the bridge. During the last few days one of the best-known hosteleries in this ancient part of the town has been in course of demolition in order to rebuild one of larger dimensions and importance. This relic of the past was more than 200 years old. The house referred to is the old Wheatsheaf Inn at the west end of Roker Avenue, and on a line with Newcastle Road. This inn did a large business in the days when the coaches were running between the Wear and the Tyne. The coaches made a halt at the 'Sheaf after leaving the George and the Golden Lion Inns, and crossing the camel-back bridge, as it was then, with an extra horse. The new building to be erected on the site of the old one will be in every way adapted to meet the requirements of the district in which it is situated, with extensive cellarage and modern hotel accommodation.

SOUTH KENSINGTON has for some time been introducing wood-paved roads, and as some conflict of opinion has arisen as to the relative merits of the cubes and asphalt, it may be interesting to state the experience in this district. When it was decided to do away with the macadam surface, which was found to be very costly to maintain under the conditions of a constantly increasing traffic, the Surveyor to the vestry of St. Mary Abbot's

made a special report, in which he pointed out: "The general information which I possess enables me to state that at present prices it is advisable, as a matter of economical road maintenance, to pave with 5in. creosoted wood blocks any macadam road now costing 1s. per yard per annum to maintain, irrespective of cost of scavenging, and, further, I am of opinion that it would be sound parochial economy to lower such standard of conversion to 10d., as the general beneficial result to the district at large would, in my judgment, more than counter-balance the 2d. per yard loss on the actual cost of maintaining the particular road." Acting on this recommendation, a large sum of money was spent by the Vestry, and it is satisfactory to know that the result is quite up to the anticipation. In the last report of the local authority the surveyor expresses the conviction that "a wood-paved road surface will last equally long without repaving, whether it is paved with blocks 5in. or 6in. in depth, as the renewal is necessitated, not by the blocks being worn out, but by the curvature of the surface wearing down below the level at which the surface water will run to the side channels. Still shallower creosoted deal blocks, viz., 4in. deep, are under trial in Sydney Place, South Kensington, having been laid down in November, 1889, and at the present time are in good condition, and have not been patched or repaired."

A LITERARY landmark of South Devon will disappear this autumn. This is that charming old inn, the Ferry Boat, at Coombe Cellars, on the banks of the River Teign, between Teignmouth and Newton Abbot. Built of Devonshire "cob" walls, and picturesquely thatched, it has for many years past been a place of pilgrimage for boating parties on picnics intent. Some few years since Mr. S. Baring-Gould, the author of that well-known novel "Mehalah," made Coombe Cellars the scene of another novel, "Kitty Alone." It is, indeed, a place well suited for literary and romantic treatment, being placed on a little promontory of that broad sea-salt estuary of the Teign, surrounded with sturdy sea walls, and commanding impressive views of the southern town of Dartmoor. All who know Coombe Cellars will learn with regret that it has been decided to rebuild this quaint old inn.

It is very gratifying to see that the main portion of Mr. Tate's noble scheme has no sooner been thrown open than the next has been commenced. Excavators are now busily at work preparing for the foundations of the extension, which will comprise even more gallery space than the existing building. It will occupy somewhere about the same extent of ground, but as there will be no vestibule, &c., the whole of the ground will be available for galleries, of which there will be nine, in addition to a studio and restoring room. The new portion will extend out at the back of the present building, and corridors will run through from the central hall.

THERE never was, probably, a place richer in Roman remains than the City of London, a fact which is emphasized at all periods of the year during the work of excavation in the public streets or within the confines of private property. Not long since some workmen were excavating for building purposes in Queen Victoria Street, near the corner of Walbrook, and at a depth of 26ft. a shovel unearthed a little collection of Roman remains, which have since found a permanent resting-place in the Guildhall Museum. The "find" consists of a Lagena, a bronze balance, and a large iron nail. The Lagena is a gracefully formed, two-handled vase of fine buff ware, about 8in. high by 7in. at its greatest diameter. The neck is simply ornamented with two parallel grooves, and a single groove runs down the centre of each handle. Equally interesting is the large iron nail, which measures from the point to the top of its large conical head 12½in., the head being 2in. in diameter. Such nails were used in buildings to fasten beams and large timbers, of which the houses of ancient London were, of course, formerly constructed. The

balance, or *libra*, is made of bright yellow bronze, and is about 14in. in length. At each end of the beam is a double hook, from which the articles to be weighed were suspended, while at the centre is a small loop for the *ansa*, or handle. One half of the beam is divided into fractional parts, like a steelyard, so that by means of a sliding weight, which is unfortunately wanting in this specimen, the difference between two articles could be arrived at without employing a number of fractional weights.

It having been announced that Professor Church is to "restore" the two great stereo-chrome wall-paintings by Maclise—the Nelson and Wellington—in the Royal Gallery of Westminster Palace, we are asked to state that further "cleaning" of those great pictures is all that he has undertaken. No re-painting or restoration will be attempted, nor, indeed, is such treatment required. A preservative solution will probably be applied to one or both of the pictures, the work being carried out next month. Four of the glazed corridor paintings will also receive attention.

WYCH STREET is a very old thoroughfare. In the olden days it formed part of a lane leading from the north side of the Strand to Broad Street, St. Giles, and was designated the *Via de Aldwych*, which was in more modern, but still ancient, days colloquially shortened into "Wych," and the familiar "street" substituted for the "via." Some of the houses erected in its more prosperous days still remain; but it will not be long before they are all cleared away. They would probably not have been standing now if it had not been certain that great improvements would sooner or later take place in the neighbourhood, their owners being consequently willing to wait the course of events. Some of these improvements are at last to be carried out, and in the next twelve months the south side of Holywell Street, which runs parallel to Wych Street, will be pulled down. The change will affect the whole neighbourhood.

SOME important additions have recently been made to the Egyptian sculpture gallery of the British Museum. Among the most important is a very fine limestone figure of a man, who, according to the inscription, was called *Nekht-Amsu*. He appears to have been a scribe attached to one of the temples, possibly to that of Ra at Heliopolis. He is represented kneeling, holding a tablet in front of him, inscribed with a beautiful prayer to the Sun god. Above the inscription is the disc of the sun in a boat in front of which *Nekht-Amsu* is represented in an attitude of adoration. The age is possibly about B.C. 1500. There is also a statue of a man called *Ka-mes*, who would seem to have been a keeper of the sacred cattle of the god Amen. The inscription on this is well cut, and may be read with ease. Specimens of the work of later artists of the Ptolomaic period have also been exhibited. Among these the best is probably the statue of a king, represented walking with his hands by his side, according to the custom of the period.

THE third annual report to the Secretary for Scotland by the Commissioners and Trustees of the Board of Manufacturers in Scotland as to their proceedings in regard to the National Gallery, School of Art, Museum of Antiquities, and other buildings and establishments under their charge, for the year ending September 30th, 1896, has been issued as a Parliamentary paper. It states that the number of visitors to the National Gallery had decreased as compared with the preceding year by 4379. The portrait of Mrs. Kinloch, of Gourdie, by Gainsborough, had been added to the collection. The returns for the School of Art for the year showed a total decrease in the number of students of thirty-nine. The portraits added to the collection during the year had been: by bequest or in gift, ten portraits; and by purchase, three portraits. The Commissioners report that Mr. John Ritchie Findlay, one of the Commissioners of the Board, to whose liberality the erection of the

Scottish National Portrait Gallery buildings is due, has presented to the Board the sum of £10,000 for the decoration and ornamentation of the interior and exterior of these buildings, on condition that a well-considered general scheme is matured under the direction of the Commissioners, and that the entire sum be expended within ten years from the date of the gift. During the year there was completed and presented to the Commissioners of the Board, in trust for the nation, by Miss Mair, on behalf of a committee of Edinburgh ladies, a group of portrait statues, representing Mary, Queen of Scots, Maitland of Lethington, and Leslie, Bishop of Ross. This group now occupies the large niche on the east gable of the buildings.

At the rear of Inigo Jones's banqueting house the fine bronze statue of James II., which has stood for over 200 years in the comparative obscurity of Whitehall Gardens, has just been removed to a more public position in the garden adjoining Gwydyr House, Whitehall, now occupied by the Charity Commissioners. The statue, which is draped in Roman garments, once thought absolutely essential to dignity and high Art, is one of the best pieces of sculpture to be seen in London, and well merits the wider range of admiration which its new position will bring it. It is curious that there should always have been a certain degree of doubt as to the authorship of so fine a piece of work, generally attributed to Grinling Gibbons. In Peck's "*Desiderata Curiosa*" (vol. ii., p. 50) is a list of the various benefactions of Tobias Rustat, Esq., "a very simple, ignorant, but honest and loyal creature" (says Evelyn), who was page of the back staircase and keeper of Hampton Court. The list includes this entry: "A free gift to their majesties, King Charles II. and King James II., of their statues in brass; the former at Chelsea, the other at Whitehall—£1000." Walpole tells us that "Vertue met with an agreement, signed by Gibbons himself, for a statue of James II., the price £300, half to be paid down on signing the agreement, £50 more at the end of three months, and the rest when the statue should be completed and erected. Annexed were receipts for the first £200, Aug. 11, 1687. The paymaster, Tobias Rustat." Dallaway, in a note on this passage, suggested that Vertue had made a mistake in the name, and had copied James II. for Charles II. Nevertheless, he was inclined to attribute the statue at Whitehall to Gibbons, because he knew of no other artist of that time capable of it. Dallaway was apparently unacquainted with the note in Peck, and also the following, which occurs in the "Autobiography of Sir John Bramston" printed for the Camden Society: "On New Year's Day (1686-7) a statue in brass was to be seen (placed the day before) in the yard at Whitehall, made by Gibbons, at the charge of Toby Rustick, of the present king, James the 2nd." Sir John probably ante-dated the event a year or so, but he speaks of it as a matter of contemporary knowledge, and verifies the note of Vertue on which Dallaway had thrown doubt. The late site of the statue is one of the quietest spots in all London, although, 20yds. off, vehicles of every description stream up and down all day long, and continual crowds of people throng the pavements. The old house which forms part of the Board of Trade offices, half smothered with virginian creeper, and its forecourt bright with beds of flowers, is probably destined to come down at no distant date in connection with the building of the new War Office.

THE excavations that are being carried out near the Casino, at Baden-by-Zurich, have brought to light many relics of the time when this district was the great *entrepôt* of the Roman army in Transalpine Switzerland. Interest was first aroused by the discovery of the site of an old Roman military hospital, in the interior of which were found various surgical instruments. Within the last few days, however, a still more valuable "find" has been made in the shape of a villa, which, judging by the treasures already exhumed, must have belonged to some wealthy and art-loving Roman.

CONSIDERING that they are both inhabited by an English and English-speaking race, and are not very dissimilar climatically, no two cities in the world, probably, differ so much as London and New York. Even Paris and London, or Berlin and London, although not peopled with men who speak the same language, have more points in common than London and New York. In the latter city nearly everything seems to be done on an entirely different plan from that which obtains here. London's buildings, unless they are newly built, all have a grimy appearance; the buildings of New York, put up a hundred years ago—there are several on the east side—are as clean as when built. This is owing to the fact that a coal similar to anthracite is burnt; consequently the atmosphere does not become choked with soot, and fogs are unknown. London, again, has its Metropolitan railroad underground; New York has it—or, rather, them, for there are several—overhead. And this brings us to another point. The city on Manhattan Island is about as noisy a one as can well be found. One reason for this is the overhead railroad, the clatter of which is deafening. Another reason is the shocking condition of the roads. Broadway is more or less reasonable, but some of the Avenues—Eleventh and Avenue B, for example—are in such a state that, after a rainstorm, one may step into a puddle eight inches deep in the middle of the road. This, of course, makes the traffic more noisy than it otherwise would be, and as all the roads practically are paved with cobbles, the noise when the traffic is in full swing, and a train is passing over one's head, is more like the riveting room of a big works than anything else. The trams have stoves in them during the cold weather. Why should not this plan be adopted in England? The extra expenses would be but very small. In the summer these cars are not used, but instead they bring out open trams, built on the principle of our garden-seat omnibuses—a vast improvement on the conveyances in vogue here. None of the trams, however, are built so that passengers could ride on the top; but there is a reason for this, and that reason is the overhead railway.

THE report that a plan has been formulated for enlarging Billingsgate Market by means of a floating covered way, extending the whole length of the Customs House Quay, and of sufficient width to give an addition of four times the size of the present site, appears to be somewhat exaggerated. It would appear that the accommodation afforded by the two floating pontoons moored alongside the river front of the market for the purpose of landing the cargoes of incoming fishing boats is insufficient, owing to the increase in the quantity of fish sent to the market. All the Corporation has decided to do is to make two new pontoons outside the Customs House Quay.

MESSRS. KEGAN PAUL, TRENCH, TRUBNER, AND CO. will shortly publish the text of the valuable Coptic Psalter discovered about two years ago in Upper Egypt, and now issued under the editorship of Dr. Wallis Budge, of the British Museum. This unique manuscript was found by Egyptian peasants in the ruins of an ancient Coptic monastery, enclosed in a stone box, which had been firmly fastened into the ground. It was clearly prepared for the use of the Monastery, and hidden in some moment of peril, and its discovery bids fair to rank among the greatest of the great "finds" which have been made in Egypt during the last ten years. When the volume reached England the binding could only be opened with difficulty, and the papyrus leaves were brittle. Dr. Budge, therefore, lost no time in transcribing the manuscript, and the text is now printed page for page and line for line with the original. The Coptic Psalter is in papyrus MS. of 156 leaves, measuring 11½in. by 8½in. The quires are twenty in number, and are signed with letters. All the pages were originally numbered with letters, one column of text containing thirty-one or thirty-two lines occupying each page. The handwriting is fine and bold, but careful, and there is no

coloured ornament. It should be noticed also that the manuscript contains the spurious 151st Psalm—a rare and interesting inclusion.

It is not often that monuments to illustrious Frenchmen take so practical a form as that which has just been inaugurated amidst the desolate rocks of Penmarc'h, on the Breton coast. Some little time ago Mme. de Blocqueville, a daughter of Marshal Dayoust, Duke of Auerstadt, left the sum of £12,000 sterling to perpetuate her father's memory by the construction of a lighthouse. The Government approved of so excellent an idea, especially as at that moment the Penmarc'h light was getting obsolete, and trebled the amount of the lady's legacy in erecting the lighthouse. This is now the most powerful beacon that France possesses, quite outdoing the Heve light. Its electrical illumination is stated to be of ten million candle power, and, placed more than 180ft. above the sea, it is visible at a distance of sixty miles. On the summit under a canopy stands the statue of the great soldier looking forth over the wide waste of water.

MR. PERCY FITZGERALD writes:—"There is not much to note in old public-houses: they are common—too common, though sometimes picturesque when by the roadside; but with the Derby Street 'Red Lion' is associated a rather pathetic passage in the early childhood of the young, struggling 'Boz.' I can never pass it without the scene, now some eighty years old, rising up before me—particularly as it has been described by him twice over in the most vivid fashion—once in his painful little 'Autobiography,' and later in his 'David Copperfield.' He was such a little fellow—with his poor white hat, little jacket, and corduroy trousers—that frequently when he went into a public-house for a glass of ale they didn't like to give it to him. "I remember one evening that I went into a public-house in Parliament Street, which is still there (1847) though altered, at the corner of the short street leading into Cannon Row, and said to the landlord behind the bar: 'What is your very best—the very best—ale a glass?' 'Twopence,' says he. 'Then,' says I, 'just draw me a glass of that, if you please, with a good head to it.'" The landlord looked at the poor child with a strange smile. He said something to his wife, who came out from behind the bar with her work in her hand, 'and joined him surveying me. Here we stand all three before me now, in my study in Devonshire Terrace.' They asked him many questions, to all of which 'that I might commit nobody I invented appropriate answers. They served me with the ale, though I suspect it was not the strongest on the premises, and the landlord's wife, opening the little half-door and, bending down, gave me a kiss that was half-admiring, half-compassionate, but all womanly and good I am sure.' A picture really worthy of the 'Sentimental Journey.' The passage in 'Copperfield' repeats the story, if not in the same words, at least in the same spirit. The house is somewhat altered; but we can still recognise the back parlour whence the good-natured landlady came out to look at him. Let us hope that no spirit of vaulting ambition will lead its proprietor into wholesale altering or rebuilding, and that he will cherish the memory of little 'Boz's' glass of ale. Members of Parliament, as they hurry down Parliament Street to 'the House,' regularly pass an old-fashioned public-house—in form and general aspect rather gone-by, like the clothes of an old club member of the forties, but striving to keep up with the times. It stands at the corner of Derby Street, facing a club, and is called the Red Lion. The noble beast, spiritedly carved, is prancing rampant over the doorway."

The experience of several years past has made it very well understood in the reading-room of the British Museum that for purposes of study the length of the day is deceased with its natural increment, and conversely. The end of August, for instance, coincided with the close of the fourth month, dating from the beginning of May, during which the reading-

room has been open not later than seven o'clock in the evening. This period covers, of course, the months during which it can be kept open with practical advantage, without having recourse to artificial illumination, leaving the eight months' period of shorter days, from September to April, both inclusive, to be eked out by the electric light until they become an hour longer than those of the long days of summer and sunshine. Ever since the most valuable introduction of electricity for the purpose of lighting the reading-room, the authorities have constantly been on the *qui vive* to discover how the service could be improved, and various devices have been adopted for the attainment of a greater efficiency. The lighting was originally effected by five large globes pendent from the roof, which five or six years ago, whilst somewhat diminished in size, were increased in stability, and were supplemented by a system of incandescent lights so arranged that the direct advantage of one of them accrued to each individual reader. A year or two ago a further service of incandescent lights was arranged, by means of which the titles of books on the shelves running round the room, and up to that time directly under the shadow of the projecting galleries, were clearly discernible. The opening of the present electric season is distinguished by another addition to the facilities of study—this time as applied to the catalogues and bibliographical and other works which occupy the inner and outer desks which form the concentric outworks of the heart of the reading-room.

ONCE more the question is being raised of the advisability of constructing a new lock on the Thames at or near Putney. The proposal on this occasion comes from a body styled the Thames Improvement Committee, which has just issued a report wherein the results of investigations made during the past summer are set forth. In this document some striking facts are given demonstrating the importance of the new work, and showing what beneficial results would follow from its execution. Unquestionably a scheme like this, which would do away with the unsightly mud banks about Putney and Hammersmith, and give a magnificent open stretch of water at all times, has much in its favour. But experts are not quite agreed that the river could be impounded at Wandsworth without serious detriment further down. It has been found that the construction of the weir and lock at Richmond has had the effect of so materially reducing the level of the water immediately below that place as to make navigation at certain states of the tide almost impossible. This has caused considerable inconvenience, and it has also given rise to grave misgivings as to the sanitary consequences likely to flow from the undue depletion of the channel. To construct a new lock below Putney, it is believed, would be to reproduce the evil in an intensified form in the important part of the river which flows between London Bridge and Wandsworth.

To the number of statues of living persons may be added that of the Prince of Wales, on the Temple Bar Memorial. There is, however, a ludicrous effigy of the Prince to be seen, in stained glass, in Plymouth Guildhall. That building was completed in 1874, and the chief feature of the Great Hall is a very fine series of stained-glass windows, in which is set forth the history of Plymouth, ending with a representation of the opening of the Guildhall by the Prince, who appears in the midst of a crowd of notables, silk hat on head, with black frock coat and lavender trousers. Stained glass is so entirely antipathetic to the presentation of modern costume that the utter incongruity of this example generally amuses the stranger much more than anything else in Plymouth. A more than life-size equestrian effigy of the Prince, in bronze, exists in India. A cast of this was a familiar object at the Indian and Colonial and Inventions Exhibitions at South Kensington some years ago.

THE necessity for extensive restoration at Chichester Cathedral has become urgent, and

an appeal is being made by the Duke of Richmond and Gordon, the Bishop of Chichester, and the Dean. The Executive Committee proposes in the first place to set on foot the rebuilding of the north-west tower, which has been pronounced to be necessary. Mr. J. L. Pearson, R.A., who has been appointed architect to execute this part of the work, has already prepared plans, and a builder is ready to carry out the work for £6250. It is proposed to build so much of the tower as can be completed with the funds already subscribed, and to carry on the work of completion as subscriptions come in. The Committee hopes to be able to undertake, as funds are supplied, the repair of the south transept, the renewing and repairing the dilapidated pavement of the nave and aisles, the re-erection of the nine pinnacles on the buttresses, and the restoration of the ancient library for the Chapel of St. John.

MR. BOLTON KING, writing in the Land Magazine on the cost of cottage building, says: "There is no question that concerns the agricultural labourer more than the provision of good cottages. There has probably been a levelling-up of their standard almost everywhere of late years; sanitary authorities have been more active, and the depopulation of the village has allowed the worse cottages to tumble down. But now that the depopulation is checked—at least, in some districts—the supply is often unequal to the demand, and there is a large number of indifferent cottages past repair, which sanitary authorities are slow to condemn, because their destruction would drive their inmates away, or cause overcrowding in the remaining houses. Thus, there is a serious need of more cottages in many villages, not only to replace cottages that ought to be pulled down, but to supply a present scarcity. But it is well at the outset to face the difficulties, and social enthusiasts are too often ready to assume that local authorities only want permissory powers to rush into cottage building. It is disagreeable, no doubt, to be told that it is impossible to build well-constructed five-roomed cottages to pay 3 per cent, but such is unfortunately the case. I have had myself considerable experience in building labourers' cottages, and I believe the figures I give are below rather than in excess of the average cost. Every cottage should, in the interest of health and decency, have two rooms downstairs, and three bedrooms, however small, upstairs. The outer walls should be 13 $\frac{1}{2}$ in. thick, and, unless the bedrooms are to be intolerably hot in summer, the roof should be tiled and not slated. There must be a small pantry indoors, and closet, pigstye, and hovel out of doors. There should be a quarter acre of garden ground, in the interest of the landlord no less than the tenant, for the cottagers will pay additional rent for it much in excess of the agricultural value of the land. For this reason it is undesirable to build cottages in rows. Now the plainest pair of cottages on these lines cost £300. (I have myself never built for less than £305.) Their out-buildings, constructed of rough plank and corrugated iron roofs, cost about £50. The value of half-acre of land, which must necessarily be frontage land, cannot be put at less than £15, and would often be more. Then there is the cost of paths, sometimes of roads, of water supply, and of drainage. The expenses of these will vary very considerably. In my own case roads and paths cost in rough figures £13, water £10, drainage £11, per pair of cottages.

THE total cost of a pair of cottages will, therefore, be:—Cottages £300, outbuildings £50, land £15, roads, water, drainage (say) £35; total £400. Now for the return. I charge £6 per cottage. In most agricultural districts this is the maximum cottage rent. My rates average 2s. 8d. in the pound, insurance 4s. 2d. per pair of cottages, and repairs average one guinea per cottage. The income, therefore, from a pair of cottages is:—Rent, £12; less rates £1 12s., insurance 4s. 2d., repairs £2 2s.; total, £8 18s. 2d., having a net rental of £8 1s. 10d. This makes the net return for outlay 2.02 per cent. I do not

believe that it will be found possible to reduce the cost much below the figures given above, and I believe it is the universal experience of persons building healthy well-constructed cottages that they will not pay 3 per cent. If therefore such cottages are to be built in villages, one of two things must happen. Either the cost of building must be materially reduced, and this can be done only by finding a cheaper building material. I am no expert to pronounce on the possibility of this; but some public-spirited individual or body might do worse than offer a substantial prize to any person who could discover the desiderated material. Or we must face the fact that cottages have to be built at a loss, and recognise that it is to the public interest to provide decent homes for the people, even if it means an additional burden to the rates.

It is being suggested in art circles that the forthcoming exhibition of Holbein's works at Basle, held to celebrate the fourth centenary of the birth of the artist, might be appropriately supplemented by a similar exhibition in this country. In this connection, it is interesting to recall the fact that Holbein, though a Teuton by birth, lived for the greater part of his artistic life in England. It was here, indeed, that he painted some of the most famous of his pictures. A good many of these have either disappeared or left the country; but there still remains a larger proportion of his best works than any other country can boast of. To mention only a few, there is the fine drawing of "The Queen of Sheba before Solomon," at Windsor; the important picture known as "The Ambassadors" in the National Gallery; the exquisitely finished full-length portrait of Christina of Denmark, on loan from Arundel House, at the National Gallery; quite a small gallery of portraits of his Royal patron, Henry VIII., and of celebrities of the Tudor period; and, most important of all, the priceless painting of Henry VIII. giving the charter to the newly incorporated Barber Surgeons' Company, which is the treasured possession of that Company.

THE largest block of model lodgings as yet set up in London is now approaching completion, and will probably be opened towards the end of the year. This is the third of the very successful series erected by Lord Rowton, or the company which has now taken over the business he originated and still mainly controls. The first one, it may be remembered, was at Vauxhall; the second, opened the year before last, is in King's Cross Road; and this third and largest is in Newington Butts, very near to Mr. Spurgeon's Tabernacle. The two previous ones were so exceedingly well planned, and have been so thoroughly successful, that no very material change has been made in the main features of this new building, which will accommodate about 800 inmates.

IN making some alterations to an ancient house in the town of Newbury, part of which has survived the many changes which have been made in the quaint and picturesque buildings which once adorned the streets of this historic borough, some curious and interesting internal decorations in colour have been disclosed in one of the upper rooms, which had been hidden under many coats of whitewash and layers of modern wall paper. The front of the house, which is opposite the old parish church, has been re-built at some time or other, but the main constructive parts of the premises in which this decorative work remains appear to be of fifteenth century date, the oak timber framing being very massive and roughly hewn. Colour, apparently, had been originally carried over the whole of the walls of the room, but all the traces now existing consist of a bold foliage pattern, in which a spiral ornamentation is introduced in red, black, white, and blue, on the north wall, painted on a fine coat of plaster, about a quarter of an inch thick; and above is a couplet of black-letter, too much damaged to be decipherable. On the opposite side of the room, upon an oak fascia board, seven inches deep, roughly nailed to the plate, within four red and black borders, with

floreated divisions, these are inscribed, in black-letter, what appear to be verses, enforcing some moral instruction, but one of these was entirely destroyed before the attention of Mr. Money, F.S.A., was directed to the discovery.

MURTHLY CASTLE, in Perthshire, has been the property and seat of several historic families. The castle, said to have been a Royal hunting seat for centuries, is a venerable structure, which it was designed to supersede by a new mansion. The erection of this new mansion was proceeded with until it was roofed about sixty years ago. Now it stands, like the unfinished National Monument on the Carlton Hill of Edinburgh, as an evidence of vaulting ambition. The present proprietor of Murthly is Walter Thomas James Scrymgeour-Steuart Fotheringham, and since he acquired the property large sums have been spent in improvements on farm buildings, drainage, fencing, &c. Old Murthly Castle includes a keep of unknown antiquity and a beautiful modern addition. Its interior is richly adorned with paintings and other works of art. Between the old and the new castles is a fine garden, laid out in 1669, and retaining much of its old Dutch character, with terraces, pools, and clipped hedges. The small pre-Reformation Chapel of St. Anthony the Eremita, to the north of the old castle, was gorgeously restored for a Roman Catholic place of worship in 1846, but is now dismantled. The grounds of Murthly are of singular beauty, both natural and artificial, with the "Dead Walk," or ancient yew-tree avenue, the Douglas Avenue, the Lime Avenue, the Deodora or Sunk Terrace, and every variety of hill and dell, wood and stream, carriage drive and sequestered walk. For many years the late Sir John Everett Millais made Birnam Hall, which is within Murthly grounds, his autumn retreat.

A CURIOUS illustration of misdirected scientific investigation is furnished by the unpleasant adventure of two agents of the Field Columbian Museum of Chicago, Messrs. Darcey and Allan, who have been engaged for some time collecting Indian relics for the museum. A few weeks ago they were landed, by a passing steamer, on Memalouse Island, a well known Indian burial-ground. When, on its return trip, the same steamer called at the island, the visiting scientists had secured a fine collection which filled eight sacks, and included eighty-two skulls of "braves," whose bodies had been placed generations back in the numerous dead-houses for which this island is famous. The collectors had no trouble in leaving the island with their booty, but when they reached the Dalles, Oregon, both were at once arrested on the charge of "grave robbery." They have now been sentenced to a heavy fine, and, further, to carry the skulls and skeletons back to Memalouse Island, and "replace each skull and skeleton in the same dead-house from which they had taken it." As the eighty-two skulls and thirty skeletons had become considerably mixed, this part of their task may be not a little difficult.

THE close of the present hopping season will be the signal for the destruction of the old Bull at Farleigh, in Kent, one of the oldest and most picturesque inns yet remaining in the south of England. The house, which has been licensed for about three centuries, has long been a favourite with Artists, but it is in consideration to the many hop-pickers who yearly frequent the house that its quaint old gables, latticed windows, and tall chimneys are to be sacrificed. The Bull stands upon high ground above the Medway, opposite the lych-gate of East Farleigh Church, and is surrounded by ancient elm and chestnut trees, which, it is to be hoped, the hand of the "improver" will spare. All lovers of the picturesque will regret the disappearance of the ancient hostel.

A CHURCH altogether without exterior beauty, but rich in historic association, and lately brought into prominence by frequent

reference in Mr. Hall Caine's new novel, is in danger of being closed under an order of the County Council. It is generally known as the Old Greek Church, is dedicated to St. Mary the Virgin, and is situated in St. Martin's Lane. An old inscription over the west entrance is still just readable, and it tells how the church was erected in 1677 by the help of Charles II., the Duke of York, and Bishop Compton, as a place of worship for the Greeks in London. In 1682 the church passed into the hands of the Huguenots, who had possession until 1832, when a Protestant Nonconformist body began to worship there. It afterwards ceased to be used for public worship, until Canon Wade, the rector of St. Anne's, Soho, raised a sum of £1500, purchased it, and arranged that services in accordance with the ritual of the Church of England should be carried on. It is now found that a part of the building is unsafe, and the County Council has served notices on the incumbent, the Rev. R. Gwynne, requiring him to do repairs. Mr. Gwynne, however, maintains that he has not the money, and is not liable under the decision in the Metropolitan Board of Works v. Lee, in which it was held that "the incumbent of a district church in the Metropolis, although the freehold of such church is vested in him under the Church Building Acts, is not the owner of the church within the meaning of the Metropolitan Building Act, 1855, so as to be personally liable for the expenses incurred by the Metropolitan Board of Works in respect of such church as a dangerous structure." Unless the funds can be raised there is every fear that the church will be closed.

AT last Plymouth Station is to be demolished, and a building put up large enough to accommodate the greatly developed traffic at this point. The contracts for the reconstruction and the widening of the lines into Millbay have been signed, and the plans divulged. These include provision for four platforms, instead of two as at present, with another for the Tavistock and Launceston branch. A spacious iron and glass roofed lobby will be constructed, together with booking-offices, while a roofed-in space is planned for vehicles in the station yard. In order to obtain room for these improvements, the Great Western Company has taken over the whole of one street and portions of others.

THE prospectus and time table of the Central School of Arts and Crafts, which is situated at 316, Regent Street, has just been issued by the Technical Education Board of the London County Council. The school was founded to provide instruction in those branches of design and manipulation which directly bear on the more artistic trades; admission is, within certain limits, only extended to those actually in those trades; and the school makes no provision for the amateur student of drawing and painting. The instruction is adapted to the needs of those who are engaged in the different departments of building work (architects, builders, modellers and carvers, decorators, metal workers, &c.), designers in wall papers, textiles, furniture, workers in stained glass, bronze, lead, &c., enamellers, jewellers and gold and silver workers, bookbinders, and embroiderers.

IT is not often that we are free from appeals from one or other of our Cathedrals for subscriptions to carry out necessary repairs. For a few months, perhaps, we are given a respite; but it is always a brief one, and is invariably followed by an outbreak of pathetic requests for the wherewithal to save from ruin some of the most important of our historical buildings. There has been lately one of these intervals, during which the spire of Salisbury has been strengthened, the roof of Winchester reconstructed, and the north gable of the west front of Peterborough rebuilt; and now the time has come for fresh appeals. More money is wanted at Peterborough to repair the remainder of the west front; and a sum of £12,000 or more is urgently asked for to put Chichester Cathedral into a reasonable condition.

Surveying and Sanitary SUPPLEMENT.

SEPTEMBER 15TH, 1897.

THE NEW DOCK AT GLASGOW.

THE Duke and Duchess of York, on the completion of their tour through Ireland, crossed from Belfast to Glasgow. It was arranged that their first important function should be the formal opening and naming of the new Prince's Dock by her Royal Highness. The new dock, hitherto known as the Cessnock, is in the heart of the city's activity on the south side of the river, close by the shipbuilding district of Govan. This central position was only possible as a result of the forethought and public-spirited action of three citizens interested in the harbour, who a quarter of a century ago realised the suitability of the site for a dock and purchased the ground when it was purely agricultural land. It had immense possibilities, however, but they got it for 7s. 7d. per square yard. Had the Clyde Trust, a public body, sought to acquire the land the price would certainly have been much higher. In the fulness of time these purchasers freely gave up the land for the same price. The increment in value is indicated by the fact that part of the site not required for the docks was sold by the trust for 40s. per square yard, and the difference in price on the area occupied by the dock works out to over £600,000. In determining the dimensions of the dock the trustees and their engineer, Mr. James Deas, were largely guided by the ambition of the shipbuilder in respect of the future Atlantic liner. The conditions necessary for speed are a long ship and great draught, and thus provision was made in the dock for canting steamships at low water up to 700ft. length on the water-line and drawing 23ft. of water. Indeed, it has ever been the aim to make the river navigable for such craft, and thus the trustees have continuously been engaged in operations for straightening the channel, and for deepening it, involving

HEAVY EXPENDITURE YEAR BY YEAR.

The dredgings each year, for instance, are now seldom less than $2\frac{1}{2}$ million cubic yards, and the cost for this alone exceeds £50,000 per year. The new Prince's Dock has been arranged, writes a correspondent of the Times, to give the maximum of quay space. The area enclosed in the dock works is oblong on plan, the greater dimension being parallel with the river Clyde, while the entrance is at such an angle that vessels steaming up need only alter their course a few points to enter the dock. This entrance is at the west end, where the dock is of maximum width, so that vessels of any size may cant before passing into and along one or other of three basins into which the eastern part is divided. These three basins are parallel with the river, and are separated by quays extending from the eastern end into the middle of the dock. The object, of course, was to secure the additional quay space. The basin nearest the river for Atlantic liners is of an average width of 222ft. ;

the other two are 200ft. wide. The quays dividing the basins are 250ft. wide, their lengths varying from 1188ft. to 1524ft. In this way the length of quays has been increased to 3764 lineal yards, or nearly $2\frac{1}{4}$ miles, while their area is $38\frac{1}{2}$ acres, the water space within the dock being $34\frac{1}{2}$ acres. The depth of water at high water ordinary spring tides varies from 31ft. to 39ft., according to position in the dock, and at low water from 20ft. to 28ft. This is

THE THIRD TIDAL DOCK

constructed at Glasgow Harbour by the trustees. Up to 1865 the sides of the harbour provided sufficient quay accommodation; the revenue then was only a-fourth of what it is now. In 1867 the Kingston Dock, with $5\frac{1}{2}$ acres of water space, was opened, the depth of water being 10ft. at low tide. In 1870 the trustees commenced the Queen's Dock, which is on the north side of the river opposite to the Prince's Dock, and is nearly as large. The total length of quay in the harbour is now $8\frac{1}{2}$ miles, the area of water space being 204.8 acres, and of quays 113.10 acres. The trustees have now the whole of the river frontage within the harbour except the site of the old shipbuilding yard of Messrs. A. and J. Inglis. An interesting point about the construction of the new dock is that the work has been done entirely by the Clyde Trust workmen under Mr. Deas, the engineer. This has been the practice for about ten years, and, managed with discriminate care, the system has been of great advantage economically and otherwise. Progress was more easily regulated. An instance of this may be given. The Parliamentary power to proceed with the construction of the new dock was obtained in 1883, but there was no immediate need for quay space, so that the work was prosecuted slowly; by 1892 the first of the three basins was partially occupied, and from this period the dock has yielded revenue—£2733 in the first year with yearly increases, until now nearly the whole of the quay space is required and

A SITE FOR ANOTHER DOCK

is beginning to interest the trustees. The system of constructing the walls differs from that elsewhere; it is long since it was first adopted, and has proved thoroughly sound, for although many of the walls in the harbour are on sand no difficulties have been experienced. Moreover, it has the merit of economy, for to give 20ft. depth of water at low tide alongside the complete quay wall costs £80 per lineal yard; to give 25ft. depth, £90; and to give 28ft., as in the later docks, £120 per lineal yard. It is known as the triple-cylinder system, and its author is Mr. Deas, who, by the way, became engineer for the Clyde twenty-nine years ago, and has all the credit of the great improvements made in the river during that period. The three cylinders are arranged in a triangle; they are formed in concrete in courses about 2ft. thick. The internal diameter of each core is 5ft. 9in., and the thickness of

concrete around them—i.e., forming the cylinders—is 1ft. 11in. The triple cylinders are made to break bond—i.e., while the two-cylinder end is to the front of the quay wall in one group, in the next the one-cylinder end is at the front. For the wall carried to a sufficient depth to give 28ft. of water at low tide there is an additional row of double cylinders behind the triple cylinders. The procedure in constructing the wall is to excavate to a considerable depth and then to place in position the first triple cylinder, to the bottom of which there has previously been bolted a cutting edge all round. This enables it to sink into the ground, when other triple cylinders are placed on top, while at the same time a grab dredger raises the material from inside the cylinders. Iron rings are subsequently used to weight it down to the desired depth. This part of the operation is similar to that for sinking ordinary iron caissons. The concrete cylinders are sunk 10ft. to 15ft. below the finished bed of the dock, and extend up to low water level. The cores are finally filled in with concrete.

THE SERIES OF CYLINDERS

are wedged with files packed around with concrete, so that a solid mass is formed of 16ft. 3in. width in ordinary cases, and 25ft. 11in. where there is the extra row of double cylinders behind. From low water level to coping the formation is of concrete ashlar, most of the blocks being two tons in weight, with granolithic face. To add further security the walls are tied at frequent intervals by wrought-iron rods extending from the face to heavy masses of concrete rubble embedded behind. A point which involved much discussion was as to whether the sheds on the quays should be single or double story. Although there are short lengths of the former, the latter has been most extensively adopted. They confer great advantages where vessels are in port for short periods, as the lower floor is used for export and the upper for import goods. Most ingenious shoots have been provided for loading wagons from the upper story, the time taken to load forty bags of grain each of 140lb. weight being only ten minutes. The test load was 10cwt. The sheds are 75ft. wide, the height of the lower story being 20ft. and of the upper story 12ft. (excluding roof principals). The cost for these sheds was 3s. 8d. per square foot of floor area, while for a single story shed of only 60ft. width the cost was 3s. 4d. Along the front of the sheds 35cwt. hydraulic cranes run on rails, and a gangway has been built at the level of the upper floor. The cranes cost £380 each. There is a water power station for the docks equipped with two sets of engines and two sets of pumps capable of delivering 200 gallons per minute at a pressure of 750lb. This, with boilers, engines, accumulators, and accessories, cost £7531. At the western end of the dock there is a 130-ton jib crane, which will be of great service to shipbuilders in the work of fitting machinery on board the steamers they build.

It was erected at a cost of £7550, and some idea of

ITS MASSIVE CHARACTER

may be formed from the fact that in working order it weighs 270 tons, excluding counter-balance weights or bed plates. The jib alone weighs 45 tons, and the radius for the heaviest lift is 65ft., or 45ft. beyond the edge of the quay, which is adequate for the broadest of ships, as it is only necessary for the crane to reach a little beyond the centre-line of the ship. There is separate tackle for lighter loads. The crane makes a complete circle in five minutes with the 130 ton load; with a lighter load it can turn in 2½ minutes. The load of 150 tons is lifted at a speed of 4ft. per minute. A graving dock is being completed, having its entrance within the new Prince's Dock. This is convenient, for vessels steaming up the river can glide into the tidal dock and then go astern easily into the graving dock. This latter is parallel to two other dry docks. The increasing exactments of the shipbuilder are here again indicated. The first dock was made twenty-one years ago, the second in 1886, and the third now, and the dimensions of all three are worth giving as showing the demands now of the builders:—

	No. 1.	No. 2.	No. 3.
Length of floor...	555ft.	575ft.	880ft.
Width of entrance (top)	72ft.	67ft.	83ft.
(bottom)	65ft.	57ft.	83ft.
Depth of water at high water ...	22ft. 10in.	22ft. 10in.	26ft. 6in.

The rise of tide is 11ft. at Glasgow, and it will also be noticed that the entrance of the new dock is the same width at top and bottom, for ships have now, as a rule, flat floors and square bilges. The body of the new dock is 115ft. wide at the top and 31ft. 8in. at the bottom of the altar courses. The floor is built specially strong, as the stratum is sand, and ample drainage is provided for. The dock is being built partly of brickwork and partly of concrete. As very few of the ships trading with Glasgow exceed 450ft. in length it has been decided to divide the dock into two lengths by gates hinged to the side walls and turning into the recesses in the walls, which are made vertical at this point. Thus, while the dock can be used by any ship likely to be built within the next ten years at least, it will be possible to put two ships in together, or even one short vessel, without the expenses of filling and pumping out the full water capacity of the dock. The gates, which will be of greenheart timber, operated by hydraulic power, will lock a ship 420ft. long into the inner compartment, leaving the outer compartment free for the use of a 460ft. ship, which, of course, could be locked in or out by the ordinary caisson gates across the entrance, independently of the inner compartment or without disturbing the ship there.

At a meeting of the Highland District Committee of Perth County Council at Logierait, Mr. Atholl Macgregor of Eastwood reported that the Committee recommended the scheme of obtaining water from Loch Ordie should not be entered upon until the inhabitants had had more experience of the existing water supply. A public meeting is to be held in Dunkeld some time in the autumn about the matter. A letter was read from Mr. George Mackay, chief sanitary inspector of the county, stating that he had had a few samples of Dunkeld water chemically analysed, with the result that organic matter was found present in distinctly excessive proportion, derived, in the analyst's opinion, from vegetable matter. The water was free otherwise from evidence of sewage or other pollution. Filtration was suggested. In view of the facts it was thought that it became the duty of the Committee to have gravitation water to Dunkeld filtered by the construction of a properly designed sand filter, which would not cost very much money, but would improve the water supply in such a manner as to make it a first-class drinking water. The Committee's recommendation was agreed to.

INSANITARY BIRMINGHAM.

AN outcry is at present being raised against "the hopelessly inadequate measures of the Birmingham authorities to deal with the noxious and highly-injurious emanations from the street sewers." Several interesting phases of the question have been presented for consideration. One writer recalls the very exhaustive inquiry into the whole question of sewerage and sewage which was instituted so long ago as 1871. In glancing through the comprehensive report which a specially-appointed committee presented at that time, it is surprising to find Birmingham to-day in a worse sanitary position than it was twenty-five years ago. The Special Sewage Committee was appointed to inquire (1) into the "best mode of disposing of, or dealing with, the sewage of the borough," and (2) the possibility of "excluding from the sewers all excreta and other animal and injurious matters that tend to cause the sewage, as now discharged, to become a common nuisance." And at the end of the twenty-six years we find an aggravation of many troubles then existing. The evils of sewer emanations are, at any rate, more pronounced, and the effects to health alarmingly serious. In passing, it is well to bear in mind—a fact emphasised some years ago—that the low death rate of Birmingham, so often quoted as a proof of its general satisfactory sanitary arrangements, is in reality no argument. "The town," as was stated in 1870, "may have the worst possible arrangements for dealing with its excrement, and yet have a credit for healthiness; and, indeed, not have the highest of all possible death rates." It appeared to the Inspector of the Privy Council, who reported on conditions in the year mentioned, that the probable reason why more mischief did not accrue from the immense store of decomposing filth within the town, was that, as a rule, the streets and houses had much open space about them. The one point upon which the Committee in 1871 laid stress, however—and this is the matter of supreme importance just now—was the high expediency of introducing a system of interception from the sewers of excrementitious and other polluting matters. Improvements in the system of ventilation and flushing of sewers might, it was felt, be introduced with advantage; but as the main object was to prevent the accumulation of gases in the sewers, and emanations in the interior or vicinity of dwelling-houses, and as these gases, to a great extent, resulted from the decomposition of faecal matter, the consideration of these improvements was deferred until

THE EFFECT OF INTERCEPTION

of such matters had been carefully observed. The matter of interception, too, was one repeatedly emphasised in the evidence taken before the committee. The Corporation was in sore trouble at that time, with two injunctions facing it, the one restricting it from accumulating the slush or sewage at Gravelly Hill, or depositing it in such a manner as to be a nuisance; and the other, which referred to the great bulk of sewage, restraining the Corporation from dealing with it so as to create or continue the nuisance complained of, or to pollute the River Tame so as to render it injurious to the health of the persons adjoining its course. After a careful comparison and consideration of the methods employed in other towns, and with the light thrown upon the question by the evidence clearly indicated, and the testimony of the principal Birmingham practitioners, the committee was "convinced of the necessity of the introduction of improvements in Birmingham, and have come to the conclusion that it is not only possible, but, considering the difficulty of dealing with the sewage at the outfall, highly expedient, to introduce

A SYSTEM OF INTERCEPTION

from the sewers of excrementitious and other polluting matters." A great part of the solid faecal matter then discharged into the sewers through water-closets might be, the committee held, intercepted by some such plan as that recommended by Mr. Edwin Chesshire. This

was at a time when water-closets were in comparatively small use, and the midden system was largely in vogue. In its wisdom the committee condemned the middens to gradual abolition, and suggested the substitution of a new privy system, based upon the principle of exclusion from the sewers, and weekly collection of all excrementitious matters, solid and liquid. The outcome was the introduction of the pan system, which, to the minds of most discriminating people, represented a greater abomination than the evil it was designed to remedy. However, all that followed in that particular direction is history of which we need say nothing. What is most remarkable to contemplate is the admitted incapacity hitherto of a great governing authority to strike an effective blow at an evil, the full significance of which in connection with public ill-health was as thoroughly recognised twenty-six years ago as at the present time. Now that one department, at least, has been aroused from a state of long-enjoyed lethargy, it is to be hoped that the investigation of the whole subject will be proceeded with in the fullest and most complete spirit, and that the combined Committees of Health and Public Works, at the proper time, may be prepared to give the city the fullest satisfaction, and redeem in some measure the good opinions of Birmingham people.

Surveying and Sanitary Notes.

THE Paddington Vestry has applied to the County Council for a loan of over £12,000, to admit of extended road paving with hard Australian wood, instead of the Swedish deal blocks hitherto used, the former, though the initial cost is greater, being found more economical in the long run, on account of greater durability. It is besides, according to a report of the Vestry's Investigating Committee, more cleanly and sanitary. The absorbing defects of soft wood, from which the hard is free, have led to complaints of bad smells, and in Marylebone, where deal has been extensively used, Dr. A. Wynterblyth, the medical officer of health, has sought to counteract the disagreeable effluvia noticeable at times by pouring an acidified solution of sodic manganate on the road. St. Pancras, as well as Paddington, has discontinued the use of soft deal altogether in favour of the West Australian hard wood. The Special Committee of Paddington Vestry, which has thoroughly investigated the relative merits of hard and soft woods as road-making material, states that if the life of hard wood as against that of soft wood be estimated by its wear, they consider that at least fifteen years may be taken for hard wood, against a life of six years for soft wood, on roads subject to heavy traffic. Assuming the average life of the present soft wood now laid down in Paddington to be seven years, its renewal necessitates an estimated yearly expenditure of £8750. Allowing the hard wood a life of twelve years only, the yearly renewals would cost £8070, showing a saving of £680 per annum. A longer life would show a larger saving. The Committee add that there is no doubt that on roads with heavy traffic the saving would be very great. The London County Council, which fully recognises the economy of hard wood roads, will, for renewals of such material, grant a loan for seven years.

MR. H. H. WAKE, engineer to the River Wear Commissioners, and his assistants have finished the survey of the docks, roadstead, sea bed, currents, rocks, &c., at Seaham Harbour, and will now proceed to prepare a plan of the whole, showing the projected improvements and enlargements. It is proposed to run out two piers, one on the north, and the other on the south side of the docks. The scheme is also said to embody a harbour of refuge. According to report Mr. Wake has found everything very favourable to the carrying out of work involved.

THE Manchester City Council has approved the sewage scheme of the Rivers Committee, which involves the making of a culvert sixteen miles long from the works at Davyhulme to the estuary of the Mersey. The cost of the work was estimated at £258,000, including wayleaves and easements. Mr. Alderman Southern predicted serious difficulties and much opposition to the bill in Parliament. The cost, he thought, would far exceed the estimate. Sir John Harwood was unable to support the proposal, and remained neutral, as he had no alternative scheme to propose. Sir John thought that, as the affluent was purer than the Ship Canal waters, they ought to be permitted to use the waterway. Who, he asked, will be the owners of the Ship Canal in the future, and have the control and the responsibility of it? Only one answer could be given. The vote in favour of the scheme was all but unanimous.

At least 700 delegates have been appointed to attend the sixteenth congress of the Sanitary Institute, which is being held at Leeds this week, and the congress is expected to be one of the most successful on record. The local committee appointed to deal with the question of providing accommodation for the delegates and other visitors is meeting with considerable difficulty. The inaugural address was delivered in the chemistry classroom of the Yorkshire College yesterday by Dr. Farquharson, M.P. Previous to that the members of the congress were received at the Town Hall, and were subsequently enter-

tained at a public luncheon in the large hall of the Yorkshire College. The Health Exhibition was opened in the buildings in Camp Road, and to-day (Wednesday) the Lord Mayor of Leeds will hold a conversazione and reception in the City Art Gallery. The remainder of the time will be devoted to the proper business of the congress, which includes three sections, dealing with sanitary science and preventive medicine, engineering and architecture, and chemistry, meteorology, and geology; and to the holding of conferences on river pollution and domestic hygiene, and conferences of municipal representatives, medical officers of health, municipal and county engineers, and sanitary inspectors. These will be held in the Town Hall and the board-room of the School Board Offices. Mr. H. Percy Boulnois, M.Inst.C.E., the city engineer of Liverpool, will deliver the lecture to congress on the evening of September 16th, in the Albert Hall. In the same hall on the following evening, Dr. Philip Boobyer (medical officer of health for Nottingham) will deliver a popular lecture. The hon. secretaries are Dr. J. Spottiswoode Cameron (medical officer of health for Leeds), Dr. A. E. Pearson, and Mr. W. Spinks, Assoc.M.Inst.C.E.

THE Wentwood water scheme, which is designed to supply the needs of Newport for the next fifty years in the matter of a pure and abundant water supply, is again to the front. The poor puddle trench, which will have to bear the enormous pressure of 300,000,000 gallons of water, has had a bad

time, because a safe basis did not come out at the depth assigned, by a 50ft. or 60ft. or so, and because a rift appeared in one bit of the concrete with which the trench is being filled. Mr. Baldwin Latham is still on the spot. He is understood to believe wholly in the ability of the puddle trench to be sound and water-resisting to the utmost; but he suggests, if the authorities want to make assurances doubly sure, an inner wall or curtain of concrete, say 24in. thick, to help to take off portion of the pressure on the main embankment. This, or a further strengthening of the puddle-trench itself by increasing the horizontal width of it, and making it to slope at a less angle, like the splendid dam at the Liverpool water reservoir, will probably be found to be the right course. The cost of this further work will be an additional £15,000 or £20,000. Already £100,000 have been spent on the undertaking.

MARBLE deposits are known to exist in several districts in New South Wales, but they have not received the attention their importance deserves. Fine samples of red brown to almost black can be obtained near Bathurst, and a beautiful grey tint from near Mudgee. A nicely marked brown is obtainable in the neighbourhood of Molong, and a pure white from near Newbridge, said to be equal to the second class marble from the famous Carrara quarries. A deposit near Rylstone is of a black colour with white streaks and gold markings. Immense deposits of green serpentine also exist in the vicinity of Lucknow, which are well worth attention.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Sept. 17	Elgin—Artisans' Dwellings at Maisondieu...	Elgin Building Company, Limited	G. Sutherland, A.R.I.B.A., Elgin.
" 17	Horton—Additions, &c., to Lask Edge Chapel		H. Clews, Horton.
" 17	Taunton—Alterations, Magdalene-street	Committee of Co-operative Society	F. W. Roberts, 2, Hammett-street, Taunton.
" 18	Pontlottyn, Wales—Sixty-five Dwelling-houses	Building Club	6, Heol Evan Wynne, Pontlottyn.
" 18	Portadown, Ireland—Masonic Hall, Thomas-street		J. J. Phillips and Son, 61, Royal-avenue, Belfast.
" 18	Wadsley, Yorks—Wash-house, Engine-room, &c.	Committee	—Cotterill, Wadsley Asylum, Sheffield.
" 18	Plymouth—Underground Convenience	Town Council	J. Paton, Borough Engineer.
" 18	West Hartlepool—Premises, Park-road	The Hartlepool Co-operative Society	J. Garry, 47, Church-street, West Hartlepool.
" 20	Warrington—Infirmary Buildings	Infirmary Committee and Guardians	W. Owen, Cairo-street-chambers, Warrington.
" 20	Winwick—County Asylum	Lancashire Asylums Boards	J. Beaman, Delf Farm House, Winwick, near Warrington.
" 20	Llandudno—Electric Lighting and Refuse Destructor Buildings	Urban District Council	E. P. Stephenson, Council Offices, Llandudno.
" 20	Arundel—Labourers' Cottages	Duke of Norfolk	Estate Building Office, London-road, Arundel.
" 20	Leeds—Alterations, &c., to Virginia House, Headingley-lane, and Warehouse, Atkinson-street, Hunslet	C. and E. Roberts	T. Winn, 70, Albion-street, Leeds.

Practical Carpentry and Joinery.

(Continued from page 99.)

By GEO. ELLIS.

TIMBER for building purposes is divided into hard and soft woods. The hard woods are of various species, and are usually dark or richly coloured, with acrid secretions. The soft woods are pale or light tinted, with resinous secretions; these are all cone-bearing trees, belonging either to the pine or fir species. A brief description of the chief varieties is here given:

YELLOW DEAL (*Pinus sylvestris*), also called Red deal, Baltic fir, Northern pine, and Scotch fir, is the most important and useful soft wood we have. It is tough, elastic, and durable; reddish yellow in colour, with large live knots; annual rings very distinct; sapwood blue; exported from the Baltic and White Sea ports. The best balks for carpentry come from Dantzie and Riga; a coarser quality from Memel; Best deals for joinery come from Petersburg, Archangel, and Onega, in Russia; good quality also from Gefle and Soderhamp, in Sweden. Norway timber is small and inferior.

WHITE DEAL (*Abies excelsa*) is the spruce fir. It is harder and tougher than yellow deal, but is not so durable. Very difficult to work in consequence of its hard dead knots; is yellowish white in colour; annual rings clear; pockets of semi-liquid resin frequently occur on surfaces of boards; sapwood same colour as heartwood; only suitable for rough carpentry and inferior joinery. Best deals come from Christiana, Onega, and Quebec. No balk timber cut; mostly converted into flooring and matchlining.

YELLOW PINE (*Pinus strobus*), called in America the white pine, also Weymouth pine,

OREGON PINE (*Abies Douglassie*) is somewhat similar to pitch pine, but not so heavy; reddish yellow in colour, straight, and durable; free from sap; is of large size. Shipped from Puget Sound.

CALIFORNIAN PINE, or Sequoia, also called Redwood, is light, soft, easily worked, very brittle, durable if kept dry, dark-red colour, polishes well. Ports: San Francisco.

OAK (*Quercus*). There are several kinds of this useful and valuable wood used in building, the strongest and most durable being the native grown, but this is very scarce; the next in point of quality is the Russian; but

yellow colour, straight-grained, but porous, has a pungent smell, secretes an aromatic oil that protects iron and preserves it from insect attacks. The best kinds come from Moulmein and Malabar.

WALNUT (*Juglans nigra*). The American black walnut is the kind chiefly used by builders; it is a hard, tough, but open-grained wood, of dark purple brown colour, sapwood yellow, durable if kept dry, polishes well, but is difficult to bring to a smooth surface; grows in the Southern States of America, is shipped from Florida and Carolina.

MARKS AND BRANDS.—Shippers brands,

by far the largest supply is derived from the United States. English Oak is a greenish yellow when fresh cut, turning light brown with exposure. The annual rings are fine and close, the medullary rays very distinct. When boards are cut with their surfaces parallel to these rays, they crop out on the face in beautiful white markings called the silver grain. Oak so cut is termed wainscot. Riga Oak is darker in colour than English, softer, and easily worked. Dantzie, very similar, but straighter grained and more elastic. Austrian, lighter coloured, curly grain, bright medullary rays, mostly converted to wainscot. American Oak is reddish brown in colour, straight, soft, and coarse grain; not so durable as English.

MAHOGANY (*Swietenia*) is pre-eminently a joiner's wood; its use for interior fittings, &c., probably exceeding that of all other hard woods. Apart from its expense, it is not suitable for carpentry purposes in consequence of its brittleness and weight. There are two varieties of this handsome wood, one from the West Indian Islands called the Spanish, the other from Central America called Bay wood. The former is a hard, heavy, dark red wood, its pores filled with a white flinty substance that renders it difficult to plane; the latter, a lighter, straighter grained, more porous wood of yellowish red colour, the pores being empty in some kinds, in others filled with black earthy matter. Spanish mahogany is shipped from Cuba, St. Jago, Gibaru, and St. Domingo; Bay wood from Belize, this is called Honduras

though of service to the timber merchant, are but slightly considered by the purchaser, who rather depends upon his own observation when buying. Brands are continually changed, and are also forged; much inferior timber is exported unbranded and marked according to order when received. The bracker's marks upon Russian timber, however, are executed under Government supervision, and may be

is the principal forest tree of North America, and is in universal use in the States, but in England its use is confined to joinery and pattern making. It is of pale straw colour, turns brown with age, has dark, hair-like marks in the grain, is very light, clear, and straight-grained, does not warp or shrink, not durable, subject to dry rot; it is the most expensive of the pines in the London market; its price is usually double that of best Baltic pine; shipped from New York, St. John's, and Quebec; sapwood brown.

RED PINE (*Pinus rubra*), called also Canadian pine and American red deal, is a harder, closer-grained wood than yellow pine, durable, strong, and elastic, has few large knots, not much sap (which is blue); grows on shores of Gulf of St. Lawrence; exported from Quebec and St. John's.

PITCH PINE (*Pinus Australis*), is a native of Virginia, Florida, and the Gulf States; is a heavy, dense, resinous wood, of deep yellow colour; the annual rings red, and very thick; it is strong in compression, but brittle in tension or cross-strain; subject to cup shake and dry rot if covered from air; suitable for heavy carpentry, piling, and engineering purposes; not suitable for joinery in consequence of great shrinkage. Shipped from Darien, Pensacola, and Savannah.

mahogany; Mexican, from Tonalu, Tabasco, Santa Anna; African, from Axim and Assinie. **TEAK** (*Tectona grandis*).—The Indian oak is found in India, Burmah, Siam, and the East Indies. Is a strong, durable wood of brownish-

FIG. 14 QUALITY MARKS ON BALTIC BALKS

depended upon to fairly indicate the quality they represent. A few typical deal brands and baulk quality marks are shown in Figs. 13 and 14. Russian timber is "dry marked" or hammer branded; Prussian, scribed with a gouge-shaped tool; Swedish, stencilled in black or red paint; Norwegian in blue; American, hammer branded and chalked with red marks on the flat.

CONVERSION.—When a log or balk is broken down with the saw, it is said to be converted. Fig. 8 represents four methods of converting an oak log by "quartering;" this is cutting it so as to avoid having the heart in the centre of the stuff, as that part is always shaky. It is only done this way by a few exporters, but their goods fetch the best prices. Goods from Trieste are cut as shown in Fig. 9; the two centre planks are in great demand for veneers. To obtain figured pitch pine; the boards are cut tangent to the annual rings (see Fig. 10). Figs. 11 and 12 show the effect of seasoning upon boards according to the part of the tree from which they are cut; trees shrink most in a circumferential direction; and the sapwood, more than the heartwood; boards, therefore, always cast round on the heart side. A

A COMPARATIVE TABLE OF BUILDING WOODS.

Kind.	Principal Uses.	Weight per cubic foot.	Comparison with English oak.			Crushing weight per square inch.	Breaking weight of piece 1' x 1" x 12".	Authority.
			Strength.	Stiffness.	Tough- ness.			
Oak, English	Constructive and Ornamental work	lbs. 51.72	100	100	100	lbs. 7,641	cwts. 4½	T. Laslett.
" Dantzic	Roof timber, beams, and cills	52.19	7,500	3½	"

Pitch pine	Open roofs, stairs, floors, piles	39.37	82	90	92	6,462	4¾	"
Spruce, Norway	Flooring, partitions, kitchen joinery	29.37	104	100	104	7,293	3½	"

board cut through the heart, as at A, Fig. 11, will not cast or shrink in width, but will in thickness at the sap edges. B will cast as shown in Fig. 12, and shrink in width, due to the collapse of the sap cells; these faults being more pronounced in the boards containing a greater proportion of sapwood, as shown by C, D, and E. The dotted lines indicate the size of the boards immediately after cutting.

THE DECORATION OF ST. PAUL'S.

THE mosaic decorations at St. Paul's have created quite a warm controversy following the publication of details and designs of Sir William Richmond's scheme. One writer on the subject remarks: "One quality of Wren's work has always struck the architects who have followed him, and that is the beauty of its effect. This is being sacrificed to mere prettiness. The manly distinction of the work is being travestied; and the cruellest part of the business is, that while the present operations seem to receive far too easy a sanction from the kindly Dean and complaisant Chapter, it will be nearly impossible to repair the mischief when it is at last completed."

Another correspondent, Mr. R. B. Ross, writes as follows: "I am neither an archaeologist, an architect, nor a worshipper at St. Paul's, but in the course of a short and uneventful life I have often visited Wren's gloomy masterpiece in the hopes of seeing some of those beauties which artists and architects have so frequently described; and I am told by the learned that my short-sightedness has been shared by Mr. Ruskin and the late Mr. William Morris. When I first saw the reredos I must confess that the unappropriate design, the want of harmony, the idolatrous features, shocked me not at all. I welcomed its presence, as it served to remove the old impression that I was in a secular building, suggesting a neglected railway station or the Capitol at Washington. On seeing the mosaics of Sir William Richmond, I experienced for the first time that pleasure (for I cannot plead guilty to any devotional sentiment at St. Paul's) which a vast and rich interior generally produces no less than the prospect of an open and noble landscape. I saw the church beginning to be

A BLAZE OF MOSAIC AND GILDING.

As to the general effect, most fascinating to me, as to many other members of the public, it is, of course, a matter of opinion; but I would urge that, at all events, there is now something to look at in St. Paul's. After its meagre shrines have been duly visited there is something for architects to discuss, something for archaeologists to find fault with, something for symbolists to symbolise about. Churches, however, were not built only for architects or archaeologists, or for those who, coming to

worship, as your correspondent, remain to argue with and about the decoration. There are the public and Mr. Hooley to be considered, and I would like to record on behalf of these last, though quite unauthorised to do so, our gratitude to the Dean and Chapter and to Sir William Richmond and his clever craftsmen. As a docile publican, I now ask if "subject" is really of much importance in

A LARGE DECORATIVE SCHEME

to which the medium of mosaic lends itself? How many of those who see and appreciate the mosaics at St. Marks, at Monreale, at Ravenna, are troubled by the theme? Devout Protestants may cavil at the introduction of the Blessed Virgin, a patriarch here and there, or a doubtful saint; but such are not likely to delight in mosaics at all. Provided the theme is from Holy Writ or the Legend of the Church, the subject seems to me outside technical art criticism. And, unless symbolists use opera-glasses, they will not be offended by any errors in their kabbala. I would also ask if any period in ecclesiastical Art, from the first down to the eighteenth century, was scrupulous about the mint, anise, and cummin of archaeology. Our ancestors seem to have had little respect for the Art or the Architecture of their predecessors. They rebuilt, remosaicked, and refrescoed with the same heartless disregard of these things displayed by Sir William Richmond. The perpetrators of Perpendicular had small respect for "Early English," so beloved by the moderns, and the seventeenth-century mosaics in St. Mark's seem innocent of Mr. Ruskin's favourite north porch; while the harmony of the Perpendicular roof at Norwich over the Norman nave is, I suppose, a brilliant accident. They seemed to put up what pleased themselves; else what shall we say to Oxford and Cambridge with their harlequin structures, or to Wren's towers at Westminster? They would not deceive a minor canon.

"A Worshipper of St. Paul's," replying to Mr. Ross's comments, says: "His approval of that lamentable work, which is creating consternation in art circles, shows only how amiably and easily he is satisfied on the subject. As a critic on decorative Art, he severely answers himself by hailing the achievement in question as 'a blaze of mosaic gilding,' which is precisely the effect which is not that of fine mosaic work of any style or period, but which is not unknown to French theatres and cafés. Further, he affords us the measure of his judgment in Art matters by referring to the building as 'Wren's gloomy masterpiece,' which, he says, reminds him of 'a secular building suggesting a neglected railway station.' In support of such view, he is content to quote those of Mr. Ruskin and the late Mr. William Morris, who, as sworn medievalists, are, with Mr. Ross, for such reason, necessarily out of court as regards aught concerning St. Paul's."

THE CLIFF CASTLES OF WALES.

THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

THE Pembrokeshire section of the Archaeological Survey of Wales, now being carried on under the auspices of the Cambrian Archaeological Association, has been the means of opening the eyes both of specialists and of the inhabitants of the ancient principality of Dyfed to the extraordinary richness of the county in ancient remains of every kind, a large proportion of which are not marked on the Ordnance maps. The visitor coming to this part of Wales from the well-wooded districts of England, and looking at the landscape for the first time, cannot fail to be struck, and perhaps repelled, by the almost entire absence of trees, which, except in the secluded valleys, are quite unable to survive the force of the prevailing winds. Now, it must not be forgotten that what to us who are accustomed to the high farming and sylvan beauties of England appears a more or less barren wilderness would be in the eyes of the first Neolithic settlers a land flowing with milk and honey. Here there would be no necessity to clear spaces in the primeval forest with a stone axe or by the aid of fire, so that half the battle with Nature was already over. The great extent of coast line must also have been a great attraction, as the cliff castles which are to be seen on

ALMOST EVERY SUITABLE HEADLAND

show that even in the earliest times the prehistoric population supported themselves very largely by the fishing industry. These cliff-castles were at one time attributed to the Danes, but the most reasonable view is that propounded by Mr. Edward Laws in a popular lecture on the subject delivered during the Haverfordwest meeting, namely, that they were the permanent settlements of a stone-using race who lived on the harvest of shell-fish, such as oysters, limpets, mussels, razor-fish, periwinkles, &c., to be gathered on the shore. On the landward side the cliff-castles are protected by ramparts and ditches, and the beach below was reached by a dangerous path down the face of the rock. The cliff-castles were, in fact, the fishing villages of the period, but besides these there are in Pembrokeshire a much more important class of stronghold—great stone forts, with immense ramparts of rubble, enclosing a large area occupied by numbers of hut circles, or "cyttiau Gwyddelod" (Irishmen's houses), as they are popularly called in Wales. Settlements of such magnitude and defended by such heavy military works deserve to be dignified with the title of towns rather than villages.

THE BEST EXAMPLES

in Pembrokeshire are on Moel Trigarn, Carn Vawr, near Strumble Head, and St. David's

Head. The prehistoric towns at Carn Gôch, in Carmarthenshire, Treceiri, in Carnarvonshire, and Penmaenmawr all belong to the same type. Unfortunately none of these sites have been scientifically explored, so that there is some doubt as to the nationality and stage of culture of the people by whom they were erected. Judging, however, from their close resemblance to the settlement on Carn Bre, in Cornwall, recently explored by Mr. Thurstan Peter, of Redruth, it seems probable that the stone forts of Pembrokehire belong to the end of the Neolithic period. The Archaeological Survey of Wales has also borne fruit in the discovery of three or four inscribed stones in Pembrokehire and the borders, the most important of which are the tombstone of Vortipore, Prince of Demetia, at Llanfaliteg, and the bilingual Tigernaci Dobagni Ogam-inscribed stone at Llangwarren. The great interest of these monuments is that they belong to the darkest period of our national history, between the departure of the Romans in A.D. 450 and the conversion of the Saxons, about A.D. 600. The information gleaned from the inscriptions is little beyond the names of the persons commemorated in Latin and the Celtic equivalents in Ogam. But even this is sufficient to connect particular personages with certain districts, and since the language of the inscriptions is Goidelic, it enables us to mark out the area of Wales in which the Gaelic or Irish racial element predominated over the Brythonic or Welsh in the sixth and seventh centuries. The meeting of the Cambrian Archaeological Association at Haverfordwest will not have been held in vain if the strong protest against the way in which the place-names on the Ordnance map are mis-spelt is productive of some reform in that direction. According to a statement made at the general meeting of the Association, the question of the spelling of the place-names in Wales is henceforth to be referred to the district councils, whose members are perhaps the very last persons qualified to deal with a philological investigation.

FOUNDATION stones of a new school for the Methodist New Connexion denomination were laid at the Knowle Rowley, last week. The erection of this additional school has been rendered necessary by the increase in the population of the district.

DARRARA CHURCH, which is situated about two and a half miles from Clonakilty, was dedicated last week. The new church, which has been erected at a cost of about £3000, replaces the old one, which was found inadequate for the wants of the congregation.

At Messrs. Hilton, Andersen and Co.'s cement works at Malling, near Rochester, a large kiln containing about 200 tons of boiling cement overturned, knocking down other kilns and wrecking a shed. Three men were seriously injured.

MR. JAMES M'LEHOSE, a member of the firm of M'Lehose and Sons, builders, Lanark, died on the 5th inst. from the result of an accident. He was assisting to remove a scaffold at the top of a three-story building, when a trace swung round and pushed him off the plank on which he was sitting. He fell to the ground among small stones and scaffolding.

THE extensive premises of Messrs. J. and W. Greig, wool brokers, of Jameson Place, Leith, have been totally destroyed by fire. The building contained several thousand bales of wool, and the damage is enormous, though covered by insurance. Some dwelling-houses and a workshop adjoining were in imminent danger, but the firemen were able to prevent the fire spreading to them.

It is reported at Rhyl that the London and North Western Railway Company proposes to reconstruct the station at that town in consequence of the great increase in the traffic, which during the season has been enormous. It is stated that considerable extension will be made for the accommodation of the passengers, and also for dealing with goods, an extra platform being added. A widening of the line for a considerable distance will also take place, and a new viaduct will be thrown over the river Clwyd.

CARLTON TOWERS.

VISIT OF THE YORK ARCHITECTURAL SOCIETY.

AT the third meeting of the sixteenth session of this Society, the members travelled from York to Snaith, where on arrival a short visit was paid to the church. This spacious edifice is chiefly 13th and 15th century work, consisting of tower, nave with clerestory, and north and south aisles. In the eastern bay of the latter is a niche with "Sca Sæth" (S Osyth) over it; a projecting turret adjoining contains the rood-loft stair. The chancel has side chapels—on the north the Stapleton chapel, and on the south the Dawnay chapel with two altar tombs. Above hang the surcoat, spur, and gauntlet of Sir Thomas Dawnay, who died in 1642. A life-size statue of Lord Downe, the work of Chantry, is here conspicuous. Within the chancel rails is the matrix of a magnificent brass representing a mitred abbot of Selby. The church was appropriated to that abbey, and had a cell for two monks attached to it. Leaving the church the party proceeded to Carlton Towers, permission to inspect the same having been kindly granted by Lady Beaumont. Entering the

OLDER PORTION OF THE MANSION

by the western door the hall, with its low ceiling and exquisitely-carved dark oak furniture, and private chapel on the left is first seen. Re-crossing the hall and ascending to the corridor, the richly furnished study of the late lord is passed on the way to the dining-room. This fine apartment forms the south-west wing and has an enriched plastered ceiling of floral design, and a chimney-piece beautifully carved with caryatide pilasters. The walls are adorned with paintings, amongst which may be noted an excellent portrait of Lady Beaumont by E. Hughes on the left, and a corresponding painting of the late lord as Colonel of the 20th Hussars, whilst over the chimney-piece hangs a pastle of the two children—the little Baroness Beaumont and her sister. Lady Beaumont's suite of private apartments complete the old wing, and both here and in the library above the dining-room may be seen richly ornamented plaster ceilings suggestive of the work of Robert Adam. Upon a side table in her ladyship's room stands a cast in silver of the late lord's favourite charger. This souvenir was made from the old regimental lace ornamentation. After passing through the great hall and armoury, the State apartments designed by Pugin are entered. Gothic Art was at that time revived, and these extensive additions to the old house are a noble example of that period, but it is remarkable we have seen the rise and wane of Gothic Art for domestic buildings, and that the Art of to-day is based on the simpler and more homely work as seen in the older portion of Carlton Towers and not in that of the magnificent pile

ADDED BY PUGIN.

The floor here is raised and is approached from the grounds by a staircase, curved in plan, and having a balustrade of cinque foils enclosing the *fleur de lis*. A deeply-moulded doorway, with ornaments, foliage, and letter S (signifying the family name, Stapleton), is deeply undercut. The entrance doors (sometimes termed the "Silver doorway") are very striking. An arcade leads to the great hall, from which is entered the lofty suite of State apartments extending along the south front. The Venetian drawing-room, with its dark dado, having panels filled with paintings of characters from Shakespeare, chiefly "The Merchant of Venice," form a striking contrast to the richly decorated walls and ceiling. The cove of the mantelpiece is adorned with paintings of figures representing The Four Seasons with Flora in the centre. The card-room and picture gallery are a continuation of the drawing-room, and when the folding doors are open the whole forms one long gallery. A corridor on the north running the full length divides and gives access to the State bedrooms, billiard-room, staircase, &c. The party, after ascending the tower, were most hospitably entertained by Lady Beaumont.

QUIN ABBEY.

FEW of Irish ruins have so broken and troubled a record as Quin. The abbey has been the scene of innumerable conflicts, and the tales of trial and persecution associated with it are matters of history. Time after time have its monks been driven forth, and their habitation despoiled, and each time have with unflinching courage returned to repair their ruined shrine, and restore its broken worship again. From the days of its founding, or, more probably, re-edifying, by Soida Macnamara, the Chief of Clancullen, in 1402, the Abbey grew and flourished for almost a century and a half, until 1541, when it was formally dissolved by Henry VIII. He, however, granted it two years later to Conor O'Brien, who protected the monks. In 1548 it was given to two other O'Briens, Teige McConnor and Tirlogh, whose ruined castle of Dough (or Dumhach) stands amid the sand-hills at Lahinch. In 1578 Queen Elizabeth confirmed the Earl of Thomond in the "friaries of Ince (Ennis) and Cohenny (Quin)"; "in 1584 the grant was renewed to Tirlogh O'Brien and his heirs, "provided they did not conspire with rebels." About this time the monks were expelled and an English garrison put in the Abbey, but one of the warlike O'Briens, enraged at this insult to his faith, gathered a band, and, setting fire to the Abbey, destroyed the holy house and its defenders together. In 1601 it is recorded that a battle took place at Quin between the rebels under Teige, heir to Sir Tirlogh O'Brien, and Captain Flower. In this battle Teige received a mortal wound, and Walter Bourke, son of the blind abbot, was slain. In 1604 the monks returned and re-edified the place, though they were unable to recover the rest of the property, which remained in lay hands. They were once more expelled, and again returned in 1626 under their rector, Teige McGorman. They remained till 1637, when they were again expelled. In 1691 we find a cavalry camp of the ill-starred Irish army formed under its walls while they waited for their removal to France. When the monks were finally driven forth they took refuge at Drim, not far from the Abbey, where they lived unmolested by the Government. One lonely man still stayed on at Quin, where he wrote a poem on the then Lady O'Brien of Dromoland, who had shown him kindness. Since then the

GRAND OLD RUIN HAS STOOD DUMB AND DESERTED,

the feet of passing tourist or neighbouring peasant alone waking the echoes of the silent place where once the harmonious chants of worshippers rose or the martial tread of warriors rang on the marble pavement. If those mouldering walls could but tell of the scenes they have looked down on, what thrilling tales we should learn, what wild stories of hope, despair, and desperate courage. In the great civil war of 1641, it was at Quin, at the large annual fair held close by the Abbey, that the first news of the rebellion was brought, and at Quin it was that the inhabitants took arms and rose as one man to expel the English intruders, who had become possessed of castles and lands in different parts of the county. The history of the siege of one of these castles, that of Ballylia, is minutely told by Maurice Cuffe, third son of the Provost of Ennis, who died in 1634. Of Cromwell's days many tales still linger among the country folk. In that gloomy-looking tower to the east of the Abbey, with the harsh-sounding name of Danganbrack, they show a room where his soldiers stayed to dine on their way to the sack of the Abbey. It was from Quin, too, during the siege of Limerick, that the unfortunate woman was sent by David Roche with her fatal message to Hugh O'Neill, commander-in-chief of the garrison of Limerick, telling him that troops were coming to his relief. At Thomondgate, the entrance to the town, she had the ill-luck to fall into the hands of the English, who brought her before one of their own generals, pretending he was O'Neill. When the poor woman had delivered her message she was hanged, to prevent her giving further information.

PROPOSED RESTORATION AT HEREFORD.

"IF only some wealthy and liberal churchmen would start the undertaking with a handsome donation, what a splendid memorial it would be of Her Majesty's glorious reign!" In these words, part of an introduction to an illustrated pamphlet which Dean Leigh has just published, entitled "Records of the Ancient Chapter House of Hereford Cathedral," will be perceived that zealous and loving care of the fabric which has already enabled him to succeed in rebuilding the Cathedral Library and providing a modern library for the clergy. And everyone who feels an interest in the Cathedral will sympathise with Dean Leigh in taking up the appeal. The pamphlet, which bears the imprint of H. G. Norman, Cheltenham, is a collection of descriptions of the Chapter House excerpted from ancient MSS. guide books, &c., and includes several views of the ruins, together with a proposed elevation of the restored Chapter House and the ground plan of it, by Sir A. Blomfield, A.R.A., the architect of the Cathedral Library. To quote more of his introductory remarks, the Dean says: "The ruins of this ancient structure, probably erected between the years 1315 and 1349, are to be seen on the south side of the south transept of the Cathedral. All that now remains of this once beautiful chapter room are the foundations (recently unearthed) and three niches with

CURIOSLY CARVED SPANDRELS

of one of the nine arches which, together with the entrance, formed the Decagon. A portion also of the lofty vestibule and entrance remains. This entrance is from the east side of the cloister leading from the south door of the Cathedral to the bishop's palace. It consists of a pointed arch, having clustered shafts on the sides with foliated capitals. In the centre is a slender pillar or mullion dividing the archway into two smaller openings, beautifully cusped with carvings in spandrels representing an angel with censor, a mitred bishop, a nun with cross in hand, and another figure supposed to represent 'Purity.' Above is the tympanum, richly moulded and finished, with pinnacles at the sides and crochets up the gables. The ruin of the Chapter House was in the first instance caused by the cannon of the rebellious troops, and in 1645 the lead of the roof was taken by the Royalists for their barracks at Castle Green. A good deal of the material was also carried away by one of the bishops to assist in repairing the adjoining palace. It is much to be desired that a structure so elegant, and withal so necessary an appendage to a Cathedral, may yet be restored to something of its original beauty. Though upwards of two centuries and a half have passed away since it first began to fall into decay, we do not yet despair of seeing the restoration accomplished, if only some wealthy and liberal churchmen would start the undertaking with a handsome donation. What a splendid memorial it would be of Her Majesty's glorious reign! We have been unable to discover any picture of the original erection, although some few

OLD ENGRAVINGS OF THE RUINS

exist." The Dean writes the following postscript to the pamphlet:—"Since the above records were sent to the Press an interesting contribution has appeared in the Hereford Times, containing a strong appeal to every clergyman in September, 1849, urging the necessity of rebuilding the Chapter House, and also an able article on the same subject, dated September 22nd, 1849. Unfortunately want of space prevents the insertion of these extracts. We can only quote a few words from the article published nearly fifty years ago: 'The Chapter House in 1645 was a perfect gem of architecture; witness the sculptured fragments that remain. During the gallant defence of Sir Barnabus Scudamore in that year, the lead was taken off its roof to repair the breaches of the Castle.' . . . It seems to have been entirely neglected except when building materials were wanted, and then the beautiful ruin was more and more defaced and plundered."

Professional Items.

BLACKPOOL.—The new buildings on the site of the Prince of Wales Theatre at Blackpool, which are to be erected for the Alhambra (Blackpool) Limited, from the designs of Messrs. Wylson and Long, architects, will be started immediately. The site is in the Promenade next to the Tower Buildings, and near the centre of the town. Included in the scheme are a theatre of varieties, circus, restaurant, and ball room. The tender of Messrs. Whitehead, of Blackpool, has been accepted for the erection of the general building work, furnishing, and decorations, at a cost of £76,200, and that of Mr. Samuel Butler, of Leeds, for the constructional ironwork, at a cost of £12,788. Messrs. Shoolbred's tender for the seating is £6500. The architects' estimate for the whole complete was £100,000.

BURY ST. EDMUNDS.—The fine parish church of Woolpit has just been enriched by the addition of a new organ, which has been erected on the north side of the chancel. The exterior is of American bass wood, with walnut keyboard, and the pipes have been placed so as to be overhead. The front pipes, forming three faces, are of polished zinc, and there is a large double-feeding bellows at the top of the organ, which has a concave parallel board. The cost is £275.

DUBLIN.—Probably by the end of October the reconstructed Star Theatre of Varieties will be completely finished. Considering the magnitude of the work involved in the rebuilding of what is now a great structure, the progress made in its erection during the course of a few months has been most satisfactory. The decorations at the entrance are modelled on the artistic style in vogue in the Louis XV. period. The proscenium opening is 33ft. wide by 30ft. high. In the case of an outbreak of fire on the stage the asbestos curtain would completely shut it off from the auditorium. The floors of the house are of iron and concrete, and the partitions enclosing the passages to the theatre and also to the private boxes are of fireproof block. The exits will be of the width insisted on by the Corporation bye-laws not less than 4ft. 6in.—while all the doors are being fitted with "panic" bolts, which, on the slightest pressure from the inside, will release the door and cause it to fly open. As to the accommodation of the new theatre it will consist of some 110 orchestral stalls, and 350 pit stalls on the ground floor. Above this there will be a balcony with about 400 seats, and over this there are two galleries with seating accommodation for some 700 people. The architect is Mr. R. Henry Brunton, London; and the builder, Mr. Dalton, of Ranelagh.

At a recent meeting of the Dublin Corporation, Mr. John Clancy moved a resolution asking the Corporation to grant a site in Upper Sackville Street, close to the Rotunda, for the erection of a monument to the memory of Wolfe Tone. An amendment, proposed by Mr. Alderman Pile, postponing the consideration of the matter, was adopted.

GATESHEAD.—The district church of St. George, in the parish of Christ Church, Gateshead, was consecrated a day or two ago. The building has been constructed from the designs of Mr. Stephen Piper, of Newcastle, is capable of accommodating 624 persons, and is situated at the top of Durham Road. It is a plain and substantial stone structure, admirably arranged. The building has cost, with the tower, £6400. In the tower there is a peal of eight tubular bells, costing £200, and supplied by Messrs. Walker and Coxon, of Newcastle. The reredos has been designed and executed by Mr. Ralph Hedley, of Newcastle. The contractor for the church was Mr. Alexander Pringle, Gateshead. The glazing has been done by the Gateshead Stained Glass Company, and the heating by Messrs. Dinning and Cooke, of Newcastle.

HACKNEY.—The people of Hackney are to obtain a Technical Institute. The Technical Education Board has taken a lease of Cassland House, South Hackney, and will there establish this autumn an evening technical school specially in the interest of the younger workmen in the building trade. Mr. Percy R. Kirk has been appointed head master, and workshops are being erected. The Charity Commission has still under consideration a larger scheme for providing two technical institutes in Hackney.

HUDDERSFIELD.—The Committee appointed to adjudicate upon the plans for a tower to be erected on Castle Hill, Huddersfield, as a memorial of the Queen's sixty years' reign, has considered the designs. There were thirty-two sets of plans sent in, and these were reduced to three, and placed in what the Committee considered the order of merit. On the envelopes containing the keys to the designs being opened it was found that the architects whose designs were thus selected were: Mr. Isaac Jones, Herne Hill, London; Messrs. J. and A. C. Haigh, York Place, Huddersfield; and Mr. Walter R. Watson, 689, Great Western Road, Hill Head, Glasgow. The premium of £20 the Committee awarded to Mr. Jones, who has planned a square structure of mediæval design with a basement providing accommodation for a caretaker. It is estimated to cost £1500.

LLANELLY.—The proposal to erect blast furnaces at Llanelly is now taking practical shape. A large and representative meeting was held at the Stepney Hotel on Monday week, when the report of Messrs. E. W. Hampton and E. B. Moses was read and considered. The report recommended the erection of two blast furnaces, capable of producing 800 to 1000 tons each of hematite pig iron per week, or a total output of 1600 to 2000 tons per week. The cost of manufacture, they estimated, would be low, and, with the plant recommended, a profit of £20,000 could be made. The site upon which it is proposed to erect the blast furnaces is a piece of land in close proximity to the Copper Works Dock. The cost of erection was estimated at £43,560. The proposals in the report were adopted, and a committee appointed to carry out the scheme.

MIDDLESBROUGH.—The foundation-stone of an extensive block of buildings which are being erected for the Middlesbrough Co-operative Society in Linthorpe Road, was laid a week ago. The plans of the buildings are by Mr. W. G. Roberts, of Middlesbrough, and the new premises will have a frontage to Linthorpe Road of 87½ft., to Clifton Street of 110ft., and to Pelham Street of 70ft., the whole block occupying an area of 6753 square feet. On the second floor there will be a public hall 67½ft. by 52ft., and two other large rooms 48ft. by 40ft., and 40ft. by 26ft. respectively. The elevations into Linthorpe Road, Clifton Street, and Pelham Street will be faced throughout with Accrington red-pressed bricks with stone dressings, and there will be granite pilasters between the several shops. The work is being carried out by the following contractors: Excavating, brickwork, masonry, &c., Messrs. W. and H. Pounder; plastering, &c., Mr. J. R. Smiles; carpentering and joiner work, Mr. W. Thompson; slating, Mr. J. Harrison; painting, Mr. J. H. Hill; plumbing, glazing, and gas-fitting, Messrs. Walton; and all the contractors belong to Middlesbrough. The total cost of erecting and fitting out the premises will amount to about £10,000.

NORWICH.—Two stained glass windows have just been placed in Norwich Cathedral as memorials of the late Lieut.-Col. Bignold, and of the late Mr. and Mrs. Hotblack. The one to the memory of the late Lieut.-Col. Bignold is situate in the south-east corner of the south transept, near the entrance to the vestry. The upper portion bears a representation of St. Paul, on either side of which is a smaller figure, bearing a scroll inscribed, "Sanctus Paulus." The apostle stands beneath an

elaborate canopy. St. Paul in the presence of Agrippa forms the subject of the lower portion. The other window is in the south aisle of the nave. The three lights are filled by full-length figures. The Virgin Mary, bearing a lily, is figured in the eastern light, and St. John the Evangelist, with the emblematic cup and serpent in the western light, while our Saviour is represented in the centre. The upper portions of the window are filled in with angels bearing shields emblazoned with the sacred monogram and other ecclesiastical emblems. Beneath the window-sill is a brass tablet, on which are engraved the arms of the deceased. Both windows were designed and executed by Messrs. Clayton and Bell, and were erected under the supervision of Mr. Brown, architect to the Dean and Chapter.

WALLSEND.—The largest floating graving dock ever constructed has just been launched from the yard of Messrs. C. S. Swan and Hunter, Wallsend, built for use at Havana. The length of the dock is 450ft.; the clear width between the broad altars, 82ft.; and the depth over the sill, 27ft. 6in.; the draught of water under these conditions being 42ft. 6in., and the free board 4ft. 2in. The pontoons are five in number. The extreme breadth of the dock is 109ft.

WIGAN.—Foundation stones of the new Primitive Methodist Central Hall and Sunday Schools, to be erected in Station Road, have been laid. The design of the Central Hall is, taking it as a whole, of a plain, but substantial character, the nature of the site only allowing of any work or ornament being put in the front elevation, and this has had careful study, all ornament being treated boldly. The style adapted is Classical. The structure is of brick, with Yorkshire stone dressings, the bricks for the front and side elevation coming from Accrington. On the ground floor are the hall, large lecture and infant rooms, which can be divided into class-rooms, three class-rooms, and minister's vestry. The whole of the vestries, class-rooms, and lecture-room open into the hall, and are divided by clear glazed screens, so the hall has supervision over the whole of the various rooms. Off the gallery floor are two rooms to be used as class or committee-rooms. The architect is Mr. J. B. Thornley, and the builder is Mr. J. Johnson.

WORCESTER.—A new Masonic Hall was opened at Worcester recently on a site in St. Nicholas Street. The elevation of the building, which is of red brick and terra-cotta, is of Classical design. The approach is from Trinity Street, and the hall has on the semi-basement spacious kitchen, store room, and cellars. Approached by a broad staircase the dining room is reached, and on this floor are cloak rooms, and a room set apart for the Provincial Museum. The large room is over the dining room, and on this floor are also tyler's and ante-rooms. The buildings have been erected by Messrs. J. Wood and Son from the plans of Messrs. Henry Rowe and Sons.

LAMBETH.—One of the Royal palaces of Henry VIII., structures not infrequently met with in the older parts of London, situate in Hercules Road, Lambeth, is now in course of renovation, after having been given up for many years to the possession of rats. The building is a picturesque one, and whether ever Royal residence or not of the Eighth Henry's period, has distinct architectural claims of recognition. It has but barely escaped demolition by the South-Western Railway Company, whose bridge-widening operations are being rapidly pushed in this direction.

PARIS.—In order that widespread measures may be taken to prevent the recurrence of the recent terrible disaster at the charity bazaar in Paris, it is proposed to hold an International Congress of experts in that city, together with an exhibition of fire-extinguishing apparatus, &c., the scientific discussions being accompanied by practical illustrations. Architects, engineers, and others are asked to forward plans or designs for safeguarding theatres, concert-rooms, and other buildings.

SOCIETY MEETINGS.

Dundee Institute of Architecture, Science, and Art.—The annual excursion takes place on Saturday next. Edinburgh is the rendezvous, and the programme, which includes visits to McEwan Hall, adjoining the University Medical College, to Blackford Observatory, to Craigmillar Castle, and to Holyrood, augurs a pleasant and profitable outing.

Sussex Archaeological Society.—A meeting of the Sussex Archaeological Society was held at Rotherfield recently. After giving the visitors an opportunity of examining the old church, the Rev. Canon Goodwyn delivered a most interesting lecture upon its history. He said that its history went back to about 797, when a chieftain named Bertraldus gave lands for the foundation of a church at Rotherfield to the Monks of St. Denis, in commemoration of his recovery from an illness. No trace of the church could now be found, and the existence of the monastery was open to conjecture. In the further course of his lecture the speaker drew attention to the different styles of Architecture in the church, and to other interesting features.

Cumberland and Westmorland Antiquarian and Archaeological Society.—The second meeting of the Cumberland and Westmorland Antiquarian and Archaeological Society for this year will be held on Thursday and Friday, the 23rd and 24th inst., at Penrith and district. On the first day the party will drive to Edenhall, Langwathby, the Stone Circle at Long Meg, Parks, Kirkoswald, returning by Lazonby and Great Salkeld to Penrith. On the second day the carriages will proceed by Melmerby, Gablesby, Renwick, Croglin, to Armathwaite, returning by the Roman Station (Voreda), at Plumpton, to Penrith, in time for trains north, south, and west.

Leeds Master Builders' Association.—At the annual meeting of the Leeds Master Builders' Association, last week, the following officers were appointed for the ensuing year: President, Mr. W. Nicholson; vice-president, Mr. J. Walker; and secretary, Mr. E. Schofield. It was stated that the association is in a flourishing condition, notwithstanding the recent strike of bricklayers and labourers, the membership having largely increased since last year. Amongst other important business, it was unanimously decided that the association should join the Yorkshire Federation of Builders, the next meeting of which will be held in Leeds on the 16th. The trade of the city was reviewed during the meeting, and it was stated that things were quieter than they had been for some time.

The foundation-stone of a new Roman Catholic Church at Redhill was laid last week.

It is proposed to enlarge St. Paul's Church, Newbarns, Barrow-in-Furness, at a cost of £2500.

The Salford Borough Council has resolved to ask the Local Government Board for power to borrow £10,000 for the purposes of an addition to the electric supply works of the borough.

Over £600 has already been subscribed to the fund founded to defray the cost of reconstructing the organ in St. Asaph Cathedral, which is to be carried out at a charge of nearly £1300.

A factory is about to be built at Brook Green, Hammersmith, for the Incandescent Electric Lamp Company, at a cost of about £7000. Mr. J. W. Stevens, 21, New Bridge Street, is the architect. Messrs. Gordon, Lowther, and Gunton, of Finsbury House, Blomfield Street, are the architects for a new dairy and stables to be erected at Wood Green.

The Waterworks Committee of the Halifax Town Council has for some two months past had under consideration the project of constructing a reservoir at Walshaw Dean, on the moorland edge, near Widdop, some thirteen miles from Halifax. A meeting of the Town Council in committee has been convened to take up the question. The outlay is estimated at about £200,000.

Trade and Craft.

TRAMWAY ENTERPRISE.

An illustrated description of several electric tramways in Berlin and the vicinity given in a contemporary, shows how far London and the great provincial towns have been outstripped by Continental cities in conveniences for local travel. London's mechanically-operated tramways are two in number—both of them cable tramways—and their aggregate length is only four and a half miles. Berlin has had for some time at least three distinct electric tramways system: The first in the Lichterfelde district, on the south side of the city; the second running south-eastwards to Treptow; and the third away in the north, between Berlin and Pankow.

A NEW PATENT SLATE.

The Dublin Slating Company has recently introduced an improved patent slating. The slates are cut at opposite corners in such a manner as to give the same "lap" or protection to open joints as in ordinary slating, but a lesser quantity of slates is used. The surface of the slating is weatherproof. The slates being laid diagonally, the rain runs to a point on each slate; hence it cannot be blown back to an open joint, as frequently happens in ordinary slating, especially on flat roofs and in exposed positions. The weight of the slates being considerably less, the timber work may be relatively reduced, and an additional saving thus effected. Although the system has been introduced only a few months it has made headway. Architects and builders have specified and used the system on large buildings, and it is said to be largely specified for pending work.

MESSRS. ADAMS AND CO.

For many years Messrs. Adams and Co. have been intimately associated with the progress of sanitary science, and it is to their creative enterprise that mankind in general owes a debt of gratitude for the many improvements in sanitary apparatus, which have done much to bring about the disintegration of the old insanitary order of things of but a few years ago, and aid an important science in its advancement to the happy position it occupies to-day. The very name "Adams" stands for all that is sound and up to date in modern sanitary ware. The Company's catalogues are always interesting, for each succeeding issue illustrates something new. "There is nothing new under the sun." It is Messrs. Adams and Co.'s mission in life to prove the fallacy of the old adage; and certainly every sanitarian must admit the high ingenuity combined with a wise interpretation of sanitary principles embodied in the Company's patents. Not the least important patent held by Adams and Co. is their automatic flushing syphon. This syphon has certainly won very widespread and general popularity, and in proof thereof, may be mentioned the revelation of the Douglas Commissioners, that of seventy-nine Corporations sixty-four used Adams' syphons, as against thirty-six per cent. of other makers combined. The action and construction of Adams' syphon is fully described and illustrated in the latest catalogue. Numerous diagrams show the syphon adapted to suit very varying conditions. Other diagrams also show an arrangement for effective flat sewer flushing, patent combined filter and flush tank, etc. Other novel features are, that two or more syphons can be supplied to discharge simultaneously, and others provided with rectangular outlets for distributing the liquid used over large areas, such as filter beds, etc. Illustrations of the firm's well-known valves, including the patent "Insular," combining flap-valve and penstock; the penstock valve, the valve of which has led to its superseding—and that effectively—the more costly water valves; the wedge disc valve—a very popular two-year-old—claim the next section of the catalogue. They are all shown in improved designs, and it is sufficient, we

think, to say that the quality of the work and material is "Adams and Co." In the construction of their automatic floating arm, a marked advance on the older and more complicated and expensive types has been made, and by an effective simplicity the manufacturers have moved many steps nearer the difficult goal of perfection. There is a great advantage, too, in Adams' swivel gully, which claims attention. It has a swivel outgo, thereby avoiding the necessity for bends and curves. The removal of the grate and inspection cap, which is formed in one strong piece of cast iron, gives instant access to the drain, absolute protection against sewer gas being ensured by the double trap. The general form of the gully much facilitates fixing and connecting. Of manhole, lamp-hole, electric light, and other covers there is a great variety illustrated, whilst automatic pumping plant, chain pumps, etc., are also well represented. The catalogue also contains much useful memoranda and many instructive notes.

THE SIMPLON TUNNEL.

The cost of the Simplon Tunnel has been calculated at £2,800,000, and it will be distributed as follows: The Swiss Jura-Simplon Company will bear £2,000,000, the Swiss Government £60,000, raised by contributions from the different Cantons. Italy will be responsible for £200,000, of which £40,000 will be borne by the Italian Government, £80,000 by the Province of Milan, £20,000 by the Province of Genoa, and £60,000 by the Municipality of the City of Genoa.

THE PLASTERERS' STRIKE IN LIVERPOOL.

The following communication has been addressed by Mr. J. A. S. Hassal, secretary of the National Association of Master Builders of Great Britain, to the various societies affiliated to the National Association: "The strike of plasterers in Liverpool, which commenced on May 1st last, still continues, and is being prolonged through the men on strike being employed by other contractors throughout the country, and I am instructed to write and ask if you will kindly request the members of your Association to refrain from employing these men during the dispute. The master plasterers are contending against the full strength of the National Association of Operative Plasterers, and it is an open secret that, if they are defeated, the operatives in the other branches of the building trade in Liverpool intend to make similar claims, which include: (1) Limitation in the number of apprentices. (2) The right of their delegates to visit all works to converse with the men. (3) Railway fares in and out to country jobs weekly. (4) That none other than plasterers do concrete flooring, floating for wood blocks and tiles, and lathing. (5) The privilege of working overtime, when insisted upon by the men, to be paid time and a quarter; and several other similar unreasonable demands. If the Trades Union is successful in Liverpool these claims will, no doubt, be made in other towns. The officials have declined arbitration, and intimated that the operatives will not return to work until the whole of the demands are conceded. I am also instructed to ask you to call the attention of the members of your Association to the resolution which was unanimously passed at the recent meeting of the National Master Builders' Association, at Bristol, enforcing the necessity of all employers increasing the number of their apprentices, in order to remove the present inconvenient scarcity of labour."

THE NEWQUAY HEADLAND DISPUTE.

At St. Columb Petty Sessions, on Friday, twenty-two men, all residents of Newquay, were summoned at the instance of the Newquay Headland Hotel Company for wilfully and maliciously damaging its property. The Company has acquired a site on which to erect an hotel, and had recently commenced building operations. On August 31st a large crowd assembled in the centre of the town and, headed by a band, marched to the headland, demolished a wooden shed erected by the

Company, and threw it over the cliffs into the sea. It was said by the solicitor for the prosecution that the land had been inclosed for sixty or eighty years. The solicitor for the defence tendered evidence with the object of showing that the public had been accustomed to the use of the land from time immemorial, but the magistrates declined to admit the evidence on the ground that they had no jurisdiction to try a question of title. The whole of the defendants were committed for trial.

FOREIGN TENDERS.

Her Majesty's Secretary of State for Foreign Affairs has been informed by Her Majesty's Consul-General at Christiania that the Norwegian State Railway Administration invite tenders for the supply of 340,500 railway plates ("Underlagsplader") and 823,000 "dogs." Separate tenders, marked respectively "Underlagsplader" and "Dogs," should be addressed "Styrelsens Expeditionskontor, Statsbanerne, Christiania," where further information may be obtained on application. Tenders will be received up to 7 p.m. on September 29th, 1897.

THE POSSIBILITIES OF EXCAVATION.

When the old Tombs Prison in New York City was demolished the contract for excavating the foundations was leased to a Mr. Joseph W. Cody. It had been supposed that the foundations rested on piles rotted by age, and Mr. Cody was estimating the cost of machinery for digging them up. What was his delight to find, laid horizontally along the foundations, huge hand-hewed logs of white pine, three tiers deep, measuring 30ft. in length and 11'4in. square. The big beams are in perfect condition. It is likely that Mr. Cody's profit, when the timber is sold, will be between £10,000 and £20,000.

The Art of the Jerry Builder.

THE unqualified ex-
eration which is popu-
larly accorded to the
jerry builder, is perhaps
a little wanting in reason and in fairness.
People are apt to overlook the fact that the
jerry builder is the result of a system. He is
a victim of circumstances, circumstances for
which he is only partly responsible, which
existed before he was born, and which, for
him, afforded the only road to fortune. It is
true, indeed, that he is the most enthusiastic
sort of victim history has any record of; he is,
we have observed, marvellously amenable to
being victimised, he swells in importance and
power, he batters on the process of his
beguilement, and, so far as we have been able
to learn, the only way to rescue him is to
buy him out; nevertheless, he is as truly the
result of a system as is the public executioner,
and as long as people desire shams, and wish
the semblances of luxury and wealth to clothe
their poverty, so long will the jerry builder
continue the victim of our social usages.
Another injustice done to the jerry builder is
the custom of regarding him as being a sort
of reprobate at large, without principles
and devoid of any artistic proclivities.
This is an opinion which relies for its
truth entirely on the popular conventional
interpretation of the meaning of *principles*
and *artistic perceptions*. The fact is, how-
ever, that the jerry builder besides being a
cultured artist in all the affairs connected
with his own line of business, is, beside, a
downright stickler for his principles. People
who have got between a jerry builder and his
principles usually afterwards regret that they
did so. His language alone in such case
awakens disgusts which linger in the system,
and can only be eradicated by years. With
the District and Sanitary Inspectors massed
against him, the jerry builder yet holds
tenaciously to his purpose and his principles;
and the ability, attention, and perseverance
with which he gradually enforces the canons
of his art, and unflinchingly completes the
perpetration of a building without once de-
viating from the maxims and precepts of his
craft, and without for a moment endangering
his reputation as a jerry builder, is an example
of pertinacity, and of consistency of en-
deavour, which it would be hard indeed to
parallel in any other calling. It is rare,
indeed, to find one of them betrayed to a lax
interpretation of the principles of his art,
but when overwhelming distractions and
oppositions seduce him from the ways
of professional probity and rectitude,
he deeply resents the circumstances of
his frailty, and does not readily forget
his shortcoming. We lately heard such
an one lamenting the loss of a favourite
Disconnecting Trap. The sanitary inspector,
it seemed, after testing the drain, had in-
sisted on waiting to see it covered in. "That
drain," said our friend, "were nine foot deep.
I couldn't go all that way down for a seven
shilling trap, could I? and the paving laid a
top too: so there 'tis; and I'd used that very
same trap to all the houses in the road."
Indeed, when we observe this almost fasti-
dious adherence to principle reaching down
as it does to trivial matters of a few shillings
only, we can but think that the jerry builder
has motives of a high and inspiring character
hidden away from the recognition of the un-
initiated. We feel this explanation is a

plausible one: these motives are certainly
out of sight and seem extraordinarily well
hid. The popularity and the wide acceptance
of *Ars est celare artem* as a maxim allows us
to claim for the jerry builder a high status
in the history of the Arts. Not only does he
conceal Art with a completeness, breadth,
and daring that is nowhere else equalled, but
he conceals most other things as well: he
has followed the saying to its very dregs and
made its concealment his special art. Nor
in making this innovation in the interpreta-
tion of the maxim has he taken a position
inconsistent with the general rules that
obtain in the wide field of Art. All Art,
whether letters, drama, music, painting,
sculpture, rely for effect upon stimulating and
directing the imagination in raising visions
and interpreting the facts of existence as
being more perfect than they actually are.
This grand obligation of Art the jerry builder

Door-Knockers.

To be as "smart as the knocker
of Newgate" was, some quarter
of a century since, a cant term
among the lower orders to denote that a person
was smartly dressed or well groomed. The
phrase has now somewhat passed away to the
ewigkeit of forgotten phrases, but a study of
knockers has within it much that is amusing
and instructive, as we venture to think the
following random remarks will demonstrate.
The electric bell has, to a very considerable
extent, deposed the knocker from its proud
eminence on our outer portals and our inner
oak, the pressure of a button doing all that
was formerly accomplished by the heavy iron
knocker, when some late roysterer made night
hideous and sleep impossible for a considerable
distance around by his persistent and noisy
clamourings for admittance. The knockers of
old time are fast disappearing from our midst,
but there are still some left among us, mute
reminders of former state and glory. Thus, in

LONDON DOORHEADS (FIG. 7). SKETCHED BY H. F. WARING.

never overlooks. Whether it is in the matter
of the beautiful tiled paving that, after nine
months, tilts up in lumps in the night to
maim the householder in the morning; or
the gate piers that at the early age of six
weeks lean forward as though to whisper
each other the awful secrets of their genesis,
breaking the gate and blocking the entrance,
or the railing that is thereby twisted and
constrained to lift the curb it is leaded into
off the ground. Each and all these things
were, in their days of extreme and guileless
youth, cunningly fashioned by him so as to
stimulate the imagination of the prospective
purchaser, and to raise visions in him and
interpret the facts for him as being more
perfect than they actually were. He may
not be popular, but we should not equivocate
with the fact that the jerry builder is an
artist in a thousand. At the same time, and
the above notwithstanding, we wish he were
but one in ten billion.

old well-to-do neighbourhoods, one occasionally
comes across a fair specimen of the metal-
workers' Art as applied to knockers, though it
must be admitted that the specimens are few
and far between, especially of native production
—a matter in which the Netherlands follows suit,
for in the days of the Renaissance these knockers
were far from being in common use, and when
they were, they were usually formed of two
short bars welded together, and shaped into a
hammer, diverging towards the free end, and
working in a couple of eyes. Coming to
France, however, knockers assumed a most
elaborate form, being almost excessive in their
decoration, though, owing to the fact that
knockers fell into disuse under the Valois
kings, they are exceedingly rare. Some very
fine specimens have, however, been preserved,
and nothing finer perhaps could be produced
of their kind than one having a richly traceried
canopy and niche, sheltering the hammer,
which is formed of a most spirited St. George on
horseback, slaying the dragon, or the companion

example, now at Florence, representing St. Michael. A specimen in the Museum at Troyes has a naked boy holding a chequered shield for a hammer; and another a saint, with enriched backgrounds; and another of the same type, with a dragon for the hammer, is to be found at Dijon; while another similar specimen is at Chateaudun. On the door of Jacques Cœur's house at Bourges is a very good specimen, which has a handsomely carved niche, with shell and pierced decoration, which protects a handsome pillar-knocker. All these specimens are carved, chiefly from the solid, in the grandest style of Mediæval Art, the treatment being in all French specimens, whether elaborate or simple, vertical, compact, and restrained. In the Cluny Museum there is a very elaborate door knocker with the arms of Henri II. and crescent of Diana. It was taken from the Chateau of Auet, and dates from about 1552. At the top it has a lion's mask, with two crescents, imparting much the appearance of horns, and below, a scroll ornament. On the shield below, which is decorated around with panels, tongue and dart, and other ornamental *motivi*, there is the royal crown, and beneath it a small shield bearing three fleur-de-lis. Then succeeds another scroll ornament from which the actual knocker proper depends. This is certainly one of the most elaborately worked knockers extant, and one wonders which of the smiths among Guillaume Hérard, Gilbert Drouys, Adam Bontemps, Michel Suron, Jean Duchesne, or Jacques Martin, executed this particular piece of work. In the earlier years of the seventeenth century knockers were somewhat out of fashion, but, when made, they were either stirrup-shaped, with heads and masks, or of a beautiful pearl drop-like form, with rich foliated mount, depending from a rosette or lion's head, the invention of which is generally ascribed to Cercean. Still designs for knockers were extraordinarily varied, not to say fantastic, down to the days of Louis XIII., when an embossed plate, with a heavy moulded stirrup-shaped hammer, became the regulation form. They were much the same under Louis XIV. and Louis XV., but the plates were merely pierced, and reached a large size and high degree of elaboration. It was not until near the year 1600 that door knockers became prominent in Germany, when they afforded scope for a somewhat fantastic treatment. At the South Kensington Museum there are four very fine examples, especially one, grandly chiselled, reputed to be from Nuremberg. The nails which fastened all this work in place were sometimes handsomely worked. In Italy the door knockers were usually plain and severe, the work of the smith being expended on the *fanali*, or cresset light holders, which, as a rule, were very handsome pieces of work. In Spain the knocker was very generally employed. They are varied in design, and very frequently are based on tracery and architectural forms, with the hammer, ring, or stirrup-shaped striker, lined and pounced by the tool. A particularly fine one, with serpents writhing round the ring and flamboyant plate, has been mentioned by Street as being in the north transept door of Pamplona Cathedral. Later, more fanciful designs, with Moors' heads, lizards, dolphins, or dragons, came into existence. A very fine specimen of Spanish iron knocker work is to be found in the South Kensington Museum, which is carved in the manner of screen work, the knocker being a nude figure of a boy, bearing a panel on which is inscribed "Salve." The specimen is highly ornamented, and has a niche and cupola—altogether a splendid design. Coming to our own country last, we have really very little to show in the way of knockers, which is the more surprising seeing that we have turned out some good iron work at times. Perhaps in this, as in other directions of metal working, we shall show an improvement as time goes on, though, with the advent of the electric bell, it would certainly seem as though the days of the knocker—ugly, plain, fanciful, or elaborate—had gone, never to return. To those, however, who may be interested in the knockers of old, a specimen from Stockbury, in Kent, shows us a circular serrated iron plate, fancifully pierced, from two eyeholes,

LONDON DOORHEADS (FIG. 8). SKETCHED BY H. F. WARING.

fastened to which the knocker, tapered at both ends, notched in the middle, with a half-circular swing at the top, and a heavy piece at the bottom for a hammer, depends. This is a rough specimen, and certainly strikes one as being very useful, if not particularly ornamental. Certainly, as a work of art it is far behind the French and Spanish specimens referred to, and, while the preceding lines do not at all exhaust the interesting subject, they may possibly tend to draw attention to a very interesting division of the artistic ironworking industry.

RESTORATION OF CHICHESTER CATHEDRAL.

IN reference to the appeal recently issued for funds wherewith to carry out the restoration of Chichester Cathedral, a Sussex Churchman remarks in a letter to the *Times*: "I and many others will be deeply grateful to you if you will assist us in calling the attention of the executive committee to the serious responsibility resting on them of deciding upon what should be done to preserve the fabric of our venerable cathedral church. In 1892 the building was found to be suffering so severely from want of repair that Archdeacon Mount (one of the residentiary canons) started what was named the 'Domus Fund,' the object being to collect each year, say, £500, to be spent upon purely practical repairs, not 'ordinary repairs, but only for making good serious structural

damage caused by the ravages of time and weather.' But it is now evident that one portion of the building—viz., the western part of the northern nave-arcade—is in too serious a condition for it to be wise to wait for the Domus Fund to accumulate a sufficiently large sum of money to allow an architect to cope with it. It is again proposed to appeal to the public for help, but the executive committee, instead of simply aiming at putting the building in substantial repair, are of opinion, it seems, that they should go to the public with a complete scheme of restoration—i.e., that they should not appeal for funds to 'repair' the fabric, but also ask for sufficient money to 'restore' it; or, in other words, build up anew all portions which are missing, re-making those purely ornamental features which are decayed, and, where there is no evidence of what was the original design, making new architectural designs after the manner of the old. The grand old Cathedral Church of Chichester is less 'restored' than any other in the country, and I would submit that it is consequently the more interesting and beautiful, and also more inspiring of devout thoughts by making us clearly understand the devotion of our forefathers. From the manifesto now put forth I fear that all the new work which the committee propose to add will seriously detract from the value of the ancient work which remains. All that we can do is to imitate the past; and, in my eyes, all such imitations do and must fall very far short of that genuine inspiration of the work imitated."

LONDON DOORHEADS.

(Continued from page 108.)

By H. F. CARE AND H. F. WARING.

PART II.

IN the former portion of this paper we dealt with examples of the first half of the eighteenth century, when the influence of Wren predominated in the work of the period; the present portion will deal with the latter part of the same century, when the influence at work was that of the Adam Brothers.

The characteristic note of this period is a purer and severer classicism, relieved by a very light and simple decoration in the shape of festoons of flowers and grotesque heads.

But, like all general movements, this change seems to have manifested itself not only in the work of its acknowledged masters, but also in a simpler and correcter use of their classic models by the workers imbued with the spirit of the earlier period.

Thus the general character of the door illustrated in Fig. 7 is more in accordance with the later than the earlier period; the architrave rests directly upon the capitals of the pillars without the interposition of any consols or human heads; though the acanthus leaf still remains as a decoration of the Ionic cap, pillars have replaced pilasters, and are correcter in the details of construction, whilst there is an absence of that elaborate decoration of classic forms which marked the work of the earlier period.

But the masters of this period, whose influence is to be found stamped on the best examples of the latter portion of the eighteenth century, were the Brothers Adam; their particular and especial field of work was the Adelphi, but their influence was almost universal, and may be traced in most of the exterior woodwork of this period, and also in the pattern and decorations of the works in stucco which succeeded it.

The Adelphi, lying between Buckingham Street and the Hotel Cecil, in the Strand, is made up of several streets called after these famous brothers, as the small district itself derives its name from them.

In 1768, on the site of old Durham House, they built a series of arches on which they erected Adelphi Terrace, thus forming the beginning of the embankment of the Thames. In No. 4 of this terrace David Garrick lived from 1772 until his death; and connecting this terrace with the Strand are Adam Street, with John, Robert, James, and William Streets, the names of the four brothers.

In all these streets excellent examples of their work are to be found, and notably Nos. 7, 8, and 19 Adam Street, all of which are in a good state of preservation. The building of the Society of Arts, on the north side of John Street, is also the work of the Adams, and shows the same characteristics in stone as their doorways show in wood.

The example of Adam doorhead we have selected for illustration (Fig. 9) is No. 11, Buckingham Street. It is simple almost to severity; there is a total absence of decoration save the light festoon hanging from a grotesque mask along the frieze, and the small and rather dainty triptych moulding running round the panels of the doorway.

The mask is a prominent feature of the work of this period, and is sometimes human, more often animal; and in Bartlett's Buildings, Holborn, where, with one exception, the doorheads are precisely similar in character throughout, clearly showing the Adam influence, but apparently of a later date, the masks are the only points that vary, and are different in every case, save in one or two instances of adjacent doors, when the two doors are treated as a whole, and the masks accordingly correspond.

The only exception in Bartlett's Buildings, No. 15, is obviously of earlier date, and a much purer example of Adams' influence. There is a delicate festoon of foliage along the frieze, and the pediment is straight with simple

mouldings instead of broken, but the state of preservation in this case is bad.

The remaining examples selected for illustration in this paper are from Queen Square, Great Ormond Street, and Great College Street, and are all specimens showing a mixture of the spirit of both periods, and, except in the case of Fig. 7, the doors of the Italian Hospital in Queen Square are later than the best period of Adams' work.

late, and show the influence of Sheraton and Chippendale, and it is usually in late work only that we find the pilasters within the doorway flanking the door on each side.

This example probably belongs to the end of the last or the beginning of the present century, the work of someone sympathetically imbued with the characteristics of both periods.

Fig. 10 is a doorhead from Great College Street, Westminster; the consols must cer-

Fig. 9.

From the materials afforded by the doors of the Italian Hospital themselves (Fig. 7) it is extremely difficult to fix their date. Their general appearance as a whole is distinctly early in character; the consols and mouldings, more especially the break in the centre of the moulding, belong to the earlier period of Wren's influence; but it is also noticeable that long panels are substituted for classical pilasters, and the mouldings round the door are much simpler than we should expect in an early example, whilst the masks are certainly more in keeping with the work of the later period.

The lights over the door are undoubtedly

certainly have been copied or taken bodily from some other doorway; for the top is slight, and quite out of keeping with its heavy and elaborate supports, and this door may be safely ascribed to the present century.

The last example (Fig. 11) is another doorway from Great Ormond Street, and belongs to an insurance company, and the emblem in the centre is dated 1824. It is possible that this may be a later addition; but the whole effect is so very similar to its neighbours in the same street, and the latter are in much more in accordance with the spirit which inspired the work of the seventeenth century, that one has little hesitation in assuming the

date 1824 to be correct, and pronouncing the present example a late copy of the similar doorway (Fig. 8) referred to above.

These few examples are some specimens of eighteenth century work still standing in London, and all of them are worth a visit by the student or the Architect. Another excellent example from Carey Street may be seen in the South Kensington Museum, only omitted from this paper as it is no longer an existing London doorhead.

R.A.'S AS DECORATORS AND DESIGNERS.

A CORRESPONDENT of the St. James's Gazette is rather severe on R.A.'s as decorators and designers. He says: "Your contributors have perhaps said enough of the Richmond mosaics. Taking them in connection with the sombre grandeur of their surroundings—the somewhat grim unkemptness of the vast expanse of walls and arches—I would be inclined to characterise them as being done in the 'high sweetstuff manner'; or, rather, there is a suggestion of the sticky common enamel. But there are some other R.A.'s who have been allowed to range at large in the City, not, I think, to its betterment. The unfortunate Wren, for whose monument we are invited to 'look around,' would himself, could he take a 'look around,' weep tears of mortification at the fashion in which his great work has been daubed over. The R.A.'s have been somewhat busy of late elsewhere, acting as ædiles up and down the City; but wherever we come on their handiwork we cannot find that there is anything very superior or impressive. The late Lord Leighton had a special "hobby" in the monument to the Duke of Wellington—which he induced the Dean and Chapter to

SET UP UNDER AN ARCH

in the nave, with very disappointing result. Any one can see that it is unsuited to the place, which is an arch—which is not of a covering or sheltering kind, but an opening in the wall of the nave. Here it looks bald and obstructive. The monument itself seems too big for the position. Any architect would have said beforehand that the spot was not fitted to such decoration. Nor will the effect be mended when the equestrian statue is supplied, but made rather worse. Let us next take a flight to Piccadilly Circus, where another R.A. has set up his fountain. This is a strange thing, with its six-sided 'tub,' and the little figure perched on a sort of spike. Such as it is, the fountain is quite unsuited to the place. It requires a large clear area about it. The metal details are all indistinct—perhaps 'blobby'—and the design surely uncertain in its purpose. Were a diagram made of its outlines it would be found to be ill-balanced and inartistic and the apex not proportioned. It is not clear what the function of the tub aforesaid is—is it meant to be kept full, and the water to overflow in a sheet on all the sides? Again, at Knightsbridge, close to Sloane Street, we have Mr. Onslow Ford and his Strathnairn equestrian figure. There is a hint here of the old Colleone treatment. The rider is perched upon

A SORT OF STONE WARDROBE;

but the accommodation on this pedestal is much too straitened. The horse has hardly room to stand. This is the fault in all the London statues—the pedestals are too shrunk and mean; the figures seem as if about to fall off. In none is there that commanding dignity and state which we see in foreign work. The pedestal should be treated as if it were a portion of the ground. The green and gold decoration has a tawdry air. At Hyde Park Corner we come upon the Wellington equestrian statue, by the late Boehm, R.A., and can only think that 'the Dook would have a word or two to say' on his effigy; for it is but a poorish attenuated composition. The four soldiers—a good idea—are squeezed in upon the pedestal, and seem more important than 'the Dook' himself. The horse is lanky, the rider shabby, and if it be looked at from

LONDON DOORHEADS (FIG. 10). SKETCHED BY H. F. WARING.

certain points of view it will be found that the modelling is astray. It is really no more than a sketch. A real bit of equestrian work is that of George IV., in Trafalgar Square—not of the first class, perhaps, but correct in omnibus, and plainly by a trained sculptor. And what shall be said of the

R.A.'S DOINGS AT WESTMINSTER HALL,

save what Johnson once remarked: 'The man would read his poem to me, yet I never did him an injury!' It would almost seem as though the architect had been retained specially to disfigure the place as much as he could. This must be the solution, for Mr. Pearson is a clever artist in his line. The dreadful 'outhouse' or stable, with its squat-tower, is a standing eyesore. But the whole thing speaks for itself, and is a daily horror for the æsthetic omnibus rider. The resuscitated James II. at Whitehall might well be visited by our sculptors to learn what spirit and vivacity and perfect serenity of treatment, founded on knowledge, will do. It is a fine work. Finally, some R.A.'s have been allowed to work their will, 'wicked' or other, on the classic walls of the Athenæum Club—compound yolk of egg and *café au lait* tints in the strangest fashion. All these R.A. efforts are not encouraging, and I think we would do well to fall back on the work of ordinary conventional designers."

MADDERTY Parish Church has been reopened, after having undergone extensive repairs and alterations.

It is proposed to erect a memorial to the late Mr. Tom Tagg in St. Paul's Church, East Molesey.

LADY AUGUSTA MOSTYN has announced her intention of erecting a new church at Llandudno, at an outlay of £2000, on a site given by her son, Lord Mostyn.

THE Fire Brigade Sub-Committee of the Leeds Corporation has approved of a design for a new Police-station and Free Library, to be erected at the end of Reservoir Street, Woodhouse.

THE Primitive Methodist Chapel in Nelson Street, Newcastle, has been disposed of for £7500, to a well-known tradesman. The building will in the course of time be transformed into business premises. The congregation of this place of worship has secured a site in Northumberland Road, and intends to erect thereon a building more suitable for its requirements.

ELECTRICITY AND LIQUID AIR.

DISCUSSING the properties of liquid air, a writer in the New York Tribune says it would not be surprising if before long one of these observed properties were turned to account. While Pictet, Cailletet, Dewar, and Olszewski, he continues, were conducting their fascinating experiments with the condensation of gases, practical men thought: "Very pretty, to be sure; but what does it amount to?" One highly important but now comparatively old industry in which the liberation of a compressed gas (ammonia) has been employed is refrigeration, either in cold storage establishments or ice manufacturing plants. Now another entirely new use has been suggested. The recommendation will be of interest chiefly to electricians, but also to some extent to the general public, which is being served so extensively to-day by electric light and power. Within the last few years there has been an enormous utilisation of waterfalls in America and Europe for power that shall be transmitted to a distance in the form of electricity. The most pretentious plant of this character in the United States is that at Niagara Falls; but in the number of such enterprises, and in the distance to which power is thus sent over a copper wire, the Pacific slope at present eclipses the east.

FROM NIAGARA TO NEW YORK.

As yet no attempt is made to transmit electricity for light and power to points more than thirty or thirty-five miles away from the generating station. But the possibility of reaching out very much further has been seriously considered. Only a few days ago it was announced that an electric transmission line eighty miles long had been projected in Southern California. And electrical engineers have given much attention to the question of how far away from Niagara the power of that cataract can be sent economically enough to compete with steam. Opinions differ, as might naturally be expected; but so eminent an expert as Mr. Tesla has declared emphatically that if a market could be found in the metropolis for a sufficient amount of electricity to warrant the building of a suitable line, it would be entirely feasible to transmit current from the Niagara dynamos to New York. Some suggestions recently made by Elihu Thomson, a leading American authority in electrical matters, regarding the possible use of liquid air, will be more readily understood if the reader recalls the limitations which

hamper long-distance transmission of electricity. The first of these restricting circumstances is the cost of the wire. When electricity goes by a few rods, the metal conductor which guides it on its journey would be comparatively inexpensive; but when the distance is great, and the amount of energy transmitted is considerable, the amount of copper required becomes formidable. From Niagara to Buffalo, over a line that is about twenty-five miles long, there have been strung twelve wires, each nearly an inch in diameter. Each set of three will be employed to carry 5000 horse-power, when the new dynamos are ready to supply the whole 20,000 horse-power that will eventually be required. The losses by leakage and resistance are said to be less than 20 per cent. But over a line fifteen times as long, the diminution would be much greater. Consequently, to deliver 20,000 horse-power in New York, a larger amount must be supplied at Niagara than for the Buffalo service, and conductors of greater size must be employed. It will be seen, then, that a great deal more than fifteen times as much copper would be needed in the one case than in the other, unless some new factor were introduced.

THE QUESTION OF VOLTAGE.

Another limitation which bothers the electrician is the voltage, or pressure, at which it is feasible to transmit electricity. The important discovery was made, a few years ago, that if, by a piece of apparatus called a "transformer," the voltage of a current were raised, the electricity would be sent over a smaller wire. To save copper, therefore, it is the fashion to carry the voltage up as high as possible. On an overhead trolley wire the current is sent at only 500 volts, and for incandescent lamps 110 volts was for many years the standard. But on the three-phase line from Niagara to Buffalo a voltage of 11,000 is employed. This is about the same as is used on most of the Pacific coast transmission lines. Now there is more or less talk about doubling the voltage on the Buffalo wires before long. And if the proposition is carried into effect, the result will be watched with profound interest. The fact is, the higher the voltage, or pressure, the more careful must the constructors and managers of such a line be in regard to insulation. The current shows a most amazing propensity to hunt out routes of escape which it would have ignored before. It behaves precisely as steam or water in a pipe would if the pressure were multiplied. Although the porcelain insulating supports of the Niagara-Buffalo wires have been tested for a voltage of 40,000, yet there is a liability that any one of them may give out under a much lower strain, and let the current leak down the pole. Electricians have speculated on the possibility of effectively transmitting a current whose voltage has been transformed up to 50,000; but at present 12,000 or 13,000 is regarded about the limit of safety. Mr. Thomson's first point is that the electrical conductivity of a copper wire is greatly increased by reducing its temperature. This was inferred from the impairment of conductivity that results from heating. But Dewar demonstrated the fact by making tests with wire immersed in liquid air or liquid oxygen. The conducting power of the wire being enhanced in this manner, of course a smaller wire would suffice for the same service.

THE SURPLUS POWER OF THE FALLS.

The next fact to which attention is called is that "liquid air is one of the most perfect insulators, and that most insulating materials cooled to the temperature of liquid air are greatly improved in insulating qualities." Inasmuch as this temperature is about 200 degrees below zero, Fahr., there is a strong natural tendency toward the absorption of heat from adjacent objects and the consequent evaporation of the liquid. Hence the successful use of air as an electrical insulator depends upon thorough insulation against heat of the receptacle (pipe or trough) containing it. Mr. Thomson emphasises this fact, refers to the cheap methods of Lindo and Hampson for liquefying air wholesale, and then goes on to

say: Niagara power is twenty-four-hour power, and as there are but few industries demanding power for the whole day, it must follow that surplus power is either not used or wasted, and that to keep the plant working night and day at full capacity is desirable, even if some of the power only yields a moderate return. Can it not be used in making liquid air? Cannot the excess at certain times of day be put to use in compressing air to be afterwards liquefied on the large scale? It would seem that large tanks of liquid air can be heat

lines a loss on the line of about 10 to 15 per cent. is suffered. With 18,000 horse-power this would mean from 1000 to 1500 horse-power lost in resistance of line. If the conductors were immersed in a pipe with liquid air the loss might fall to not over one or two per cent., perhaps, leaving available a large power for condensing air to supply evaporation. Just how far 1000 horse-power would go in keeping the conductors supplied with liquid air coatings is a matter requiring data to determine. But if it were not suffi-

LONDON DOORHEADS (FIG. 11). SKETCHED BY H. F. WARING.

insulated very perfectly by layers of air and fibrous material properly placed outside. The evaporated air from the tank could traverse the jacketings in successive order from within outward, so as to help keep down the temperature of the jacketings. A furnace with an internal temperature of 2000 degrees to 3000 degrees above the normal temperature of the air is easily insulated by moderate thicknesses of asbestos or other fibrous coating, so that the outside temperature is but slightly above the normal. The temperature difference between liquid air and normal air is, say, one-eighth of that between the interior of the furnace assumed and the normal, so that it ought to be possible to insulate so that but little heat would enter.

TOUCHING THE PROBLEMATICAL.

In most electric long-distance transmission

cient for the purpose, there is a surplus of power during certain hours to supplement it. But it may be possible that a much higher voltage than is now used (10,000 to 20,000 volts) may be successfully used with conductors cooled and insulated by liquid air. If the potential could be raised to 50,000 volts, either the loss on the conductors for a given power transmitted, would fall off as the inverse square of the voltage, or the conductors could be made smaller in the same proportion, or the distance of transmission increased with the same section of conductors as the square of the potential. These are matters worthy of experimental determination.

The Latin Quarter, the most historical quarter of all Paris, is soon to have a museum of its own.

CITY ARMS OF LONDON.

A KNOWLEDGE of heraldry is very useful sometimes, but most folks can worry along through life very well without it. This very ignorance of a subject, however, often tends to make one take a spurious interest in it. If you keep your eyes open, which very few people do, in your wanderings through London, you will see the arms of the City paraded in all sorts of places. Wherever the City fathers have done anything of which they are more than usually proud, there they affix the City arms as a sort of seal of greatness to the undertaking. That is quite a fit and proper thing to do; but what troubles the open-eyed peripatetic, whose knowledge of heraldry is in an inverse ratio to his curiosity about things which in no sense concern him, is the fact that to his unlearned eyes it is very seldom that the City arms in one place exactly correspond with the City arms in another place; that, in fact, he could make quite a nice little collection of variations of the City arms. For ourselves, we began with the goldsmiths. In our innocence we imagined that if any one was certain to have an

AUTHORITATIVE COPY OF THE CITY ARMS about it would be those who stamp it on gold and silver plate and other things of their own designing. But when we asked if we might be favoured with a sight of the City arms used by the goldsmiths in question when they worked in gold and silver for the City fathers, we were regarded with a most suspicious stare, and informed that the copy used by them was not by any means authoritative; that they made no pretence to be strictly accurate in such matters, and considered themselves justified in giving their imagination just so much rein as the artistic necessities of the particular instance seemed to demand. By dint of a little perseverance we discovered that this was perfectly true, and we were therefore not surprised to discover that no two goldsmiths gave the same picture of the City arms, and that even the same goldsmiths did not always use the same die. Thus foiled in our search for accurate knowledge, we repaired to the Guildhall Library, where every attention and courtesy was shown us. There, after consulting many books, we failed to find any two impressions of the City arms exactly alike. And on envelopes used by the libraries there were

TWO TOTALLY DIFFERENT SEALS.

These in their turn were both very different from a picture of the City arms given in a book called 'London's Armoury.' When we pointed out these differences to the attendants, we were recommended to visit the town clerk's offices, where we would be certain to receive all the information we desired, and where a true and correct representation of the City arms would be easily procurable. Thither accordingly we repaired. But first of all the permission of the town clerk had to be obtained before we could ask any questions. This permission duly granted, our guide and informant showed us an illuminated picture of the City arms, wherein the only difference which we could detect between it and the one in the Guildhall Library was that in one the scroll was more intricate, and in the other the lion's head was wanting. Next we descended into the foundation of the office, where our guide produced for us a book entitled 'Arms of the City of London and Twelve Principal Livery Companies. Published by Austin Oldisworth, at the Golden Ball, in Cannon Street, 1701.' Beneath the picture of the City arms was the following description:—'The arms of the ancient City of London are argent. A cross and sword erected in the first quarter gules, and for the crest on a wreath of their colours, a pair of dragon's wings endorsed silver charged with a cross, as in the armes, supported by two dragons argent, their wings elevated and charged as the crest, standing on an escrolle, with this motto: Domine Dirige Nos.' Watching for the City arms wherever we walked, we noticed them sometimes on a lamp-post with lions instead of dragons; or on a bridge, with the dragons crawling on the ground, instead of standing rampant.

NEW HOSPITAL AT EDINBURGH.

AT the west end of the Castle Rock, Edinburgh, workmen are engaged in taking down several old buildings, on the site of which, as has already been intimated, a well-equipped military hospital is to be erected. The old buildings now in process of demolition, which were used as stores, &c., were of no great antiquity. They were simple and unobtrusive in appearance, and are understood to have been built in the end of the last century, a period responsible for the high unsightly structure further west, which Edinburgh people would not be sorry to see removed also. The new Military Hospital will have architectural features of a Scottish character, which the old buildings did not possess, and as viewed from Princes Street or Castle Terrace, will have a pleasing appearance. The ground plan covers an area of 160ft. by 120ft. The block, which will face Princes Street, will be three stories in height; and towards Castle Terrace there will be an annexe of the same height,

THE WALL OF A PROMENADE,

and the gable of the south block which will only be of two stories. On the east side will be the kitchen and entrance gateway. The east and southern sides of the hospital will be very little seen from the city. To Princes Street a prominent architectural feature of the buildings is a range of dormer windows deeply set in the wall-head, and rising considerably over it. From the apex of the stone gablet to the foot of the window the measurement is 15ft. The wall-head between shows a corbelled cornice with embrasures, and round the dormers is carried an ornamental string course. The windows of the lower stories are square-headed, with jambs of dressed stones. Between the building and its annexe, which faces Castle Terrace, the façade is broken by a large recess, which will form a pleasant feature from below. The whole of the buildings will be of stone. The gable of the south block has bold crows-steps, and

THE WINDOWS SHOW VARIED FEATURES.

On the ground floor of the Princes Street block will be a ward with fourteen beds, with the most improved sanitary arrangements in the annexe. There will be a spacious lobby with entrance from a courtyard, round which the buildings will be grouped. This will lead to a waiting-room, which in turn will communicate with the surgery. The other accommodation at this level is set apart as pack and linen stores. A substantial stone staircase, which is shown in the elevation as a projection, will give access to the floors above. On the first floor there will be a sixteen-bed ward, a day room, and three small wards, with the usual rooms for orderlies. The floor above in its internal arrangements corresponds to a large extent with that just described. There will be a sixteen-bed ward, and one of three other small wards will be set apart for officers. In it there will be two beds. From this block a corridor runs southwards, at the end of which a completely new kitchen establishment for the hospital is to be constructed, with all the latest appliances for sick-room cooking. The kitchen will only be one story in height, and will be lighted from the top as well as the sides. In the south block, on the ground floor, is a ward of five beds for special infectious cases, with separate entrance and

SANITARY ARRANGEMENTS,

so as to isolate it from the rest of the building. There will be rooms for the orderlies, and stores, on the ground level, and in the floor above will be the quarters for the warrant officer. The beds in the wards are placed two between each window, so that there will be abundance of light for the patients. The wards will be heated by hot water pipes and by special stoves, and efficient ventilating arrangements have been made for extracting by means of flues the vitiated air. Between the two blocks on the west side a raised promenade will be constructed overlooking Castle Terrace, on which the patients may take the air. It is approached from the court-

yard by a double flight of steps, and between the pillars carrying it there will be seats placed for the patients. The hospital buildings on the Castle side are enclosed by a wall, and for entrance the old Queen Anne pillars will be used. They are to be taken down, and put up in another position from what they now occupy. The courtyard has been formed by removing the old magazine building, which was 74ft. by 41ft., and part of the space thus secured will be laid out as an ornamental ground. The cost of the hospital will be about £18,000. The plans were designed in the War Office, and have been adapted locally by District-Surveyor T. Ivor Moore, R.E.

HISTORICAL STIRLING.

THE old Stirling Bridge of to-day is not the Stirling Bridge whereat King Edward's chivalry went down before the Scottish spearmen. Antiquarians differ as to the site of the more ancient bridge. Some of them hold that it was at Kildean, a little distance up the river; but there seems considerable probability that it spanned the river at the spot where the present old bridge crosses the stream. This structure was built about 1415 by Robert, Duke of Albany, Earl of Fife and Monteath. Of hewn stone, it has four semicircular arches, varying in size one from another, and presents a massive appearance. At the north end of the bridge used to be a gateway with an iron gate. The gateway remained till 1749, when following the settlement of the Highlands, the volume of trade passing over the bridge increased enormously, and necessitated the widening of the roadway. Till 1749 the bridge was the only bridge across the Forth. In 1745 the south arch was blown up by Major-General Blakeney, to stay the march of Prince Charlie's men upon Stirling. Since 1834, however, the bridge has been closed to vehicular traffic. Now it forms one of the many picturesque sights of a picturesque old town. Another interesting Wallace association at Stirling is the Wallace Monument, built by national subscription. The monument is a tower in the Scottish baronial style, 200ft. high, perched upon the summit of the Abbey Craig. It is an object that arrests the eye of every traveller passing Stirling by day train. The foundation stone was laid in 1861 by the Duke of Atholl, Most Worshipful Grand Master Mason of Scotland. In a niche on the south corner outside rises a colossal statue in bronze of Wallace. The hero is figured upholding his mighty sword. The original of the sword, deported from Dumbarton Castle, is to be seen in a glass case in the interior, as well as very fine busts of the Bruce, George Buchanan, Robert Burns, Adam Smith, Walter Scott, John Knox, James Watt, Thomas Carlyle, and other Scottish worthies.

A STONE pulpit has been offered by Mr. Charles Bennett to St. Matthew's Church, Hayfield, as a Diamond Jubilee gift, and another donor is providing a reading-desk of carved oak.

At Kirkgate it is proposed to fit up an electric light installation for the lighting of the square and adjoining alleys at the Kirkgate Market and the Wholesale Fish Market, at an estimated cost of £2000.

The foundation stones of a Hebrew place of worship were recently laid in Templar Street, Leeds. The premises are to include a synagogue 60ft. long by 48ft. wide, with galleries on three sides, providing accommodation for 800 people, robing-rooms, vestry, a school-room with accommodation for about 250 people, and other necessary accommodation.

At the annual general meeting of the Federated Institute of Mining Engineers, held in Edinburgh last week, a paper was read by Mr. James Barton (Dundalk) on the Irish Channel Tunnel project. He stated that the cost of such an undertaking from the Mull of Galloway to the Antrim coast would be between £8,000,000 and £10,000,000, and that the tunnel would take from ten to twelve years to construct. There were no geological difficulties likely to be encountered.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

September 22nd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

AN abominable act of vandalism is in contemplation by the Municipal Council of Rouen. Under the pretext of opening up the cathedral and of converting an irregular and entirely beautiful street into a set thoroughfare, this body proposes to pull down a considerable portion of the Rue Saint-Romain, the most picturesque of all quaint corners, dating from the Middle Ages and the Renaissance, that are the glory of the Normandy city. Among the buildings that are threatened with destruction is a certain house familiar to tourists and to thousands who have never set foot in Rouen, for hardly a *salon* passes that does not contain a picture of it, and it has figured often and often on the walls of the Royal Academy. This exceedingly ancient structure is the property of the State, and every effort is being made to induce the authorities to forbid its being razed to the ground.

WE understand that, whatever plans may be adopted for the erection of new Government offices in the neighbourhood of Parliament Street, access to Boar's Head yard from Delahay Street will be preserved. This quaint old thoroughfare leads into King Street, and is full of interest to the antiquarian. The house occupied by Mrs. Cromwell, mother of the Lord Protector, who also resided here, is said to have stood a little to the north of the yard on the western side of the street, whilst among others who have lived in this narrow lane were Sir Thomas Knyvett, who captured Guy Fawkes; Lord Buckhurst, author of the celebrated song addressed to the gay ladies of Charles II.'s Court; Erasmus Dryden, brother of the immortal John; Mrs. Oldfield, the accomplished actress, and the second Lord North, whose house in the middle of the seventeenth century was remarkable as being the first brick residence in the street.

THE demolition has just been completed of a noted landmark in the south of London—the house where the old toll gate for Lambeth Marshes stood, in Westminster Bridge Road. The directors of the London and South-Western Railway Company have recently given orders for a large extension of the permanent way from Vauxhall to Waterloo station to facilitate the ingress and egress of main line trains, and to ensure this a great deal of property has had to be acquired, among which is the old toll house. After the toll gate disappeared, some enthusiasts had an inscription placed on the building to remind passers by of the house's old associations.

WHEN the improvements which have just been commenced by the Drapers' Company at their fine old premises in Throgmorton Street are carried out, this well-known thoroughfare will present quite an altered appearance. The proposal is, we understand, to substitute for the existing front of the building a number of business offices, and at the same time to make a new and handsome entrance to the hall round the corner in Throgmorton Avenue. It

is not intended to interfere in any way with the spacious quadrangle which is surrounded by a fine piazza of arches supported by columns. The present front, of stone and marble, was built by Herbert Williams, who removed the old gallery, and erected a fine new hall together with a marble staircase.

THERE has just passed away, in his seventieth year, Mr. Downwald Birch, an Artist of whom Sir Edwin Landseer and Sir F. Burton, late director of the National Gallery, both said that had he remained in England he might have been in the first rank. For many years, however, he lived in Italy, following Art for its own sake. At the outset his work showed much of the minuteness of detail and colouring of the pre-Raphaelites, but in his later work he was much influenced by the painters of the Barbizon school, having regard mainly to the spirit of the landscape, the truth of relation, and the breadth of handling which characterise the highest ideal of poetic Art.

AN appeal has been issued on behalf of the reparation of St. Mary's Church in Charing Cross Road, whereof portions—being, it seems, the original south and west walls—are condemned as "dangerous" by the London County Council. The church was built in what was then Hog Lane, since re-named Crown Street, for the Greek community by the Archbishop of Samos, as a Romaic inscription over the west door records. Having passed to a Huguenot congregation, by name of "Les Grecques," it is depicted in Hogarth's print of "Noon," but appears therein as reversed. The church was subsequently used by Independents, and next, in 1850, was taken for the Church of England and dedicated to the Virgin. About twenty years ago the old building was enlarged by a chancel and the addition of a north aisle. A Board School, with a laundry and cookery centre, has lately replaced the southern block of the almshouses, twenty-two in all, which once formed an entire quadrangle around the Greek Church.

THE great influx of workmen, chiefly navvies, into Epsom, owing to the erection of the new asylum for the London County Council on the Horton Manor estate, is causing some concern to the local authorities. There being insufficient lodging accommodation in the town, many of the men sought shelter at the work-house, but, not being destitute, they could not be treated as paupers or casuals. Some tents have been erected in contravention of the bye-laws, and a great number of men are reported to be sleeping in the open air, and finding shelter wherever they can. Two meetings have been held by the Epsom Urban Council to consider the question with a view to taking action under the Housing of the Working Classes Act, and the Council has drawn up a scheme, which, if carried out, would involve the borrowing of £7500 for the erection of fifty cottages (estimated to accommodate 500 men) on their own land. It is calculated that the rents derived from these cottages would yield an annual profit of £100, after allowing for the repayments of instalments of borrowed money with interest. The carrying out of this scheme depends upon any action which the London County Council may take to meet the difficulty, and the Epsom Council is in correspondence with that body on the subject. It has received an intimation that the asylums sub-committee has instructed the architect to communicate with the contractors. The need of accommodation will be felt still more after Christmas, when, it is stated, 1600 men will be engaged on the work, chiefly carpenters and bricklayers.

FROM abbey to farm appears to have been the fate of the grand and almost palatial buildings erected by the various religious orders which at one time flourished in this country. Such was the case with Quarr Abbey, in the parish of Binstead, in the Isle of Wight. This Cistercian Abbey, which was of great extent, was founded in 1132 by Baldwin de Redvers, then lord of the island, and afterwards Earl of Devon. Some of the abbey remains are now incorporated in farm build-

ings, and portions of its foundations were recently excavated. Another abbey farmhouse once formed part of the magnificent buildings of Beeleigh Abbey, in Essex, which was founded in 1180 by Robert de Mantell for the Order of the White Canons, and given at the dissolution of the monasteries to Sir John Gate. The walls are now a patchwork of ancient stone, Middle Age brickwork, and mendings of wooden boards. The fine Architecture of the original may easily be traced behind the modern additions. The monks' refectory, erected in the time of John, the chapter-house of Edward III.'s reign, and the monks' dormitory are still almost entire. On the west side of the refectory is a mantelpiece of Tudor stonework, which in reality is the canopy of the tomb of Henry Beuchier, Earl of Essex and his wife, who lie in the Abbey Church.

THE scheme which has just been sanctioned by the Charity Commissioners for the extension of the picturesque old Hospital of St. Cross, near Winchester, presumably represents the result of the compromise arrived at between the authorities themselves and the many people and antiquarian societies who bitterly opposed any visible alteration in the present aspect of the buildings. A new house for the Master is to be erected, but outside the hospital; and apparently the garden, which was originally to be used as the site for this new house, will not now be tampered with. This is certainly a welcome arrangement, for any addition which would have in any way changed the character of St. Cross would have been a subject for lamentation. Such a relic of mediæval picturesqueness is artistically a veritable treasure-house, and should be maintained most jealously. It would be so easy, even with the best intentions, to do it irreparable damage.

THE outbreak of fire at South Kensington has served to draw attention anew to the dangers which encompass the National Art collections under existing conditions. Very little damage was done; but if the outbreak had occurred in the ramshackle temporary structures which until recently housed so many precious exhibits, the result would probably have been very different. Most of these buildings have now disappeared, but there are still enough of them maintained to give ground for serious apprehension on account of the Museum proper. Probably the incident of the fire will hasten the leisurely proceedings of the Treasury in providing the necessary funds for the completion of the plans of the building. The work, as was stated some time since, has been practically decided upon, and it is really now only a question of the precise method by which the scheme shall be financed.

MR. B. T. BATSFORD's forthcoming publications include "Later Renaissance Architecture in England," by John Belcher and M. E. Macartney, the second and concluding parts; "Bungalows and Country Residences," by R. A. Briggs, fourth edition, with additional plates; "A History of Architecture for the Student, Craftsman, and Amateur," by Professor Banister Fletcher and Banister F. Fletcher, third edition, revised; "The Influence of Materials on Architecture," by Banister F. Fletcher; "Modern Opera Houses and Theatres," by E. C. Sachs, third and concluding volume; "Examples of Old Furniture, English and Foreign," drawn by A. E. Chancellor; "Windows, a Book about Stained and Painted Glass," by Lewis F. Day; "Alphabets, Old and New," selected by Lewis F. Day; "Examples of Greek and Pompeian Decorative Work," measured and drawn by J. Cromar Watt; "Estimating, a Method of Pricing Builders' Quantities for Competitive Work," by George Stephenson, third edition, revised; "Repairs, How to Measure and Value Them," by George Stephenson, second edition, revised.

THE Ecclesiastical Commissioners, it is reported, will decline to accept any site for a new church near the sea along the stretch of east coast from Yarmouth northwards. The matter has arisen at Mundesley, where the old

dispute between the possible restoration and a new building is being fought out. The decision of the Commissioners is certainly a wise one. Visitors to this coast must have been struck by the old deserted churches that stand at the sea's edge at intervals, "solitary wardens of the deep," waiting for the storm that will bring them down as the sea encroaches on the crumbling land. Cromer's old church went under the waves long ago. The old tower at Eccles, of which Chaucer makes mention, went down in the great gale two years ago. The most notable of the remaining old sanctuaries is the Sidestrand tower, which stands amongst its graves right on the cliff's edge. A corner of the old churchyard has already gone down, and some morning the people of the district will undoubtedly look for the familiar old landmark and find it gone.

A SINGLE-SPAN bridge was placed bodily across the Northern Railway in Paris, the other day, having been constructed alongside the line. The Company insisted that traffic should not be interfered with, and this was the only way out of the difficulty. The bridge, 44 metres long, and weighing 400 metric tons, was moved at the rate of ten metres an hour. The operation began at seven a.m., and was successfully concluded about eleven. The bridge, which has been named the Pont Stephenson, connects the Rue Stephenson with the Rue de la Chapelle.

THE contractors selected by the Admiralty tender for the construction of the National Harbour at Dover have received an intimation that the plans and specifications of the works are ready. According to these the tenders should be in the hands of the authorities in a few weeks. The work at the eastern and western ends of the harbour will be proceeded with simultaneously so as to expedite its construction. The lengthening of the Admiralty Pier seaward, which will form the western arm, is to be proceeded with at once, as it is necessary for the protection of the enlarged Continental and commercial harbour which is being constructed by the Harbour Board. Before the eastern arm can be commenced a considerable area of the foreshore under the cliffs is to be reclaimed.

A CORRESPONDENT of the Times describes the physical features of Delagoa Bay, which promises to become an important commercial centre for South Central Africa. The town, which extends for about a mile along the water's edge, is built on ground which has the appearance of having been at one time wholly or partially submerged. Nearest to the water is a bank of sand on which the principal streets are built. Next comes, dividing this bank from the higher ground behind, a low-lying belt or strip, now more or less dry and drained, but which has been till quite recently a mere swamp or marsh, forming a complete boundary to the town and causing an abundance of that malarial fever for which Delagoa has such an evil reputation in South Africa. Of late years a good deal has been done, and is now being done, to drain and fill up "the Swamp," with the result that in winter time, at any rate, it is perfectly dry, while in some parts it has been so completely changed that houses have been and are now being built upon it. Behind the Swamp, again, the ground rises considerably to the north-east, until at Reuben's Point, as already mentioned, the north-east corner of the bay, a height of 280ft. above the sea-level, is reached. On the hill or "Berea" thus formed large numbers of houses are springing up. At the western end is the British Consulate, further east and higher up the telegraph-station, the Governor's house, a look-out-station, and barracks. Every available building site is taken up, many houses of good quality are already completed, others, including an hotel, are in course of construction, while towards the edge of the cliff at its highest part a space has been set aside for public gardens. Lawn-tennis courts and gardens are making their appearance, and it is certain that, within a very short time, what was a desolate and weed-grown bank will

become a popular suburb. Were it not for the existence of another swamp some little distance further north again, from which the wind occasionally blows up the germs of malaria, this hill, exposed as it is to the full force of the sea breeze, would be a perfect sanatorium. Even now it is admittedly the healthiest place of residence. An excellent macadamised road runs from the town to the far end of the hill. Few things, indeed, in Lorenzo Marquez are more appreciated by the visitor, fresh from the dust and abominable roads of Johannesburg and Pretoria, than the hard smooth streets and roads which the municipality has with commendable enterprise substituted for the sand, knee-deep, with which, as shown by the few roads still unmade, the traffic of the town had to contend. The water supply is satisfactory. The sanitation, which is being gradually improved, is in the residential part of the town in no way inferior to that of Johannesburg, while in a very short time the use of the electric light will be universal.

THE preparation of the stained glass windows which have been presented to St. Paul's Cathedral by the Duke of Westminster has been somewhat delayed by necessary structural alterations, and also by the absence of the artist, Sir W. B. Richmond, on the Continent. The windows are to be placed in the north and south transepts, and one of them is now complete at the works of the makers, Messrs. Powell, of the Whitefriars Glassworks. The design for the other window is finished, and these two handsome additions to the decorations of St. Paul's will soon be in position. The general features, it is unnecessary to add, are thoroughly in keeping with the richly ornate, though severely criticised, mosaics which are also being arranged by Sir William Richmond.

THERE WAS a large attendance at Tokenhouse Yard on Tuesday week, when Mr. Franklin Homan again submitted to public auction the extraordinary edifice known as Jezreel's Tower, which occupies an elevated position on the hill near Chatham. The order of the Jezreelites was started by a private soldier named White, who assumed the name of James Jerishom Jezreel, and when he had collected sufficient funds he built the tower for the housing of 144,000 of the people who "were not to taste death." The founder of the order, however, passed away before the tower was finished, and his wife, who was known as Queen Esther, also proved a bad advertisement for the new doctrine, for she likewise died. Offered with the tower were seven acres of garden ground, two brick-built cottages, and a timber-built blacksmith's forge, stables, cowhouse, and other outbuildings. The interior above the ground floor is arranged for a circular assembly hall to seat 5000 people. At one end is a restaurant, and there are large dormitories for men and women, numerous bedrooms, and other offices. The auctioneer started the bidding at £3000, and after rises of £100 and £50, withdrew the property at £3950.

ONE often hears in a gallery interesting details about the pictures, all the more striking when you are able to compare what is said with the work criticised or talked about. In the Tate Gallery a day or two ago a visitor was admiring Millais' "Ophelia," and pointing out its excellencies to country cousins. He seemed to know his subject well, he spoke with authority, and he told this story about the little canvas. E. M. Ward and its painter were friends, and disliked each other's technique, and made no secret of their opinions. When the picture was first exhibited, and awoke no small admiration and controversy, Ward came up to Millais and asked him what he called his work. Said Millais, "I call it Ophelia." Said Ward, "I call it Oh Failure." Some years afterwards Ward painted his Charlotte Corday, and Millais in the presence of its painter eagerly studied the much admired picture. Ward waited for the words of approval to which he had become accustomed. All Millais said was "Tell me, where do you get your cadmium?"

AMONG the recent additions to the Egyptian Department of the British Museum are two very well finished busts of the period of the later Ptolomies. Although these works of Art are rather small compared with some of the remains of that period, nevertheless they may be said to represent a marked Greek influence upon the usually heavy Egyptian style. There is also a granite figure of the goddess Serk, represented as holding a shrine upon which at a very early period was inscribed an invocation to that goddess. This inscription, however, has now almost entirely disappeared, only a few of the hieroglyphs being decipherable. Monuments of this description were usually either the property of private persons and used as household gods, or else they were buried with the mummy, and hence became funeral objects. A portion of the statue of a king has also recently been added, and it is much to be regretted that as it bears no inscription the authorities are unable to fix its date.

AN interesting exhibition has been opened at the gallery of Messrs. Graves and Company, 44, Cherry Street, Birmingham. It consists of pictures by Mr. Buxton Knight, and sculpture by Mr. Albert Toft. The examples of statuary are principally in plastic material, but include several bronzes. They are twenty-three in number, and among them are works that have been exhibited at the Royal Academy and New Gallery. Mr. A. W. Wills lends the fine bronze figure of "Lilith" toying with the serpent. Of similar size, but of a wholly different character, is a bronze figure entitled "Evening." It is an admirable illustration of the success with which Mr. Toft has in so many instances embodied subtle sentiment in the lines of his figures. Very delicate, and animated with a clear expression of sentiment, is a tinted statuette entitled "Spring"; while the draped figure with upraised hands, entitled "The Invocation," and a head and neck to which the artist has given the name "A Vision," also show intensity in the portrayal of idea. The original plaster sketch of a large panel, "Age and the Angel of Death," is among the more important items. The works of Mr. Buxton Knight were recently on view in London.

AN extension is in progress in connection with the underground electric railway which runs from Stockwell to the City side of London Bridge. The City and South London Railway is the full description of this line. The route comes quite close to the familiar church of St. Mary Woolnoth. It stands at the junction of King William Street and Lombard Street—that is to say, just where they approach the Mansion House. A station was necessary here, and it is to be built immediately under St. Mary Woolnoth. There was a church on this site as early as 1355, and the present one was built between the years 1716-1719. The architect was Nicholas Hawksmoor, one of Wren's pupils, and St. George's, Bloomsbury, also pertains to him. The point, however, has been this: How to preserve St. Mary Woolnoth intact, as stable as it has been, and at the same time get the station and the railway? It is doubtful if any engineering feat, involving quite the same difficulties, has ever had to be dealt with in England. In a word, the old foundations—or most of them—must be removed and a new method of supporting the church introduced. The south wall needed to be entirely supported on steel girders, and the north wall partially. Most difficult of all, a new foundation was essential for twelve stone columns, which supported the central structure. The central structure weighs, perhaps, 500 tons, the north wall the same, and the south wall 350 tons—an entire weight of about 1400 tons. The central part of the site upon which the church stands is especially important, in that a great elevator will be placed there. It will carry passengers to and from the level of the station down below, and there will be connection with it from Lombard Street and King William Street. The engineers for the new railway are Sir Benjamin Baker and Mr. David Hay, while Mr. James Forgie is the resident engineer. Messrs. John Mowlem and Co. are the contractors.

An anecdote told by Mr. M. H. Spielmann with reference to the purchase of the drawing, "Merlin and Nimue," by Sir Edward Burne-Jones as an addition to the South Kensington Museum collection, throws a curious light upon the way in which the funds of that institution are managed. This particular drawing cost £800, and as the total annual grant for the extension of the water-colour collection is only £700, the extra £100 had to be provided out of money voted for other purposes. Yet by the Science and Art Department report just issued it appears that a further sum of £616 was spent in the same year on water-colour drawings, so that, as Mr. Spielmann points out, the total over-draft of the vote for drawings amounts to more than £700. It would certainly be interesting to know by what rearrangement of accounts a proper balance was struck.

THE sequel to the incident at a recent meeting of the Dover Town Council was introduced at a subsequent meeting, when Councillor Mackenzie, a local magistrate, gave notice to rescind the resolution passed that the repair of the damaged window in the grand hall of the Maison Dieu, known as Henry VIII.'s window, should stand over "until the holes got bigger." The Councillor said it was a scandal that, having such a property, the Council should refuse to preserve it. The Council had made itself the laughing stock of the whole country. Alderman Peake said that the Council was quite competent to do its own business without outside influences (?). Alderman Adcock suggested that as a way out of the difficulty Messrs. Clayton and Bell, who built the window, should be asked for an estimate which could be compared with that already received. Councillor Edwin said that a local tradesman could do the work. The holes were only 4in. or 5in. wide. Several Councillors subsequently inspected the window, and it was then seen that there were cracks in several panels immediately surrounding the holes.

AN interesting discovery in the way of inscribed stones and coins has been made at the Roman camp of *Æsica*, which is situated about two miles and a half north of Haltwhistle, and where excavations have been in progress during the past two years, under the direction of a committee formed in connection with the Newcastle Society of Antiquaries. Previous to this interesting discovery of the past few days, a good deal of excavation has been going on at this place, but hitherto the fragments of inscribed stones that have been turned up have been few and unimportant. Between the west gateway and the north-west angle of the camp is an extensive range of buildings erected against the inside of the western wall. Behind a stone trough near a hearth, in one of these, which seems to have been a smithy, were unearthed about twenty silver denarii of the earlier Emperors. In an adjoining building a quantity of charred wheat was found, the grains of which still retained their shape. At the north-west angle the great wall joins the camp. (By the great wall is meant the great stone wall extending from Tyne to Solway, and known as the "Murus," and which is frequently described as "Hadrian's Wall.") During the course of the excavations large quantities of pottery were turned up, chiefly consisting of the grey smother-kiln ware. A few small fragments of the parti-coloured Durobirian ware and much of the beautiful red Saurian ware were also found. Two fragments of the latter had on them, scratched through the glaze, graffiti of names of centuries that have also been found on centurial stones in that district.

A CONTEMPORARY points out that a Belgian syndicate is getting all the contracts for material for the Trans-Siberian railway, and then asks, "What are Englishmen doing to allow these Belgians to get all the plums?" The answer, says the Globe, is simple and "striking!"

THE death has taken place at Chelsea of Mr. J. Milo Griffith, the Welsh sculptor. When a boy in Pembrokeshire he commenced carving

heads in stone under difficulties, for his father, a stern Calvinist, broke one of them, saying he would have no carved images in his house. With his mother's cognisance, however, he worked in an outhouse, and afterwards obtained such technical instruction as was available. He first came to the fore at the restoration of Llandaff Cathedral, where he carved many of the stone capitals; but it was in 1870 that, at an industrial exhibition, his work attracted attention, and he presented several specimens of his carving to the Cardiff Free Library. His statues of John Batchelor at Cardiff and of Sir Hugh Owen at Carnarvon increased his reputation, and the Royal Cambrian Society subsequently employed him. In 1883 he commenced exhibiting at the Royal Academy, and ten years later he sent in six pieces and eight to the Walker Art Gallery at Liverpool. One of his Academy pieces, "The Flower Girl," was bought by Mr. Talbot, the then father of the House of Commons. In 1888 he designed the silver shield given to the Prince and Princess of Wales from South Wales, and later he went over to the Chicago Exhibition, and was for some time Professor of Art in a college at San Francisco. One of his most successful works was a statue of St. Brelia in marble, and he was the inventor of the Helix button. His last work was a design for the proposed national memorial to Llewelyn ap Gruffydd, which he sent for exhibition to the recent National Eisteddfod at Newport.

AN interesting discovery of skeletons has been made just outside the city, in the course of excavations made for laying drainage pipes. Some of the skeletons, which are supposed to date back to the time of the Romans, were perfect, but collapsed upon attempt being made to remove them. Others, however, were dug out in a fairly perfect condition, and have been removed. There are skeletons of horses, and the site on which they were found was probably at one time the scene of a pitched battle, and may possibly be an old burying ground.

THE discovery of the tombs of David and his successors, the Kings of Judah, is a problem that has hitherto baffled Palestinian archaeologists, although they do not despair of its solution. There is a curve in the famous tunnel in the Valley of Siloam, before it enters the Pool. It is quite unnecessary, save for the avoiding of some other structure, and it has been thought that this might be the tombs of the Kings. Dr. Bliss has recently made some excavations, but with no result. M. Clermont Ganneau writes pointing out that the clearance made by Dr. Bliss to the south of the curve is completely outside the area indicated by him as a probable site. Dr. Bliss dug to the south of the curve, outside its convex side, instead of inside the concave side, which naturally encloses the object it was desired to avoid, assuming that was the reason for the deviation. The ground marked by M. Clermont Ganneau is between the curve of the tunnel, and the intersection of the path descending from the south-east angle of the walls enclosing the Temple area. He suggests, moreover, that it is a pit or well entrance that should be looked for, not a doorway similar to those of ordinary ancient Jewish tombs, and he bases this upon a passage in Josephus who says that Herod, having pillaged the Royal vaults, constructed a monument to atone for his conduct on the mouth of the vault. This pit entrance would probably be relatively small, just large enough to admit a sarcophagus, thus rendering the task of discovery more difficult.

ONE of the most wretched districts in the East End of London has disproved in an effective manner the foolish heresies that used to be preached when the London County Council tried to force the doctrine of betterment on the House of Commons. The doctrine, by the way, appears to be abandoned for the present, as we never hear anything of it now. Betterment was alleged to be an act of justice, on the ground that only in that way could owners be compelled to contribute to public improvements. St. Luke's has

proved that owners do contribute, by the higher rates paid by the tenant, seeing that the rate is practically a deduction from the rent that otherwise would be paid. St. Luke's possessed, among other slums, the notorious Golden Lane, which almost everyone has heard of. The squalid rookeries in the Golden Lane district have been swept away, spacious new streets lined with good property built, and the locality has now become an important commercial centre.

THE scheme for the erection of a college at Dartmouth for navel cadets has been suspended, and it is probable that it will be abandoned in favour of a building near Portsmouth. Several months ago sketch plans were prepared by the Chief Constructor's Department at Devonport, by the direction of the Admiralty. These plans have now been returned to Devonport, with an intimation that nothing further is to be done in the matter. The probable abandonment of the Dartmouth scheme is believed to be due to legal difficulties in connection with the acquisition of the site, which is in Chancery.

MESSRS. POWELL write: "We observe that a block of houses has been pulled down in Holborn lately, and preparations made for rebuilding. Now these are just on the spot where many persons think it is necessary to relieve the cross traffic from Holborn to the Strand. The opportunity should be seized by the London County Council or the Holborn Board of Works to purchase a slice of this ground and set back the frontage some 10ft. or 12ft., thereby relieving the traffic immensely. Many thousands of pounds could be saved by taking advantage of opportunities like this, rather than by buying large houses at fancy prices, and paying compensation to tenants for goodwill besides. By widening Holborn at this spot there would be space gained for enabling vehicles to get out of the *mêlée* and keep the traffic flowing." The site referred to above is situated on the north side of Holborn, between Southampton Row and Kingsgate Street.

THE selection of a site in Greenwich Park for the magnetic pavilion has given much trouble, but one which appears in every respect suitable has been found on the east side of the Observatory, at a distance of between 300 and 400 yards.

VISITORS to the Paris Exhibition of 1900 will find that some extensive changes have been made in order to provide commodious approaches. Amongst these is to be a new Pont-au-Change, which, with the Pont St. Michel and the short Boulevard du Palais between the two bridges, joins the ends of the long, wide, and straight Boulevards St. Michel and De Sebastopol. It is in situation the oldest of the many bridges in Paris. The first one, built of wood in or before the tenth century, between the Ile de la Cité and what is now the Place du Chatelet, was for a long period the only one across the Seine. Louis VII. established a Bourse or Exchange close by, and erected houses along both sides of the bridge, which in 1141 meantime had been repaired with wood and stone, whereupon its name was altered from Grand Pont to Pont-au-Change. Having been swept away by a storm in the thirteenth century, it was replaced with another, entirely of wood. That was burnt in 1640. The successor, of stone, was relieved of its load of houses in 1788, and then widened and, in effect, reconstructed in 1858-9. Our own oldest bridge in London cannot boast of so varied a history, nor did it form the capital's fashionable lounge, as did the Pont-au-Change until the close of the sixteenth century.

THE scheme of decoration for the Nelson Column in Trafalgar Square by the Navy League on the anniversary of Trafalgar, on the 21st prox., will be carried out on a somewhat different plan to that adopted last year. The present intention is to erect an enormous crown on each side of the column and about half-way up, from which huge lengths of twisted laurel will depend as far as the lions.

THE London docks afford a very curious and interesting indication of what is going on—and what is not going on—all over the world for those who can read it. One item in a ship's cargo discharging in the Albert Docks a few days ago was 1000 tons of slates from America. The American quarries have been busy with the work that has not been done during the past twelve months on Lord Penrhyn's estate. It is said that not only roofing slates, but the large and expensive slabs required for bagatelle and billiard tables have been brought in large quantities from the other side of the Atlantic during the North Welsh suspension of work. Whether, having once found the market, the transatlantic quarries will continue to hold it, remains to be seen.

A GREAT amount of local interest has been taken in the new cross which has just been unveiled in the parish churchyard at Folkestone. In former days the mayor was elected on the site of this cross, the inhabitants being annually called together for the purpose on the "Feast of the Nativity of our Blessed Ladye" by the blowing of a horn, which is still preserved in the council chamber of the town. The cross on which the ceremony was observed in those days has long since been demolished, but the steps on which it had been erected remained, and on these a sun-dial had taken its place. The new cross has cost close upon £300, which sum has been subscribed by the townspeople.

THE discovery of a valuable Murillo is reported from Copenhagen. The canvas was found in a dealer's possession, and M. De la Rue has no doubt of its genuineness. He estimates its value at 600,000 francs. It is believed that the picture is one painted by Murillo for the Jesuit monastery of San Ignacio de Loyola, in San Sebastian. The middle portion is well preserved, and is distinguished by the freshness and warmth of the colours, while the upper part has apparently been somewhat unskillfully restored by a northern artist. It is thought that it was removed from the monastery during the French invasion, and that at some subsequent time it was taken to England. Of its further history all that is known is that it was sold to a Norwegian by an Englishman on condition that it should not be offered for sale, a circumstance which seems to indicate that it was at one time stolen. It probably came to Denmark about 1820. M. De la Rue believes that inquiries about the canvas must have been published at some time, that it was subsequently forgotten, and that no competent critic has had an opportunity of examining it.

At an interim meeting of the managers of the Metropolitan Asylums District, copies of an order authorising the managers to purchase from the Corporation certain land on the Victoria Embankment at the corner of Carmelite Street as a site for new offices, at a sum not exceeding £53,000, were laid before the Board. Authority was given for the borrowing of the amount, with a sum not exceeding £250 to cover expenses connected with the purchase. The Chairman moved that the question should be referred to the Works Committee in order that the members might submit the name of an architect to prepare plans of the new building. No further delay, he said, ought to take place. Mr. P. Wells moved as an amendment that the Works Committee should bring up the names of three architects. After some discussion, the amendment was carried by a small majority, and adopted as a substantive motion. The Local Government Board has decided to sanction the purchase.

If it is true that the Marquis of Bute has bought Pluscardine Abbey from the Duke of Fife for the purpose of restoring it for religious use, it is a pity that he did not decide to build a brand new monastery somewhere else instead of tinkering up an old one. Pluscardine was founded in the earlier half of the thirteenth century—that golden age of monastic institutions—and was one of the three Cistercian houses in Scotland. The

abbey church, like most of its kind, was cruciform. What is left of it now are the ruins of the choir, the transepts, the eastern aisles, and the central tower. The vestiges of our ancient abbeys are the fairest memorials in our land of the past that is dead, and as such they have a beauty and a meaning that would be destroyed in the attempt to restore them to a life that belonged to another age. To interfere with the relics of the old religious foundations which justly command our veneration by a mimic reproduction of the conditions which called them into being is to take away their sanctity. By all means let Lord Bute found a new abbey if he is so minded, but let him spare the ruins of the old ones.

CONSIDERABLE restorations are contemplated at Chichester Cathedral, including the rebuilding of the North-west tower. This tower is entirely detached from the body of the edifice, after the manner of an Italian campanile, and it is, we believe, the only example in this country. Rugged and time-worn, it is an imposing and venerable relic of the past. It is to be hoped that it will not be renovated out of all its character. The plans for the restorations have been worked out by Mr. J. L. Pearson, R.A.

ARRANGEMENTS have been practically completed for the removal next month of the Government Laboratory from Somerset House to the new premises near Clare Market. Professor Thorpe, the principal, has personally interested himself in seeing that every modern improvement has been introduced into the new premises, which, outwardly unpretentious, will internally be as near perfection as possible. Indeed, it is anticipated that the institution will soon come to be acknowledged as the most important general practical laboratory in the kingdom.

"HERE lived Prince Louis Lucien Bonaparte from 1854 to 1891." Such is the inscription in letters of gold on a blue ground which has appeared within the last few days upon the double-fronted house in Westbourne Grove, where the last of the great Corsican's nephews spent his declining years. The tablet has not been set up by the Society of Arts, but owes its existence to the pious impulse of the speculator who bought the freehold from the Prince's widow, and is now converting it into residential flats. Soon there will not be a trace left of the semi-imperial splendour that adorned the old scholar's home. The library has passed into the hands of the trade; the pictures, engravings, statues, and fountain have been carried off by the family. Nothing remains save two or three elaborate marble mantelpieces, brought from Italy at great cost, and bearing the initial "N" with the Imperial eagle.

THE first hotel in Spitzbergen erected in our times (for at least several inns existed in previous centuries, now extinct) is also the most northern hotel in the world. It is thus described in the "Vossische Zeitung": "Built in Norwegian style, has a large hall, and a quantity of smaller rooms, with thirty beds."

MR. ASTON WEBB, writing to the Times, from 19, Queen Anne's Gate, Westminster, says:—"Will you allow me, as an occupier for many years of one of the houses most affected by the alterations now in progress, to endorse entirely Mr. Edmund Phipps' letter to you on this subject? The laying down of asphalt is bad enough, but the obliteration of the corner as described by Mr. Phipps appears to inconvenience no one, and can be regarded as simply a wonton and ruthless interference with one of the best remnants of early eighteenth-century architecture still existing in London. This quiet corner asked for nothing to 'improve' it, and wanted nothing except to be left alone. Why, then, should the vestry try to spoil it?"

THE municipal authorities all over Europe need to be watched by the higher authority of

the State in order to prevent them from wilful demolition of their most valuable and often least valued treasures. Probably there are some English tourists who are familiar with the splendid mediæval "Wasserthurm" in the little town of Liestal, the capital of the half canton of Baseland. At a meeting of the Gemeindeversammlung a few days ago it was put to the vote whether this fine old monument should be pulled down. By a majority of 179 votes against 135 its destruction was resolved upon. The only hope of its preservation lies in the prompt intervention of the Swiss Society for the Preservation of National Monuments.

LORD DERBY, in opening a technical school at Preston, observed that he did not wish to speak disparagingly of Art, but in a land like ours the future depended more upon technical work than upon Art. In Germany the people had a thorough education and complete technical training. When Englishmen spoke disparagingly of German productions, he was not sure that there was not occasionally a note of envy to be detected. Germany was advancing at a great rate, and England was content to go a little slower. Whilst we had advanced much these last fifteen years, others had done so still more, and he urged that, throughout the kingdom, education should not be regarded as an abstract possession, but should be vigorously applied to the better conduct of our trade. Lancashire was a proud leader in technical work, and her sons and daughters must work on with courage and resolution to more than maintain her strength.

THE artists who are to decorate the foyer of the new Paris Opéra Comique have just been selected. The ceiling is to be painted by M. Aimé Morot, and MM. Falguière and Antonin Mercié are each to be entrusted with a statue. One of the statues, that to be executed by M. Mercié, is to represent the art of dancing, and, according to the gossip of the Boulevard, it was M. Falguière's sensational treatment of this subject in a statue exhibited at last year's salon that prevented this artist from obtaining the order for both works of Art.

FOR some time past the governors of the Holywell Intermediate School, now being erected in a field at Penymaes, near the town, have been sinking in search of water. To this end they engaged the services of a well known water-finder, Mr. J. Stone, of Spilsby, who indicated two or three spots where water might be found. The first was successful, but unfortunately in sinking deeper the water was lost. Under these circumstances a new well was sunk in one of the alternate sites pointed out by Mr. Stone, and at a depth of 65ft. an excellent supply, yielding 2000 gallons a day, has been obtained.

THE Tramway Company of the Huddersfield Corporation is considering several important proposals to extend the Huddersfield Corporation Tramways to outlying parts of the borough. The propositions, which will be submitted to the Council in due course for approval, include the following:—To construct a double line of rails from New Street, from the point where a double line already exists, along Buxton Road to Chapel Hill; to lay a tramway, 1600yds. long, from the present terminus at Paddock to Longwood; another, 1600yds. long, from Fartown Bar to Sheepscroft; another, 1400yds. long, from Crosland Moor Bottom to the borough boundary on the Manchester Road; and another from the Salendine Nook terminus to Out Lane. Most of these proposals have been before the Council on former occasions and rejected.

It is with regret that we have to announce the death of Mr. George Kenyon, of 68, South Audley Street, and Broad Sanctuary Chambers, S.W. Mr. Kenyon's decease will be deeply regretted by his many friends, and we have ourselves many kindly thoughts of one who on several occasions had shown us marked courtesy.

Surveying and Sanitary SUPPLEMENT.

SEPTEMBER 22ND, 1897.

The Sanitary Congress at Leeds.

WE have been told that there is beginning to be a general feeling in the majority of towns that the time has come when, in the matter of sanitary advancement, we should rest and be thankful. This, in days when the progress of sanitary science has passed out of a canter into a gallop, is a dictum which perilously approaches the absurd; and were evidence of accentuated vitality in this connection necessary, it was afforded last week at Leeds at the Congress and Health Exhibition of the Sanitary Institute. The aim of the Institute is wide and comprehensible; it is, briefly, to preach the gospel of health and true hygienic faith, and, by such means as a representative Exhibition of modern sanitary appliances and apparatus affords, to demonstrate the practical application of its teachings. The President of the Institute, in reviewing the sanitary situation of to-day, was able to report that we are "progressing favourably"—in fact, to congratulate his fellow members on the marked approach towards more healthy conditions of life among our vast populations; though at the same time he could not remain silent on the dangers still encircling us on every side, and of the increasing mortality due to certain forms of disease. Not the least interesting of the many references contained in Dr. Farquharson's speech was that to the need for the appointment of a Minister of Public Health, and in his advocacy here, we doubt not that he has the warm support of the great body of sanitarians, who, with him, are not content to rest merely on the record of the past quarter of a century. Of course the public aversion to stringent sanitary regulations prompts objection to the creation of a Government Department of Health, and we are told that present needs are amply met by the Local Government Board. It is, however, merely a matter of time when such health department will be formed. It is important that local authorities should be alive to the abuses to be dealt with in the interest of health, and it is to this end that the present Congress and Exhibition attains its greatest measure of utility. We give a summary of the congressional proceedings, but are compelled to withhold our report of the Exhibition.

The President (Dr. Farquharson, M.P.), in his opening address, said that the work of the Institute had now passed through three distinct stages. Having at first been ridiculed and afterwards opposed, it had finally come to be accepted by public opinion. Ventilators were no longer stuffed up; the working classes, no less than their employers, were

beginning to be connoisseurs in the quality of their atmospheric conditions, enjoyed a good wash as much as a University graduate, and were fully prepared to appreciate the advantages of hygienic house accommodation at other people's expense; so that the Institute had reached the stage of enthusiastic acceptance and universal approval, and the sanitary reformer was as much petted and caressed as he was once scouted and despised. No properly instructed person, in these enlightened days, would dream of taking a house without a thorough inspection of, and report upon, its sanitary arrangements; while water analysis and food analysis kept us fairly free from adulteration, and most of us knew pretty well the amount of help given us by the law in keeping our health fairly sound. During the last quarter of a century, the English death-rate had been reduced from twenty-two to eighteen per annum, by

THE JOINT LABOURS OF SANITARIANS

in the prevention of disease, and of doctors in curing it. He quoted Professor Matthew Hay, of Aberdeen, to the effect that no great further reduction could reasonably be expected. A death-rate of only ten per 1000 would mean that everybody born would live to be 100 years old. Probably it would be found that the natural elements of decay in men, as in all living things, which made eventually for death, independently of environment, would not permit of a lower general death-rate than about fourteen to fifteen, even under the most favourable hygienic conditions, being reasonably attainable. So that by the time we had gone as far in reducing the death-rate as we had come in the past quarter of a century, we should have reached the ultimate *minimum*. But it would certainly not be in another quarter of a century. After a glance at the excellent sanitary work done by the officials of the Local Government Board, under the direction successively of Sir John Simon, Sir George Buchanan, and Sir Richard Thorne-Thorne, as well as at the writings of Mr. Fridgin Teale and Professor Corfield, Dr. Farquharson spoke of the improvement which had been effected in the health and comfort of the members of the House of Commons by the exclusion of sewer gas from the building some ten or twelve years ago. This sanitary operation had been of national importance in improving the health and temper of our senators and enhancing the quality of their work. Dr. Farquharson next sketched some of the

DANGERS TO HEALTH

which seem to be inseparable from the crowding together of great populations in towns, and discussed the means by which these dangers might be diminished. Among those dangers he made special mention of diphtheria, and explained its increase, in the words of a private

communication from Sir R. Thorne Thorne, as being due to the herding of our child population in elementary schools at the very age at which they are most susceptible of the disease. The increase in diseases of the nervous system, and especially insanity, was referred to, and attributed to the increasing stress of modern life; and the most pressing sanitary questions of the day, such as the supervision of meat supplies and of slaughter-houses, and the provision, wherever possible, of extra-urban dwellings for the working classes, were briefly considered. The president entertained a very poor opinion of the House of Commons in its dealings with public health. Both sides, he declared, were bad, but that to which he belonged was the worst, for a deep-rooted suspicion of scientific methods and of progressive sanitation existed in certain Radical quarters, and abstract views of personal liberty and distrust of the so-called tyranny of doctors swayed a kind of plausible sentiment which was usually irresistible in its paralysing effects upon hygienic legislation. In such a state of feeling, a private member could do nothing until sanitary questions were taken up by the Government of the day. He looked forward to the appointment of a Minister of Public Health as the means, eventually, of obtaining for these questions the consideration which their importance demanded. The proceedings were continued

ON WEDNESDAY,

the second day, when, in the Town Hall, School Board Offices, and elsewhere, conferences on various subjects were held. Major L. Flower, who presided at the conference on River Pollution, said that years of experience had confirmed the opinion he held in 1876, that if we were to have our rivers purified the whole country should be mapped out into districts, each under a competent sanitary officer, who should have large powers under conservancy boards formed to legalise his acts. There was not a single pollution for which there was not a remedy. If not already shown, chemical science was sure to find some means of purifying or cleaning effluents from factories which would be effective and remunerative; and if manufacturers ceased to discharge refuse into the sewers, the treatment of sewage at the outfall would be rendered less difficult. Major Flower dealt with legislation on the subject, which he contended was inefficient. He held that the remedies were mainly improved legislation, the abolishing of all special clauses, and the making

THE FOULING OF STREAMS

a penal offence. Much might be done by individual action, but with respect to river pollution no half measures must be adopted. What the country required was a firm and sound Act of Parliament having compulsory

powers entrusted to competent men to carry out, administered in each watershed by a man who, by his personal influence, could induce polluters to abate their nuisance—not necessarily an autocrat, but one who knew how to exercise the duty entrusted to him with judgment and firmness, governed by conservancy boards to legalise the acts of such officials. The thing which lay at the root of the matter was waste, and he advocated that the sewage of a country should be returned to the land to produce a fresh supply of food. They should try to get rid of the sewage at a reasonable cost, but if at a loss, the preservation of springs, streams, and rivers from poisonous contamination was of infinitely greater importance. There was an enormous amount of waste in the discharge of trade refuse into streams, but these products might be turned to value for the good of the manufacturer, as well as for the good of the country. In conclusion, he remarked that, looking to the question from all points of view, and well-nigh in despair of obtaining such an enactment as would coincide with the views of all persons interested, why should they not combine in a guild, and endeavour to

BRING CO-OPERATIVE PRINCIPLES TO THEIR AID?

Let the members of that league act upon the principles which had governed the Fisheries Preservation Association. He submitted that such an Association was quite possible, and if properly organised might meet with the success which had been remarkable in other societies with different objects.—Dr. G. Sims Woodhead followed with an interesting address on the various processes taking place in tidal estuaries, which had for so long been regarded as receptacles for sewage. It was essential that these estuaries should be relieved of the sewage matter usually deposited there, and he thought that in the near future they should work hard to keep out of such estuaries all sewage matter whatever.—Mr. R. E. Middleton, in a paper on "River Pollution from an Engineer's Point of View," said no chemical treatment of sewage was sufficient to produce an effluent of satisfactory purity. All sewage matter might be efficiently treated by filtration through sand and gravel in the same way as water was filtered, though at a slower rate, and with more frequent periods of intermission. The Local Government Board were opposed to this system unless it was supplemented by an area of land sufficient to purify the sewage, should the filter break down. This, although apparently a short-sighted policy, was not really so, owing to the want of care and attention which many sewage disposal works received.—In the medical officers' section, a paper was read by Dr. J. Brown on "Poisoning from Canned Foods, with Suggestions on Prevention." At a conference of ladies, Mr. Fawkes, who presided, congratulated the women upon the official recognition they had received from public sanitary authorities. The first woman inspector was appointed by the Nottingham Corporation in 1892. Since that date eighteen others had been appointed in various localities. A resolution, calling attention to the good work that has been done in Manchester and other large cities by women inspectors, and urging the desirableness of one or more women being appointed in Leeds, was passed. A discussion followed the reading of a paper by Mrs. R. W. Eddison, dealing with the work of the Health Department of the Yorkshire Ladies' Council of Education. In the sanitary inspectors' section, Mr. P. Fyfe, of Glasgow, pleaded earnestly that inspectors should become more united, and that the fruits of union would soon be reaped by every man in the United Kingdom who bore the official badge of a sanitary authority. Of the several sectional meetings of the congress held

ON THURSDAY

the third day, the most interest was evidently taken in that devoted to sanitary science and preventive medicine, the president being Mr. T. Prigdin Teale. His opening address mentioned the fact that it was 20 years since there was a public discussion in Leeds on sanitary science. But now medical science was concerning itself

more and more with the tracking to their source of the origins of diseases with a view to prevention, and was no longer content merely to repair the ravages of disease which ought to have been prevented. Sanitary science worked as the handmaid of medicine in discovering the methods by which the evils of disease could be averted. Preventive medicine was a new science, and had the vigour and enthusiasm of youth.—In this section Dr. Spottiswoode Cameron, the Leeds medical officer, introduced the subject of disinfection, and explained the methods carried out in Leeds for the purpose.—Professor Delpine followed with some practical remarks on the same subject, and especially recommended the general utilisation of certain vapours.—Mr. H. Kenwood contributed a paper on the disinfection of rooms by the use of these vapours.—Notes on the examination of disinfectants by Mr. W. De Fries and a paper by Professor E. F. Trevelyan on the action of diphtheria bacillus outside the human body and the prevention of disease followed.

THE ENGINEERING AND ARCHITECTURE SECTION

of the congress was presided over by Mr. Lewis Angell, who in his address said the most striking feature of the Victorian era was the development of the practical and useful. It was not until the reign of Victoria—and almost identical with Her Majesty's accession—that the professional civil engineer came into existence, a profession of which England was the origin and the cradle. Engineering and architecture represented the constructive side of sanitary science. He then went on to trace the rise of the present system of sewers and of the new Pollution Acts, and passed to the subject of house sanitation. He maintained that all living rooms should have ample means of ventilation, and that there should be no connections between the dietetic water supply and the drains. The housing of the working classes was a prominent feature in sanitation, and whether this should be accomplished by flats or by workmen's trains was a matter for serious consideration. It was not by legislation or officialism that real progress was to be made, but in the education of the people.—A paper by Mr. E. T. Hall on "Fever Hospital Construction" followed. He emphasised the importance of segregation of persons inflicted with infectious diseases. The site should be on open ground and elevated, but one with steep slopes should be avoided. The heating of wards was best done by low-pressure hot water radiators. The paper also dealt exhaustively with wards and ward accessories—doors, windows, sinks, laundries, and water supply—and concluded by urging on all local authorities the desirability of making their hospitals architectural in treatment.—An address was delivered at the close of the other proceedings by Mr. H. Percy Boulnois on the sanitary advances in municipal engineering.

At the Hyde Borough Police Court the Town Clerk applied for an extension for three months of the order made by the magistrates on November 12th last, that within nine months the Hyde Corporation should apply to the Local Government Board to sanction a loan for the extension of the sewage works. The delay was caused by difficulties in preparing a filtration scheme.

DR. RICHARD JONES has compiled a valuable report and tables which prove that sanitation in the county of Merioneth is defective. During the year, 1337 cases of infectious diseases have been notified, as compared with 636 in 1893. There are no infectious diseases hospitals in the county except the workhouses and one private hospital; and, in order to stamp out these infectious diseases, the medical officer declares that infectious diseases hospitals are absolutely necessary. Proceeding, he deals with the lack of suitable dwelling-houses, and says that in some districts great overcrowding exists, and that the house accommodation of the working classes is far from what it ought to be.

Surveying and Sanitary Notes.

At a meeting of the Water and Sewers Committee of the Swansea Corporation on Tuesday week, a discussion took place as to the continual flooding of the lower parts of the town, which forms a grievous source of complaint. In reply to Mr. Freedman, the Chairman (Mr. W. Watkins) admitted that the town had practically outgrown its drainage system. The Borough Engineer said the pipes were too small, and ought to be re-laid—in parts, at any rate.

THE Altofts Urban District Council has applied to the Local Government Board for permission to borrow £5500 for the construction of new sewage works. Mr. H. H. Law, Local Government Board Inspector, has held an inquiry relative to the application.—Mr. J. Richardson, consulting engineer, explained that the present sewers will be utilised, but the works will be entirely reconstructed on the site of the old ones.—In answer to the Inspector, it was stated that at present the sludge from the tanks was spread over the filtration area.—The Inspector expressed surprise at this state of things, and remarked that he could quite understand, under these circumstances, that the Council did not get a decent effluent, and that the Rivers Board was taking action in the matter.

THE members of the Peterhead Town Council recently visited the sources of the water supply of the town. After inspecting the Grange reservoir, which has a holding capacity of 700,000 gallons, and which was found to be in good order, the company drove to the new reservoir at Forehill, about 2½ miles from the town. This reservoir, which has a capacity of 2,008,012 gallons, was constructed during the past winter at a cost of nearly £2000. It is 13ft. deep when full, the length and breadth of the bottom being 206ft. and 93ft. respectively, and on the water-line 240ft. long and 126ft. wide. It is made out of the clayey nature of the ground, the face being built with rubble stones. Owing to the wet and stormy weather during the winter, the work of construction was considerably retarded, and the interior was only completed on April 24th last. Since that time the reservoir has been filled to a depth of 9ft. 10in., or an estimated quantity of 1,373,875 gallons. It will not be possible to test to the utmost extent the benefit of the reservoir, seeing that it has not been quite filled, but so far there has been evidence of the sufficiency of the water supply and especially of the utility of the large storage accommodation to meet the great demand for water for household and trade purposes during the day. With the reservoir at the Town House there is now available storage for 2,754,478 gallons, and this, with an average daily supply from the Cairnatto and Wellington sources of 301,160 gallons per day, is calculated to be sufficient for all purposes for many years to come. This is evidenced by the fact that up to the present the reservoir has only been reduced to the extent of a few inches, the loss during the day having been almost fully made up during the night. Had the Forehill reservoir not been in existence and pretty well filled, the likelihood is that the authorities would have been put in a state of alarm, as the great consumption during the day, especially during the present dry weather, has taxed the Grange reservoir to its fullest extent, and each evening lately it has been pretty far reduced. A hearty vote of thanks was accorded to Mr. and Mrs. McGillivray for their hospitality, which Mr. McGillivray suitably acknowledged. The health of Mr. Anderson Pirie, the contractor for the new reservoir, was also pledged, Mr. Pirie responding. The company returned to town in the evening, having enjoyed a capital day's outing.

A MEETING was recently held to consider the advisability of erecting a pier or landing stage at Dawlish. Mr. G. B. Avant (chairman of the

District Council) presided, and said some years since a scheme was adopted and a Provisional Order obtained by the then proprietor of the Albert Hotel, and even some of the iron work was sent off, but the matter went no further. In 1887, the Local Board advertised for plans and estimates for a promenade pier. Five firms responded, and the estimate ranged from £5000 to £14,000, the pier to be erected outside the viaduct and extended about 900 feet seaward. The Board did not then see its way to involve the ratepayers in such an expense. In 1896 Mr. Coombes was called in, and he supplied the plans now before the meeting.

No. 1 scheme was to form a harbour extending in a south-easterly direction from under Lee Mount, to be 20ft. wide, and run 440ft. into the sea, and then 260ft. in another direction, to cost £17,000. No. 2 scheme was for a pier to run 500ft. in length from the new sea wall, to be 15ft. wide, and cost £5000. No. 3 scheme was a pier to be carried out 930ft. near the present breakwater; estimated cost £3700. The diversity of opinion held by members of the Council caused them to lay the matter before the ratepayers. After considerable discussion it was resolved that the District Council be asked to consider No. 3 scheme.

SANITARIANS will watch with much interest the development of the sewerage scheme proposed for the city of Manchester. The scheme, which has received the approval of the City Council, and which will be embodied in a bill to come before Parliament, is on a large scale. It is that the treated effluent of the city sewerage should be carried through a culvert to the estuary of the Mersey. Preliminary estimates as to the expense of schemes of this character are not generally overdrawn, and it is indicative of the magnitude of this scheme that the total expenditure is estimated at a quarter of a million.

THE HISTORY OF THE CHARTERHOUSE.

ONE admires the City Press for the manner in which it is constantly bringing before its readers the institutions and ancient monuments of the City of London. In a recent issue appears an article on the Charterhouse, extracts from which we append:—"In the early part of the sixteenth century the neighbourhood of Smithfield was the centre of that more commendable form of religious zeal which found expression in the establishment of monastic and religious houses. The Greyfriars or Franciscans of Newgate Street, the Priory St. Bartholomew, the Monastery of the Carthusians, and the Priory of the Knights of St. John form a string of celebrated foundations existing at that time. The history of the Charterhouse, as the Carthusian Monastery was commonly called, and the plot of ground upon which it stood is a very curious one, and but few people have any idea of the interesting historical memories bound up in grey stone buildings on the north side of Charterhouse Square, a spot which seems to be so far removed from the every day bustle of the great City in the centre of which it stands, a spot of peaceful repose. In the year of the plague the sanitary regulations were in a very rudimentary state, and with all the burial grounds full to overflowing, the dead bodies were buried in any possible spots. The Bishop of London, horrified at the idea of burial in unconsecrated ground, purchased three acres of land, called in those days "No man's land," and, enclosing it with a wall, placed it at the service of the poor people. In the following year Sir Walter de Manny purchased from the master and brethren of St. Bartholomew the piece of ground called "Spittle Croft," consisting of thirteen acres and a rod, which was situated next to "No man's land," and devoted it for the same purpose. This plot of ground now comprises Charterhouse-square, the site of the present Master's Court, the playground of Merchant Taylors' School, and some land in Goswell Road and Clerkenwell Road, built on within the last twenty-five years. Within this area some 50,000 persons were buried. A few words must be said of Sir Walter de Manny, who, at his own expense, provided this large burial ground. Although not an Englishman by birth, he entered the service of King Edward III. when he visited England in attendance on Philippa, who became Edward's wife. He was a brave, warlike man, and a courtier; and his deeds of valour in the service of King Edward are well known. But, like many a soldier in those days before the existence of peace societies, he considered his profession of arms in no way incompatible with the foundation of a religious house; and, in 1361, in conjunction with Michael de Northburgh, Bishop of London, he commenced to

BUILD A MONASTERY

on the site of the burial ground. Ten years later the monastery of twenty-four Carthusians was founded at the charge of Sir Walter de Manny, who also endowed it. The monastery, which was called "the House of the Salutation of the Mother of God," was a double monastery of the order of the Carthusians, an order founded, in 1084, by St. Bruno at Charteux. The order was a very strict one. No one was allowed to leave the monastery except the Prior and Procurator, and thus cut off from the world, the monks studied, contemplated, and attended to their many religious services in the chapel. The monasteries of Carthusian monks usually consisted of two cloisters, a large and a small one. In the case of the Charterhouse the large cloister occupied roughly the site of the present school playground, the chapel, which was consecrated in 1371, occupying a position in the centre of the south side. The monks' houses were twenty-five in number, and there were also in the great cloister the chapter house and laundry. The prior's abode was at the south-west corner, and close by were the refectory and the buildings contained in the little cloister, which occupied what is now the Master's Court. The great cloister has, of course, entirely disappeared, with the exception of

two doorways to cells, but some portions of the original chapel are still to be seen, whilst the ante-chapel dates back as far as 1509, and is a relic of the monastic occupation. The Gate House was nearly entirely rebuilt at the end of the seventeenth century, but the old gates are believed to be the same as hung there at the close of the monastic period. The Wash-house Court, too, a small quadrangle built partly of brick and partly of stone, the home of the lay brethren, dates back prior to 1537. The monks' cellar beneath the refectory also remains, and last, but not least, there is the large Guesten Hall of the monastery, a building dating back to the early part of the sixteenth century, a time when

EXTENSIVE ALTERATIONS

were made to the monastery. Sir Walter de Manny did not long survive the foundation of the monastery, for he died in London in 1371, and was buried with great solemnity in the chapel of his monastery. A finely-carved stone tomb was erected over his remains. About three years ago, when some repairs were being executed in the south wall of the registrar's house, a beautiful piece of tabernacle work discovered. The Rev. H. V. le Bas, the preacher of the Charterhouse, who has studied the history of the monastery, says: "The Arms in the right hand top corner are those of Sir Walter de Manny, who founded the Carthusian monastery here in 1371, and was buried in the chapel in the same year. It is beyond doubt that the stone formed part of the tomb erected to the memory of Sir Walter and Margaret his wife." The monastery flourished for more than a century and a half, and from time to time generous benefactors added to its endowment, until in 1537 its annual income was stated to be £642 4s. 6d. Although it can be safely assumed from the evidence of contemporary writers that the Charterhouse did not share in the somewhat general demoralisation which King Henry VIII. the excuse for suppressing them, the Charterhouse had, of course, to suffer with the rest; and, after three years' persecution of the Prior and monks, the monastery with its revenues was surrendered to the King on June 10, 1537. We now enter upon the

SECOND WELL-DEFINED PERIOD

in the history of the Charterhouse, when the monastery became a private house, the successive owners of which have left distinct traces in the neighbourhood. The site and buildings were in the first instance granted to Sir Edward North, who built himself a house, afterwards called Rutland House, on a site to the east of the chapel, now partly occupied by the house of the head master of Merchant Taylor's School and the porter's lodge. The great cloister, with its twenty-five small houses, was, of course, quite useless for the purpose of a nobleman's residence, and before long practically disappeared, whilst the large open space in the interior appears to have been converted into a garden. But the little cloister close by, which had been to a great extent rebuilt about 1509, with the fine Guesten hall, kitchens, and other offices, were easily converted to the purposes of a private residence. Sir Edward sold the Charterhouse to the Duke of Northumberland, who was beheaded in 1553, and the site reverted to the Crown, by whom it was again granted to Sir Edward North. In the year of her accession Queen Elizabeth held her court at the Charterhouse for five days, and the contrast between the gaieties of an Elizabethan Court and the solemnity of the monastery of but twenty years before must have been very striking. The Queen again paid Lord North a visit in 1561, when she stayed at the Charterhouse for four days. It will be remembered too, that King James also kept his Court at the Charterhouse on more than one occasion. Under these circumstances it is only natural to conclude that the monastic buildings had been converted into a commodious and comfortable mansion, although a later tenant, the Duke of Norfolk, seems to have made several important additions and alterations. A contemporary writer describes the Charterhouse as a "large

and goodly mansion, beautified with spacious Gardens, Walkes, Orchards, and other pleasures, and very aptly seated for wholesome ayre, and many other commodities." On the death of Lord North, in 1565, his son sold the Charterhouse to Thomas Howard, the fourth Duke of Norfolk, retaining only a small portion as his own residence on the east side of the chapel, now known as Rutland Place. The Duke seems to have taken a great interest in his purchase, and spent money freely on

IMPROVEMENTS.

The large Guesten hall of the monastery, which was converted into the banquetting hall of the mansion, was improved by the addition of the minstrels' gallery, and the gallery at the north end. The great fireplace in the hall, the great staircase, the library, the governors' room, and the arcade over which the terrace runs, were all built subsequent to the occupation of the monks, and most of these improvements may be set down to the Duke, whose initials T. N., with the date 1571, are to be seen in the hall. The unfortunate Duke was, however, implicated in treasonable plots with Mary Queen of Scots, and in 1572 suffered at the block for high treason. On his death the property passed to the Earl of Arundel, and then to the Earl of Suffolk, who entertained King James there in 1603. Eight years later the property was sold to Mr. Thomas Sutton, and the Charterhouse then entered upon its

THIRD AND LAST PHASE.

Mr. Thomas Sutton, the founder of the Charterhouse Hospital and School, was born in 1532 at Knaith, in Lincolnshire, and educated at Eton and St. John's College, Cambridge. His mother came of a good old Yorkshire family, whilst his father was Steward of the Courts to the city of Lincoln. Sutton was sent abroad to travel on the completion of his University career, and on the death of his father he entered the service of the Duke of Norfolk. Subsequently he became steward to the Earl of Warwick, whilst he was also at some time connected with the household of the Earl of Leicester. He was appointed by the Earl of Warwick the Deputy Master-General of the Ordnance, and took up his abode at Berwick. The constant border disturbances gave Sutton the opportunity of showing his "loyalty, valour, and wisdom," and, in 1569, he became Master-General of the Ordnance of the North for life. Various military operations were successfully undertaken during the next few years, and it was at this period that Sutton laid the foundation of his large fortune. It is a curious coincidence that Sir Walter de Manny, the founder of the monastery, was a man of war, and that Thomas Sutton, although he made his fortune in commerce, was also so closely connected with military operations, and was even in command of a battery at the siege of Edinburgh in 1573. Thus the two great institutions at the Charterhouse, which were essentially works of peace, were founded by men who were soldiers by profession. In 1594 Sutton executed a deed of gift for the foundation of what he termed a hospital at Hallingbury-Bouchiers, in Essex. This deed was, however, never carried into effect, although an Act of Parliament authorising its execution was obtained in 1609. What caused Sutton to

ABANDON THE SITE

at Hallingbury-Bouchiers is not known, but in 1611 he purchased the Charterhouse from the Earl of Suffolk, the second son of the Duke of Norfolk, to whose household he had formerly been attached. On June 22nd, 1611, letters patent were issued authorising Sutton to found and endow his Hospital and Free School within the Charterhouse. He had originally intended to preside over the hospital as its first master himself; but age and infirmity were creeping upon him, and he found it necessary to set his worldly affairs in order. In October the Rev. John Hutton was appointed the first master of the hospital, and a month later Sutton executed his will, a lengthy document, contained in twenty-three leaves, which concluded with the following clause: "All the rest of my goods, and chattels, and

debts, not before given and disposed, I give and bequeath to my intended hospital, to be employed on and about the same, according to the discretion of the feoffees of my said hospital, or the greater part of them." On December 12th, Thomas Sutton died at Hackney, at the age of seventy-nine, his body being embalmed and deposited in a vault in Christ Church, Newgate-street, and there it remained until the founder's tomb was completed in 1614, when the body was conveyed to its last resting place.

THE OBJECT OF THE INSTITUTION

founded by Thomas Sutton was twofold. In the first place, provision was to be made for the accommodation of eighty poor brethren, men in the decline of life who were in straitened circumstances. The second object was to provide food, clothing, and education for forty poor boys, who would otherwise lack a good education. But Thomas Sutton's commands were not to be carried out without a struggle, and various legal proceedings were instituted to set aside the will endowing the hospital. A long struggle took place, and in July, 1613, it terminated in favour of the charity. The governors met and proceeded to appoint the eighty pensioners, after declaring "that there should no rogues or common beggars be placed in the hospital, but such poor persons as could bring good testimony of their good behaviour and soundness in religion, and such as had been servants to the King's Majesty, either decrepid or old; captains either at sea or land; soldiers maimed or impotent; decayed merchants; men fallen into decay through shipwreck, casualty of fire, or such evil accident; those that had been captives under the Turks, &c." As already stated, John Hutton had been appointed by Sutton as the first Master of the Charterhouse. This office must not be confused with that of the schoolmaster, who was in charge of the poor scholars. The Master was the head of the whole institution, the other officials being the preacher, the reader, the organist, the schoolmaster, the usher, the registrar, the receiver, the auditor, and the physician. The management was in the hands of sixteen governors, appointed by Sutton, who had the power of filling up vacancies on the governing body. For nearly three hundred years these governors have been selected from the greatest people of the land—princes, nobles, archbishops, bishops, cabinet ministers, and judges. Sutton left no detailed scheme for the internal administration of the hospital, and the regulations under which it was and is governed were slowly evolved by the governors as the result of experience. As years passed by the school flourished and grew. In addition to the scholars on the foundation, other boys were admitted, and in 1872 the governors decided to

MOVE THE SCHOOL

to the country. A site was procured at Godalming, and the vacant site in Charterhouse Square was bought up by the Merchant Taylors' Company, who required more room for their rapidly increasing school, so long situated in Suffolk Lane. As a sanctuary against the powers of a hard and unkind world, the Charterhouse has afforded a refuge to many a victim of the mutability of fortune. Men of science and men of letters, often unrecognised by their generation, have passed their last years in the calm philosophic retirement of the Charterhouse. Among these may be mentioned Mr. Stephen Gray, a Fellow of the Royal Society, who was noted for his electrical experiments at a time when electricity as a force was scarcely recognised. Mr. Maddison Morton, the author of "Box and Cox," and hundreds of other short plays, ended his days as a "poor brother" of the Charterhouse; and quite recently the death was announced of another pensioner, Dr. Dawson, a man of considerable note in the photographic world. The Charterhouse itself has been considerably altered and added to in order to meet modern requirements. The entrance gate is some two hundred years old, but the gates themselves are believed to be the same as those which hung there at the time of the suppression of the monastery. The chapel was built in 1371

for the monks, and was altered by them in 1509. When Sutton's trustees took over the site in 1612, the chapel was again altered. Some portions of the

ORIGINAL WORK

are still left, and the ante-chapel dates from the beginning of the sixteenth century. The Great Hall also dates from about the same period, and the Monks' Refectory still exists. What is now known as the "Old Cloister," a red brick building running up to the present school, was no part of the monastery, and is a relic of the occupation of the Charterhouse by the Duke of Norfolk. The Washhouse Court, a small courtyard, built partly of brick and partly of stone, is one of the oldest portions of the building as it now stands. The chapel contains several interesting monuments. The founder's tomb is situated on the north wall at the east end. It consists of a huge monument, beneath which is a large vault containing, in addition to the body of Thomas Sutton, the remains of John Lawe, his executor; of Hooker, Beaumont, Bennett, and King, four of the earlier Masters of the Charterhouse; and also of Lord Ellenborough, an old Carthusian, who was, at his own request, buried there in 1818. On the south wall, opposite the founder's tomb, are the beautiful monument of Francis Beaumont, the fourth Master, who died in 1624; Chantry's monument of Lord Ellenborough; and Flaxman's memorial of Raine, who was schoolmaster at the beginning of the present century. On the western wall there is also a half effigy of John Lawe, who died 1614, and was buried in Sutton's tomb.

CHANDELIERS OF WROUGHT IRON.

DESIGNS for chandeliers and side brackets in wrought iron are countless, and they are especially commended for gas and electric lights in the hall, dining-room, or library. The beautiful ornamental leaf work that can be so artistically wrought from thin sheet iron is an acceptable embellishment to the oftentimes monotonous scroll work, and its judicious application to the necessary places lends a grace and freedom to many articles of ornament that would otherwise be harsh and unattractive. One of the chief charms of wrought iron chandeliers and brackets is the way the dull black combines with copper and brass, and with the most brilliant hues of deep ruby glass, topaz-coloured globes, blues and green of peacock brightness, and the old world green bottle glass, all gain in intensity from contrast with the ironwork. To keep the dead-finished wrought iron constantly fresh and clean, it is only necessary to rub it with a flannel cloth, on which a little crude oil has been poured. Only the pure crude oil or kerosene should be used, as other oils gum on the surface, and in a short time spoil the original finish. The occasional application of the oiled rag will keep the Berlin black finish in perfect condition. Where it is not possible to get into the small places with the rag, a stiff bristle brush can be lightly dipped in crude oil and worked into all the little nooks and corners. Iron work that must be re-blacked can be sent to the shops where that class of work is done, though sometimes a considerable expense can be saved by doing it at home. To prepare a good and lasting black, mix a little ivory-black paint, ground in oil, with turpentine, to the consistency of cream, and apply it to the iron with a soft brush in two or three successive thin coats. Another good black can be made by adding lamp-black to brass lacquer, and if too thick thinning it with alcohol. This, however, cannot be applied over a surface that has once been oiled, while the turpentine and ivory black may be repeatedly used, and every time it will dry with a dead-black finish.

The Gorton Urban District Council proposes to borrow a sum of £10,850 for a cemetery and £20,196 for works of private street improvement.

GLASGOW MAIN DRAINAGE.

THE City Engineer, Mr. A. B. McDonald, has prepared an elaborate and interesting Memorandum, for the use of the Corporation, giving the history of the sewage system of Glasgow. From that part of the statement dealing with the important projects for completing the treatment of the sewage in such a manner as to secure the purification of the Clyde we take the following:—The Dalmarnock Works have been in successful operation for three years, with results that compare favourably with any that have been obtained in this or any other country. The area to be drained eventually into the Dalmarnock Works is 3465 acres, with a present population of 252,000. It is estimated that ultimately, when all the sewer connections are made, the quantity of sewage passing through the works daily will be 17 million gallons. The unquestionable success of the treatment of the sewage at Dalmarnock removed all the uncertainty regarding chemical methods, which caused the Town Council to hesitate acting on the advice of Mr. Bateman in 1881, and the Corporation resolved, in the autumn of 1895, by a large majority, to proceed with the works necessary for the collection and disposal of the remainder of the sewage of the northern bank of the river, and instructed the preparation of a bill to obtain the requisite authority from Parliament. Great physical changes had meanwhile taken place within and beyond the city since the date of Mr. Bateman's report, so that it was impossible to adhere to the precise lines recommended by him in the third section above quoted as preferred by the Town Council.

THE SCHEME HAD TO BE DEVIATED

to accommodate itself to local circumstances, but as far as possible the main features were preserved. The scheme included in the bill dealt with the sewage of the remaining municipal area not included in the Dalmarnock undertaking on the north bank of the river, with the burgh of Partick, the districts of Temple, Knightswood, Jordanhill, Scotstounhill, and Yoker, with landward parts of the county of Renfrew, and of the county of Dumbarton, and with the burgh of Clydebank. The whole area included is 7575 acres, which may be increased if the different authorities interested are agreed. The probable ultimate population of the area is estimated as 676,600 persons. The leading features of the scheme are the construction of an outfall sewer which will convey the drainage of the higher levels of Glasgow and Partick to Dalmuir, where it will be chemically treated at the works, which are to be constructed there on the lands acquired for that purpose by the Corporation; the construction of an intercepting sewer for collecting the drainage of the lower levels of the city; the construction of an intercepting sewer to collect the drainage of the lower levels of the burgh of Partick, which, by a westward extension to Blawart Hill, may be made the means of draining also that part of the county of Renfrew, extending to 392 acres, which does not gravitate to the outfall sewer; a connecting sewer to deliver the sewage of the Glasgow and Partick intercepting sewers into the outfall sewer from the pumping station at the river Kelvin; an intercepting sewer which will convey to Dalmuir the drainage of the burgh of Clydebank, and which, by an eastward extension to the neighbourhood of Blawart Hill, may be made the means of draining also flat part of the county of Renfrew and of the county of Dumbarton, extending to 1084 acres.

THE TOTAL AREA TO BE DRAINED

by the outfall sewer is 6759 acres, which may be increased by arrangement to 7151 acres; of this latter area, 5521 acres, or 77 per cent. of the whole, will be carried to Dalmuir without pumping. The whole sewage carried by the outfall sewer will be delivered at such a height above tide level as will enable it to be discharged at once into the precipitation tanks. Great importance is attached to this circumstance, which is regarded as a dominant principle of the scheme. The whole length of the outfall sewer is nine miles, two and a quarter

miles being within the city, two miles within the burgh of Partick, two miles in the county of Renfrew, and the remainder in the burgh of Clydebank and county of Dumbarton. The dimensions of the outfall sewer, from its commencement until it reaches the Partick pumping station, vary from the capacity of a circle 3ft. in diameter to that of a circle 7ft. in diameter. The inclination at different parts of its course is 1 in 295, 1 in 793, and 1 in 2640. The area drained is 3706 acres, with an ultimate population estimated at 370,600. The estimated daily flow of sewage, calculating the population at 100 persons per acre, and allowing 50 gallons per inhabitant, is 18½ million gallons. Twenty-one million gallons additional are computed as the amount represented by a rainfall of one-quarter of an inch daily. The combined quantity of 39½ million gallons will pass through the sewer without charging more than two-thirds of its capacity, even assuming that 70 per cent. of the volume of sewage runs through in twelve hours. The connecting sewer will deliver to the outfall the

DRAINAGE OF THE LOWER LEVELS

of the city and of the burgh of Partick, together with 80 acres of Renfrewshire territory, being an area of 1238 acres, with an ultimate population computed at 123,800, estimated at a daily delivery of six and a half million gallons of sewage and seven and a half million gallons of rainfall. To convey this additional quantity of fourteen million gallons, the dimensions of the outfall sewer are increased to the area of a circle 8ft. in diameter. In the course of its westward flow to the outfall at Dalnair, six miles and three-quarters distant, the capacity of the sewer is increased to the area of a circle 9ft. in diameter. The augmented capacity, from 7ft. to 8ft. and 9ft. in diameter, will enable it to receive the sewage and rainfall of the higher levels of Partick, of the area drained by the Whiteinch Burn, the Yokermains Burn, and part of the undeveloped territory of the county of Renfrew. If arrangements are made with the authorities interested, the sewage of the residential district of Bearsden, and of intervening landward parts of the county of Dumbarton, may also be included. The inclination of the outfall sewer between the connecting sewer and the Dalnair Sewage Works will be 1 in 2062 for a distance of five and a half miles, and 1 in 2810 for the remaining distance of one and a quarter miles. The mean velocity of the flow will be three miles per hour, so that the whole volume of sewage will pass from the Partick Pumping Station to Dalnair in two hours and a quarter. There will thus be no possibility of the generation of noxious gases, or the emanation of offensive or injurious odours. The Parliamentary estimate was £600,000, made up of £450,000 for sewers and sewer connections, sewage works, works on the river bank at Dalnair, pumping stations at Partick and Clydebank, and an allowance for contingencies. £150,000 was provided for land and wayleaves. It being deemed expedient to conjoin this undertaking with the Dalnair Sewage Works, the borrowing powers were fixed at £700,000 to incorporate the existing debt. When the Sewage Bill was in Committee, an assurance was given that the

DRAINAGE OF THE SOUTHERN DISTRICTS

of the city would be considered within a short period, and that diligence would be exercised in the preparation of a scheme for submission to Parliament. In implement of that undertaking a Special Committee of the Corporation has had the matter under consideration, and, after discussing various proposals, has agreed on a plan whereby the municipal area on the south bank of the river, as well as certain of the territories occupied by other local authorities, may be completely drained by two systems of main sewers adapted to the separate levels of the low-lying areas adjoining the river and the higher lands situated further south. The proportion of drainage which may be conveyed westward to the works without pumping is nearly equal to that which, derived from lower levels, will require to be

pumped. The leading features of this scheme are now sufficiently elaborated to enable the Corporation to enter on negotiations with the local authorities whose co-operation it is desirable to ensure, and it is intended to meet with some of them on an early day. The prosperous issue of these conferences opens up the vista in a not distant future of a complete solution of the great problem that has engrossed the public mind and baffled the ambition of municipal leaders for nearly half a century.

GLASGOW NEW ART GALLERIES.

THE story of the origin of the Glasgow Art Galleries and Museum, Kelvingrove, is an interesting one. The building, which will be the finest of its kind in Scotland, was the outcome of the Glasgow International Exhibition of 1888. The promoters of that Exhibition had in view the application of any surplus to the foundation of a permanent Art collection and museum, and as there was a very handsome amount left after the expenses of the Exhibition had been defrayed, the most sanguine anticipations were realised. It was decided to erect a suitable picture gallery and museum; to provide a hall for musical performances, and to make provision for a school of Art. An open competition for designs resulted in the selection of six plans and elevations, and from these the executive, under the advice of Mr. Waterhouse, R.A., finally decided upon the design shown by Messrs. J. W. Simpson and Milner Allen. The estimated cost was £155,000. The work was begun in 1893, and has been in progress since that time. Various modifications in the plans had increased the probable cost to £200,000, and the administration of the whole affair was finally taken over by the Town Council. The main front of the building faces the north, and looks towards the University at Gilmohill. The block of buildings is 400ft. in length by 200ft. deep, and occupies an area of about 9000 square yards.

THE FRONTAGE

extends east and west, and the principal apartment is the Grand Hall, which runs north and south, and measures 125ft. by 58ft., with a lofty, coved roof. The exterior roof of this hall is shown between the two towers, which rise to 150ft., and face Kelvingrove Park. The access to the main entrance is provided by a spacious double staircase, leading to a splendid porch surmounted by a tower. The principal carriage entrance is on the south side of the building, and handsome vestibules are placed within the structure at both entrances. In the plan of the building the Grand Hall has been made the central point, and from it are the East Court and West Court, at right angles to the hall, each being 105ft. by 64ft. These courts are surrounded by suites of picture galleries and museum galleries, and these are so arranged that one part of the building may be used quite independently of the other, having separate entrances and exits. The exterior is faced with stonework, but the interior is built of brick, and the whole structure is fireproof. The interior walls of the museum galleries are plastered, without decoration, while the picture galleries are lined with wood for convenience in fixing pictures. The floors are chiefly of granolithic pavement. The two main galleries in the wings measure 94ft. 6in. by 37ft., and the four galleries on the north and south sides of the two courts measure 93ft. by 38ft. The four pavilions at the corners of the building are each 35ft. square, and are intended principally for water colours. An ingenious arrangement is used here for lighting the walls. The centre of the roof has a ceiling, but there are marginal ceiling lights whereby the light is thrown directly on the pictures, without any cross reflection. In addition to the pavilions there are four cabinet galleries 14ft. square. There will be altogether six large galleries specially designed for the exhibition of pictures, besides the four pavilions and four cabinets. The general style of the architecture is Jacobean, the details being a free adaptation of Renaissance decoration.

DOUGLAS TOWN HALL.

IT will be remembered in the recent competition, open to all architects, the design of Mr. Arthur Ardron, of Westminster, was accepted, and tenders obtained. The tender of Messrs. Gradwell, contractors, of Barrow-in-Furness, at £10,368, has been accepted, and it may be interesting to give a few particulars of the general arrangement of the new buildings. Three distinct groups are provided, namely—municipal buildings, free library, and fire station. The first-named is placed at the corner of Ridgeway Street and John Street, and the free library occupies the remainder of the Ridgeway Street frontage, and has also a frontage to Church Street. The fire station is placed at the corner of John Street and Church Street. The principal entrance to the public office is from John Street, through a vestibule panelled in stone, with arched ribbed stone ceiling. The Town Clerk's department is placed next Ridgeway Street, and the Borough Surveyor's next John Street; the principal staircase, of Portland stone with wrought-iron balustrading, together with lavatories for the staff, are arranged centrally for each department. On the first floor is the Council Chamber, approached from the main corridor, with three large committee rooms and waiting rooms, as well as spacious lavatory and cloak room accommodation for Councillors. The Council Chamber, which is divided into three bays by pilasters, has a panelled wood dado, and has an elliptical arched ceiling, ribbed and architecturally treated in ornamental plaster work. At one end is a small gallery for the use of the general public, approached by a separate entrance and staircase from Church Street. On the second floor, over the committee rooms, are the caretaker's quarters, also with its own entrance from Church Street. In the basement are provided heating chambers, strong rooms, coal stores, &c. The Free Library will be entered from Ridgeway Street, and has the news room and lending department on the ground floor—the former top-lighted in addition to windows facing South Street. A lavatory for staff is also provided on this floor. The reference room is on the first floor, over the lending library, with librarian's private room, &c. Galleries are provided in the lending and reference rooms for the storage of books, while further storage room is provided in the basement, with lift communication. The Fire Station contains engine room, opening into Church Street, with folding doors, with a large assembly room above. A hose room, with tower for drying purposes, is also provided. The design of the building is Italian Renaissance, somewhat freely treated, and, while simple and dignified in effect, it is characteristic and suitable for municipal purposes. The walls facing Ridgeway Street and John Street will be built in local stone, with Monk's Park Bath stone dressings; while the elevation next Church Street will be carried out in brick. The whole of the roof will be covered with Broseley tiles. The building throughout will be heated on the low-pressure system by means of ventilating radiators and heating pipes, the Free Library having a separate service from the public offices. The floors have been constructed on fireproof principles, and an efficient service of hydrants has also been provided. The buildings will be commenced at once, and it is intended to have them completed in eighteen months from the present time.

An oil painting, representing a Biblical subject, fully believed to be a genuine Murillo, and thought to have been stolen from a convent at San Sebastian, has been discovered in Copenhagen. Its value is estimated to be £25,000.

The fine old parish church of Pentridge, Dorset, which stands on the site of the original edifice, dating back to 775, has just been re-opened after restoration. The restoration is of an effective character. The patronage of this ancient church was formerly vested in one of the great religious houses, Glastonbury or Tewkesbury, but has now fallen into the hands of the Crown.

Professional Items.

ABERDEEN.—The Plans Committee of the Town Council has passed the following plans of new buildings in the city:—Three dwelling-houses on the south side of Urquhart Road, for Mr. James King, builder, per Mr. William Smith, architect; dwelling-house on the east side of Holburn Street, for Mr. James Watson, tailor, per Mr. R. C. Garden, architect; two dwelling-houses on the south side of Great Northern Road, for Mr. G. Godsmen, Orchard Street, per Mr. William Ruxton, architect; wood-waste factory at Stells Road, for John Fleming and Co., Limited, per Mr. Alexander Mavor, architect; three dwelling-houses on the north side of Mid Stocket Road, for Mr. Arthur C. Bruce, architect, per Messrs William Henderson and Son, architects; two shops on the west side of King Street, for Mr. James Milne, cycle manufacturer, per Mr. John Gordon, Catherine Street; dwelling-house on the south side of Great Northern Road, for Mr. James Allan, Torry, per Mr. James Brown, builder (amended plan); alterations at No. 343 Union Street, for the City Property Association of Aberdeen, Limited, per Mr. R. G. Wilson, architect; four dwelling-houses on the south-west side of Hammerfield Avenue, for Mr. William Murray, builder.

BRADFORD.—For a long time past the stone and building trades of Bradford have made the New Inn, Tyrel Street, their rendezvous for various business purposes. The day on which most transactions have been effected has been Thursday, and this has been the place and date of what may be called the weekly Bradford Building Exchange. During the last month or two the leading members of the two trades have decided upon a somewhat important new venture. The upper two stories of the building opposite the New Inn, occupied principally by Mr. Cheetham, coach-builder, have been taken for the purpose of a new Stone and Building Exchange. Desks will be provided for the firms paying regular monthly accounts, and the premises will be generally adapted for the conduct of ordinary business.

A proposal will be made in the Bradford City Council that an Art Gallery and Museum should be erected on Corporation land adjoining Rawson Square. Rawson Place Meat Market is to be extended, principally for the purpose of providing premises for refrigerating operations. The bill gives the Corporation power to compulsorily purchase such shops in Rawson Place on the market side which do not belong to them, while Mr. M. O'Flynn has for some weeks turned his attention as a builder to the question of Bradford having an Art Gallery at reasonable cost. He has now a plan which has been prepared in detail by a well-known architect, and which provides for the utilisation of the Rawson Place site—already practically in the possession of the Corporation. Mr. O'Flynn's plan includes a handsome tower entrance from Rawson Square, and gives to the Art Gallery an area of 15,300 superficial feet, which would be considerably larger than the area of the Birmingham Art Gallery premises, and about three times the area of the Art Gallery premises in Darley Street. Mr. O'Flynn claims that by his project the Bradford Corporation could have a handsome Art Gallery, well lighted, on a site of its own, and in a very central position, for about £10,000.

BIRDFORTH.—Birdforth Church, which dates back to the fifteenth century, and was originally built as a wayside chapel, situated about five miles to the south of Thirsk, has been restored. The original building was of brick, surrounded at the western end by a turret, on which was placed an old wooden structure similar to the one which graced the old church at Scawton, on the Hambleton Plain. The old building has been re-roofed with French tiles, and the old pigeon-cote turret has been rebuilt with clamp bricks. The interior has been refloored and resealed, and the windows throughout reglazed.

CARDIFF.—The Corporation has commenced the construction of underground lavatories on the London style on the triangular piece of ground south of the public library in the Hayes. It is intended to construct others in various parts of the town, but the sites have not yet been selected.

DEWSBURY.—Colonel W. R. Slacke, inspector of the Local Government Board, heard evidence at the Dewsbury Town Hall, last week, with respect to an application made by the Corporation for permission to borrow the following sums:—£10,500 for laying out Crow Nest Park; £3141 for street improvements; and £260 for a steam roller. The schemes were opposed, chiefly on the ground that the outlay was not required.

DUMFRIES.—A new Academy was opened on Friday, Sept. 3rd, by Sir Robert Reid, M.P. The building consists of a massive portico, surmounted by a stone dome, supported at the angles by winged lions and crowned by a figure emblematical of Learning. A course of ornamental panels is carried along under the first-floor windows representing Commerce, Architecture, Plenty, Art, Science, Astronomy, and Justice. The contractors were:—Mason work, Messrs. Houston and Robinson; joiner work, Mr. Samuel McLauchlan; plumber work, Messrs. P. Drummond and Son; painter work, Messrs. W. Haming and Son; plaster work, Mr. Richard Moffat, all of Dumfries; and slater work, Mr. Robert Milligan, Dalbeattie. The carving, which is a feature of the building, was executed by Mr. James H. Douglas, Carlisle. The building will cost about £15,000, the architect being Mr. F. J. C. Carruthers, Dumfries.

DUNDEE.—An important discovery of antiquarian relics has just been made in the neighbourhood of Dundee. A number of workmen engaged upon the property of Mr. David S. Cowans, West Mains of Auchterhouse, came upon a stone cist at a short distance beneath the surface. Further investigations resulted in the discovery of a second stone cist. Both coffins were in excellent condition, and contained burned ashes, while in one of them was found a fine specimen of a bronze dagger about 6in. in length.

EDGECASTON.—The foundation-stone of the new Church of St. Ambrose, Pershore Road, has just been laid. The site, at the corner of Pershore and Raglan Roads, has been given by Lord Calthorpe, and upon this is to be erected a building which will cost between £6000 and £7000. The designs, prepared by Mr. J. A. Chatwin, architect, show a church of red brick, with terra-cotta dressings upon the outside, and Bath stone dressings in the interior. The building will consist of a nave 90ft. long, with a chancel 36ft. long; north and south aisles, shallow north and south transepts, a choir vestry, with organ chamber over, clergy vestry, and an apsidal projection at the west end forming a baptistry. There is also to be a tower and spire at the north-west corner, and a south porch; but only a portion of the tower will be erected in the first instance. The spire, when completed, is also intended to be of terra-cotta, and will rise to a height of about 150ft. The architectural style is Gothic, with flamboyant tracery to the windows. The floor of the church under the seats will be of wood, while the passages will be paved with Ruabon quarries. The church will accommodate 708 adults. The walls will be faced with bricks from the Coalville Brick Company, Leicestershire, and the terra-cotta will be made by Messrs. King and Son, of Cradley. Messrs. Collins and Godfrey, of Tewkesbury, are the builders.

HANLEY.—A large brick oven some 60ft. high, at the manufactory of Messrs. Thomas Fenton and Sons, at Hanley, fell the other day, carrying with it the roofs of the adjoining warehouses. The accident is attributed to mining operations.

LIVERPOOL.—Three shields of stone have been let into the front of the building in Sir

Thomas Street, which is henceforward to be the home of the administrative department of the School Board of Liverpool. On one of these is carved the name of Bushell, on another that of Rathbone, and on the third that of Lester. This lasting form of tribute to three earnest educationists is a happy inspiration of the architect.

A gang of men in the employ of Messrs. Dick, Kerr, and Company, contractors, Leadenhall Street, London, whilst working in Canning Place, on Wednesday, laying down wires for the National Telephone Company, came upon some massive stonework 6ft. below the surface. This, there is every reason to suppose, was part of the wall of the old dock, on the site of which the Custom House now stands. The dock was constructed in 1700, and pulled up in 1826. Not having sufficient power to raise the masonry, the foreman was compelled to break it up, as it was obstructing the excavations. Each stone was found to be 7ft. long and 4ft. in width, and weighs about 5 tons.

LONDON, W.C.—A statement with regard to the proposed restoration of St. Clement Danes was made at a recent meeting of the parishioners. The Rector said that he was glad to have to announce that their historic church would soon be in the hands of the restorer, as a result of the Jubilee. The stands erected around the church in June realised £5750. Legally he was entitled to the whole of the money, but he decided to give it for the purposes of the complete restoration of both the exterior and interior of the church. The scheme of restoration and improvement would include the repairing and redecoration of the interior, introducing an electric light installation, repairing and restoring the organ, restoring the altar (which, though now covered with stained wood, had been found to be composed of costly carved marble), and the restoration of a chest in which the deeds of the church were deposited hundreds of years ago. These were only a few of the details of the scheme, but they were sufficient to show that, without interfering with its antiquity or historic interest—for many notable persons had worshipped within its walls—the church would be fully restored.

NEW HALL.—The interior of the large chapel at the Convent has just undergone renovation. The decoration has been carried out by Messrs. W. Bishop and Co., of Duke Street, Grosvenor Square. The chapel was a banqueting hall at the time of its erection in the reign of Henry VIII. The style of the carving on the three centre pieces set in the ceiling really belongs to the Georgian period, dating from a previous renovation, and the present embellishments have been carried out to harmonise, but most of the other existing decoration has been carried out since the occupation of the building by the nuns, some hundred years ago. An old panel representing the royal coat-of-arms, which has been re-done with the nicest finish, presents a very fine example of carving of the Henry VIII. period. Four entirely new panels have been put in by Messrs. Bishop and Co., and contain designs from the Immaculate Conception after Murillo. The panellings are richly gilt and ornamented with hand-painted work. The cornice is kept to golden tints, with a very ornamental frieze on a gold background, relieved with vermilion. The frieze is all hand-painted work, as also the ceiling. The walls below the cornice both in the choir and the chapel are vermilion.

OWLERTON.—During the past two months Owlerton Parish Church has been closed, and during that time various alterations and additions have been made, which have materially improved the building. A handsome new pulpit has been erected. It is composed of Normanton stone and alabaster, with marble pillars. In addition, the interior of the edifice has been decorated, and the choir stalls have been enlarged. New heating apparatus has been placed in the chancel. The total cost of the improvements has been £300. Messrs. Johnson and Appleyards have carried out the

work of re-decoration, whilst Mr. Franklin, of Langsett Road, has done the work of enlarging the choir stalls, and the heating apparatus has been supplied by Mr. Wright, of Attercliffe.

PAISLEY.—Provost Mackenzie has fixed on a piece of ground on the Greenlaw estate to the west of Mansion House Road as a site for the new Eye Infirmary which he intends to build and give to the town. Sufficient ground is provided for future extensions when necessary. Mr. Charles Davidson, architect, has the plans in preparation, and the work is being pushed forward as quickly as possible.

RAMSGATE.—The proposed Wesleyan Chapel is now well in course of erection. It is designed in the Early Gothic style, and will consist of a nave, with chancel, organ chamber and two vestries. The front will have an outside porch, and over it a mullioned window with cusped tracery, and single light windows on each side of the porch. These are flanked with octagonal buttresses at the corners, which are run up and finish with pinnacles having carved finials. All the other windows have pointed heads, and the glazing throughout will be in cathedral tinted glass with lead quarries and margins. The roof is partially open with arched ribs and pitch pine ceiling. The pulpit and pews are also of pitch pine. The chapel is 50ft. long by 31ft. 6in. wide inside, and will seat 335 persons. The contract is in the hands of Mr. W. W. Martin, and the cost of the work is £1450. The architect is Mr. John Wills, of Derby.

SCARBOROUGH.—The sub-committee in charge of the marine drive operations round the Castle Hill at Scarborough has taken up the question as to approaches to the drive from the Foreshore Road. Notices are to be prepared giving the Corporation possession of the property on Sandside, which will be required to be pulled down or altered in order to allow of the construction of the approach, and the engineer has been ordered to prepare the necessary plans.

SHIELDMUIR.—The foundation-stone of the chancel arch column of the new Roman Catholic church at Shieldmuir, near Wishaw, was laid within the past few days. The church is designed in the Early Decorated style, and will consist of chancel, nave, side chapels, aisles, baptistry, sacristies, confessionals, &c. Red sandstone is being used in the construction, and the estimated cost is £6250, the designs being by Messrs. Pugin and Pugin, London.

SOUTH HACKNEY.—The new synagogue in Mare Street, South Hackney, was opened on the 19th inst. The buildings comprise, on the lower ground floor, a spacious hall convertible into nine class-rooms. The ground floor contains the main body of the synagogue, and the first floor is devoted to the ladies' galleries. The external design is carried out in red brick and artificial stone. The interior is painted in pure white, the woodwork being in imitation of old oak. The cost of the freehold site and of erecting the building, which was built from the designs of Mr. Delissa Joseph, amounted to about £8000.

YARMOUTH.—The foundation stone of the new church for St. Paul's district was laid a few days ago. The old wooden building is nearly pulled down, only a portion having been left standing to be utilised until the new church is fully completed. Messrs. Bottle and Olley are the architects, and Mr. W. Cork the builder. The nave will be 60ft. by 30ft., and the church, which will be of a gothic character, will be half timber with brick face.

The reconstructed North Bridge of Edinburgh has been opened by Lord Provost McDonald. The work has occupied two years, and, at a cost of £90,000, the old stone bridge has been replaced by a magnificent steel viaduct.

FEDERATION OF YORKSHIRE BUILDERS.

THE employers in the Yorkshire building trade are generally supporting the Federation which was formed just over a month ago, and the founders are sanguine that the organisation will be greatly developed in a very short time. Already many important associations have joined, and others are expected to follow the example set. It is anticipated that the new combination will strengthen the position of building trade employers throughout the country in many ways. With the object of further making known the objects of the Federation, a meeting was held on Friday last at the Royal Exchange, Leeds. Alderman Jessop (president) was in the chair. At the outset of the proceedings the Chairman explained the objects of the Federation, and afterwards an Executive Committee of fifteen was appointed to carry them out. An address was given by the Secretary of the Free Labour Association (Mr. Frederick Miller), and a resolution was adopted sympathising with the work which that agency has in view. The objects of the Building Employers' Federation are thus set out in the rules:—"To secure full discussion of, and, where practicable, the adoption of a common policy in regard to questions that may from time to time be raised affecting the trade; to defend the interests of its members against combinations of workmen seeking by strikes or other methods to impose restrictive conditions on the trade; to secure united action and provide mutual support in dealing with any attempt such combinations may make to impose unfair terms on individual employers or districts; to establish branches of the Association in towns and districts where they do not already exist; to generally guard the interests of the trade, and obtain fair and equitable treatment from architects in relation to quantities and conditions of contract; and to raise and maintain a common fund, to be applied and used in carrying out the objects in view." The rules further set forth: "The principles of the Federation being conciliatory to the operatives, it shall in all cases of dispute with them do its utmost, by arbitration or otherwise, to avoid strikes or lock-outs; but if the operatives refuse any equitable settlement of a dispute affecting any member of this Association, the matter shall be brought before the Executive Committee, and, if it decides that the member interested shall be supported, then each branch and every member thereof shall do their utmost to help to bring the dispute to a successful issue, and shall loyally adhere to such rules as may from time to time be passed with that purpose."

SOCIETY MEETINGS.

Essex Archaeological Society.—The members of the Essex Archaeological Society had a field day on Tuesday, the 17th inst. The first place visited was Elsenham Parish Church, the chancel of which is now undergoing repairs. A brief account of the history of the church and of its chief characteristics was given by Mr. G. Pritchard. From here the party drove on to Thaxted, stopping *en route* at Horham Hall, a famous Essex mansion, having a picturesque situation, and possessing many points of interest. It was here that Queen Elizabeth stayed for some time before she came to the throne, and she paid it a second visit after her accession. From here a move was made to Thaxted. Its parish church, which makes a good landmark for many miles around, is one of the finest and largest in the county.

Institute of Certified Carpenters.—The members of the Institute of Certified Carpenters visited St. Paul's on Saturday to inspect its architect's famous dome and roof. Mr. T. M. G. Lloyd, hon. sec., conducted the visitors, explaining at certain stages the principles involved in the construction. Comparisons were made between the fine proportions of Wren's work and those of the dome of St. Peter's at Rome and that of the Florence

Duomo, showing the English architect's rare scientific skill as well as his artistic insight. Visitors were enabled to follow the guide's elucidation in both the Stone gallery below and the Golden gallery above the vast graceful cupola. The location of the visitors in the last-named gallery gave them a fairly adequate notion of the magnificent panoramic view that can be obtained of London when the air is clear. Upwards of thirty of Wren's churches can be discerned in an eastward direction, the most striking being Bow Church, Cheapside, and St. Michael's, Cornhill. A visit was afterwards made to the crypt.

Enquiry Department.

THORNDON HALL, ESSEX.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you inform me who was the Architect of Thorndon Hall, Essex, a "Georgian" mansion, the seat of Lord Petre; and if there is any work containing plans of same? I believe there is a volume on houses of this description, but am ignorant of its title or author.—Yours faithfully, S. S.

Mr. John Belcher's forthcoming work on "Later Renaissance Architecture" will, we understand, contain a full description, together with plans of Thorndon Hall. Or, in the meantime, the plans may be seen in Gwilt's "Encyclopædia of Architecture," and particulars can very probably be unearthed at the South Kensington Museum Library.—Ed.

Correspondence.

OLD BUILDINGS IN DEVONSHIRE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With much interest I read the article under the above heading in your journal of the 25th ult.

Many besides myself will no doubt have done so, and will equally with me deplore the "down with it" tendency that seems to be so general, even in old world districts so full of beauty in landscape and historic interest as those named in the above interesting article. For example, it is deplorable to think of the probable unnecessary destruction of such an interesting tower, all that remains of the St. Leonard's Chapel-of-Ease to the Parish Church of Wolborough in the days gone past, which stands in a unique position in the town of Newton Abbot, with four streets converging upon it, and containing as stated a musical peal of bells, and to this day, I believe, there continues the custom of ringing at night the "curfew" (surely those instances have already become few enough).

There would seem to be no adequate reason for destroying this old relic of a departed age in this pretty old market-town in Devonshire, nestling in a lovely valley between the hills of Wolborough and Highweek.

Much as all archaeologists would deplore its disappearance, in like measure would they be gratified to learn that upon reconsideration on the part of the authorities in the neighbourhood such a loss to antiquity might be averted. Yours faithfully,

"ST. LEONARD'S TOWER AND BELLS."
September 6th, 1897.

By order of the prison authorities, workmen are now engaged in removing the old gateway, formerly the principal entrance to the Kent county prison at Maidstone. Adjacent to this gateway was the cell in which prisoners condemned to death were incarcerated, and through the smaller opening they used to emerge and stand on the scaffold in view of the public assembled in the open square in front. The prison wall has been rebuilt on the inner side of the gateway, which would therefore be not only useless, but unsightly.

Trade and Craft.

JEDBURGH OLD BRIDGE.

A portion of one of the piers of the Old Bridge over the Jed at Canongate foot has been taken down in consequence of its having been in a dangerous state, and is being rebuilt. This bridge, which is believed to belong to the twelfth century, is said to have been built to afford the means of transit for the stones used in the erection of the abbey. The bridge is a strongly-built structure, with three ribbed arches, but for many years it has been used only for foot passengers.

LEEDS AND LIVERPOOL CANAL.

The report of the directors of the Leeds and Liverpool Canal Company for the first half of the present year states that the disbursements on capital account amount to £32,189, viz.: For land, works, and general improvements, £9725; working stock (boats, engines, horses, &c.), £3157; reconstruction of canal, £19,307. The amount expended on land and works includes an advantageous purchase of land opposite the entrance to the Liverpool docks, where space is urgently required for widening the canal; £1000 towards the new warehouse at Bradford, and various smaller items. The amount spent on the improvement of the canal has been about the same as in the second half of 1896, and includes very heavy work in Liverpool and Bootle, as well as the continued dredging and reconstruction of the banks near Wigan and in other portions of the canal.

A SINGULAR ROAD DISPUTE.

A rather extraordinary state of things has arisen at Round Oak, Staffordshire, owing to the refusal of the Great Western Railway Company to allow the passage over one of its bridges of a casting about 43 tons in weight, borne on a carriage which increases the load by about five tons. The casting comes from the dismantled works of the New British Iron Company, and was on its way by a somewhat circuitous route to the Old Level Ironworks. When the former works were sold under the hammer, the original purchaser of the casting sacrificed his purchase owing to the great difficulty of transporting such an enormous weight, and it was subsequently bought by the present owner for the purpose of being used at the Level Works. All went well with the transport of the casting till about a month ago, when it neared the railway bridge in question. The railway officials peremptorily declined to let it pass owing to the risk to the bridge that might be incurred, and they contended that it could not be said to come under the definition of the ordinary traffic of the district for which alone they have to provide bridges of sufficient strength. The contractors for the removal, however, hold that in an iron-making district it is the duty of the railway company to provide for the passage of weights as heavy as that referred to, though they may only rarely pass along the highway. The propping of the bridge while the casting passes would, it is understood, lead to some interruption of traffic. There was an idea among the railway officials that one night an attempt would be made to risk the passage of the bridge, and, to the surprise of the public, a trench was found cut across the road, but this was subsequently levelled again. Meanwhile the casting has to be specially guarded in order to avoid accidents. While the railway company refuses to let the casting pass over the bridge, the local authorities threaten proceedings for obstruction of the road. The deadlock has existed now for a month, and the subject is arousing much interest in the neighbourhood.

A NEW STEEL PROCESS.

It is well known that many of the failures of cast steel apparatus, often involving heavy loss of life, are due to what are called "flaws." Their detection in many cases is practically impossible. It therefore becomes a matter of

very great moment to devise some plan by which the occlusion of air can be absolutely prevented, and a new invention, patented by Mr. William Ellis-May, promises to do something towards this. In the Ellis-May process the castings are made in an air-tight chamber, from which the air is exhausted, the mould or casting being placed in the chamber before the exhaustion of the air. A series of other chambers surrounds this chamber, each connected with it by a pipe controlled by valves. In these chambers a reserve of vacuum is stored, the air from them being exhausted by powerful vacuum pumps. When a casting is ready to be run in, the controlling valves are opened, and the residue of air in the casting chamber is instantaneously sucked out into the surrounding chambers at the same moment that the molten steel is poured into the mould. The casting thus takes place *in vacuo*; the secluded air and gases rush out of the fluid metal and diffuse themselves in the vacuum chambers, and a flawless, homogeneous steel casting is the result. It is not too much to say that if the Ellis-May casting process proves a success on a commercial scale, it will tend to effect a revolution in the industry.

THE CENTRAL LONDON RAILWAY.

The first junction of the tunnels between Holland Park and Notting Hill Gate stations was successfully made on Saturday night last. The following junctions will be made before the end of the current year, viz., Shepherd's Bush station and Woodhouse Park (the generating station), Shepherd's Bush and Holland Park stations, and Queen's Road and Westbourne stations, and in February, 1898, the last junction of No. 1, 2, and 3 contracts will be made between Notting Hill Gate and Queen's Road stations.

A NEW IRISH RAILWAY.

An important railway project is about to be undertaken at Cork on behalf of the Cork Blackrock and Passage Railway Company. A Scottish contractor, Mr. Best, of Edinburgh, has been entrusted by the directors of the Company with the work of constructing a line of railway from Passage West to Crosshaven, a small seaside resort near the mouth of Cork Harbour. The distance of the proposed line is about twelve miles, and Mr. Best's tender at £82,000 has been accepted for the carrying out of the work, which will be begun forthwith.

LANDLORDS AND SANITARY INSPECTORS.

In the City of London Court last week, before Mr. Commissioner Kerr, Mr. Robert E. Clarke, builder, 16, Finsbury Pavement, E.C., sought to recover the sum of £10 2s. against the defendant, Mr. Frederick London, 170, Edmund Street, Birmingham, for work done at 85, Finsbury Pavement, of which the defendant was the landlord.—Mr. Harry Dade, for the plaintiff, explained that the defendant's London property was managed by Tillett and Yeoman, a firm of estate agents. The house in question had been empty, and it succeeded in letting it. The tenant wanted certain repairs done, which the plaintiff estimated would cost £85. The order was given him; and, indeed, the £85 had been paid by the defendant, as the landlord. But while the work was in progress the City of London sanitary inspector visited the house. That official ordered the plaintiff to do extra work, for which he now asked defendant to pay.—Mr. Aldous, for the defendant, urged that no liability could attach to the defendant for the extra work which he had never ordered to be done. What business had a builder to do work which the landlord had not instructed him to do?—Mr. Commissioner Kerr replied that if a sanitary inspector required work done a builder was bound to do it. Under the Sanitary Acts a landlord was liable for such work, although he did not give any order.—Mr. Aldous argued that the defendant, as the landlord of the property, should have been communicated with.—Mr. Commissioner Kerr said that if that had been done, and the defendant had not given the order, the sanitary inspector

would have taken him before a magistrate, who would have made an order. It was no use opposing sanitary inspectors when they wanted necessary work done. It was for the public benefit. There must be judgment for the plaintiff for the amount claimed, with costs.

At Kelloe parish church, in the county of Durham, a marble tablet has just been unveiled to the memory of Elizabeth Barrett Browning.

The facsimile of the old beacon which used to be regarded as a historic feature of the Beacon Hill summit, Halifax, has just been re-erected. The erection subsequently collapsed owing to the pole not being sufficiently substantial.

RAWCLIFFE HALL, the residence of Mr. Ralph Creyke, D.L., ex-High Sheriff of Yorkshire, has been partially destroyed by fire. The fire originated in the west end of the mansion—the more ancient half of the house, dating from the seventeenth century. Most of the contents of the lower rooms, including valuable Florentine furniture, priceless curios, and pictures by some of the most celebrated painters, were saved.

MR. HAMO THORNYCROFT's statue of Oliver Cromwell, destined to be set up at Westminster, is very nearly completed. It is characteristic and expressive, and represents the Protector standing with one hand upon the sword at his side, holding a Bible in the other. His head is bare, and his felt hat—which, of course, is of the shape affected by the Puritans of his time—is under his arm, while, as if lost in thought, he looks moodily down at the ground at his feet. The likeness of the face, derived largely from the death-mask, is strikingly faithful.

KEYSTONES.

At Montreux, on the Lake of Geneva, a number of workmen have been killed by the collapse of a large building, intended for a lunatic asylum, which was in course of construction. Sixty men were at work at the time.

A SERIOUS fire recently occurred at Messrs. Trechmann and Co.'s cement works at Haling, near Rochester, resulting in the total destruction of the mill-house and machinery, together with many tons of cement. The damage is estimated at £6000.

A PORTION of Lord Carlisle's Manor Park estate at Hampton-on-Thames will shortly be offered for sale in lots suitable for the erection of superior villa residences. Another interesting estate that is to be put up to auction during next month is Hafod-y-Bryn, the seat of Mr. Samuel Pope, Q.C., in North Wales.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ANDENSHAW.—For rebuilding Liberal Club. Mr. J. H. Burton, architect, 2, Guide-lane, Hooley Hill:—
Wellerman Bros. £1,160 14 J. Ridyard £1,013 0
J. Whitehead 1,074 0 Exrs. of T. Storer 1,005 0
E. Kirkley 1,071 7 Z. Pike, Hooley
C. Evans 1,041 0 Hill (accepted) 990 0

BAKEWELL.—Accepted for the construction of precipitation tanks and about 1½ miles of stoneware pipe sewers, Stony Middleton, for the Rural District Council. Messrs. Sterling and Swann, engineers, Town Hall, Chapel-en-le Frith, via Stockport:—

T. A. Matthews, Buxton £1,257
BARNET (Herts).—For additions to the Victoria Cottage Hospital, for the Committee. Mr. C. P. Ayres, architect, 14A, High-street, Watford:—
W. James £1,984 0 M. Pearson £1,593 17
J. W. Pavey 1,859 0 J. Daniels 1,518 0
C. H. Hunt 1,663 0 W. Wade, St. Neots* 1,368 0
H. M. Dove 1,650 0 G. and J. Waterman 1,227 0
Turner, Ltd 1,597 0 W. B. Neal 1,150 0

CONTRACTS OPEN.

COUNTY OF HERTFORD.
TO BUILDERS.
NEW POLICE STATION, HARPENDEN.
The Standing Joint Committee of Quarter Sessions and the County Council are willing to receive TENDERS for the above WORKS.

Builders desirous of contracting for the Works may see drawings, specifications, agreement, &c., at the County Surveyor's Office, 41, Parliament-street, Westminster, S.W., between the hours of ELEVEN a.m. and FIVE p.m.

A copy of the bills of quantities and a form of Tender can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the contractor upon the receipt of a bona-fide Tender and the documents which have been supplied to him.

Sealed Tenders, addressed to the Chairman of the Police Committee, and endorsed "Tender for Harpenden Police Station," must be delivered, under cover, to me here, not later than FIVE p.m. on WEDNESDAY, SEPTEMBER 29th, 1897.

Such security for the due execution of the Works as the Committee may require must be given by the contractor.

The lowest or any Tender will not necessarily be accepted.

URBAN A. SMITH,
County Surveyor.

No. 41, Parliament-street, S.W.
September 9th, 1897.

TO BUILDERS AND CONTRACTORS.

The London County Council is prepared to receive TENDERS for the ERECTION of a BUILDING for Stores and Offices at the Council's Main Drainage Works near Beekton, North Woolwich.

Persons desiring to submit Tenders may inspect the drawings and obtain the specifications, bills of quantities, form of Tender, and other particulars at the Engineer's Department, County Hall, Spring-gardens, S.W., upon payment of the sum of One Pound.

This amount will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the Tenderer, provided he shall have sent in a bona-fide Tender, and not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with.

The contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in, and form part of, the contract by way of schedule.

Tenders are to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, and marked "Tender for Store Building, Barking Outfall."

No Tender will be received after TEN a.m. on TUESDAY, OCTOBER 12th, 1897. Any Tender which

does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

C. J. STEWART,
Clerk of the Council.
Spring-gardens, S.W.
September 16th, 1897.

TO BUILDERS.

The Metropolitan Asylums Board hereby invite TENDERS for BUILDING a SHELTER at South Wharf, Rotherhithe, S.E.

The specification, conditions of contract, and form of Tender may be obtained at the Board's Offices as under, between the hours of TEN a.m. and FOUR p.m., upon depositing the sum of Five Pounds (£5) in gold or Bank of England note, which will be returned to the depositor if he sends in a bona-fide Tender in accordance with the terms of this advertisement. Each Tender must be accompanied by a copy of the quantities, upon which the Tender has been based, fully priced and monied out, and no Tender will be considered unless so accompanied, nor will any Tender be considered if detached from the specification.

The drawings can be seen (upon the production only of the specification, &c.) at the Offices of the Architect, Mr. T. W. ALDWICKLE, 1, Victoria-street, Westminster, S.W., between the hours of TEN a.m. and FOUR p.m.

Tenders (which will only be received upon the lithographed form supplied by the Board) must be sealed, and endorsed "Tender for Shelter, South Wharf, Rotherhithe," and must be delivered at the Chief Office of the Board as under, not later than TEN a.m. on WEDNESDAY, SEPTEMBER 29th, 1897.

The Board do not bind themselves to accept the lowest or any Tender.

By order,
T. DUNCOMBE MANN,
Clerk to the Board.

Strand, W.C.

September 14th, 1897.

**RUGBY URBAN DISTRICT COUNCIL.
SEWAGE FARM EXTENSION.**

CONTRACT NO. 1.

TO CONTRACTORS.

The Urban District Council of Rugby invite TENDERS for the CONSTRUCTION of the following WORKS in one contract—viz.:

(A) Main Effluent Outfall Sewer (24in. Pipes) from their Low-Level Sewage Farm to the River Avon.

(B) Diversion of Surface Water Drain near their Avon Waterworks.

The Drawings can be seen, and a copy of the specification, bill of quantities, and form of Tender obtained, at my Office on payment of Two Guineas, which will be returned on receipt of a bona fide Tender.

Sealed Tenders, endorsed "Outfall Sewer," to be sent to Mr. T. M. WRATISLAW, Clerk to the Council, on or before the 27th inst.

The Council do not bind themselves to accept the lowest or any Tender.

By order,

D. G. MACDONALD, A.M.I.C.E.,

Engineer and Surveyor.

Rugby, September 8th, 1897.

COMPETITIONS.**BOROUGH of COLNE.**

TO ARCHITECTS.

The Corporation of Colne invite Architects to submit COMPETITIVE PLANS for TECHNICAL SCHOOLS, PUBLIC LIBRARY, and PUBLIC HALL, proposed to be erected in Albert-road, Colne, at a cost not exceeding £5500.

Premiums of £50 and £35 will be awarded for the designs adjudged of sufficient merit, and placed first and second in order respectively.

The Corporation will be advised by a proficient referee in the selection of plans.

The premiated plans will become the property of the Corporation.

Particulars may be obtained on application to Mr. T. H. HARTLEY, Borough Engineer, Colne.

Drawings to be deposited at the Corporation Offices, Town Hall, Colne, on or before OCTOBER 20th next.

Town Hall, Colne,
Sept. 7th, 1897.

ALFRED VARLEY,

Town Clerk.

PREPARATIONS

Government Offices are being made for the erection of new Government offices,

Competitions.

Government offices,

and the necessary authority is being obtained from Parliament for the acquisition of certain sites. We understand it is definitely settled that the new War Office is to occupy the Carrington House site opposite to the Horse Guards. It is too late, and therefore useless to deplore the piecemeal manner in which all such schemes are undertaken in London. At different times different men of genius have made an effort to deal with such problems as confronted them in a broad and artistic manner—Wren, with his scheme for rebuilding the city; Inigo Jones, with his design for Whitehall Palace; and Barry, with his conception of a building for the Government offices. Had these been carried out in their entirety, London might have been the grandest, as well as the largest, city in the world. As it is, let us be thankful for the isolated buildings left us by these artists. Though it is too late to ask for any such complete scheme as Barry's, it is not too late to demand that every effort shall be made, and every facility granted, by those in authority to obtain the best buildings possible on the sites that have been chosen. The first requisite of a good building is a good site, and though that opposite the Horse Guards is not ideal, yet something could be made of it by a skilful architect, given a free hand. We suppose we may take it for granted that there will be a competition for this building. Had we an Inigo Jones with us now, we might be tempted to say, "Go to him, give him time and a free hand and he will give you a masterpiece." But failing such a man, we think a competition the best plan, *if properly carried out*. We do not intend to lay down the law as to how a competition should be conducted, but there are one or two points we consider advisable in this case. We are strongly of opinion that it should be open, and not limited to a few invited men of position. A large practice does not always mean artistic ability. Again, we think that in a large scheme like this, the better way is to hold a preliminary competition; just as few drawings as are required to explain the scheme, and to as small a scale as practicable; in fact, sketches showing the idea, with no attempt at elaboration. Above all, we hold that there should be a jury appointed to judge the designs. We do not mean a committee of officials and eminent personages with a professional adviser, but a jury of architects with perhaps one or two officials from the War Office. This principle was admitted in the competition for the former scheme for the Admiralty and War Office; it now wants development. But whether there is a competition or not, and if there should be, upon whatever lines it may be conducted, the foremost and most important thing is to demand that the arrangements for this building be carried out in such a way as to render Architecture possible. If the Government knows of any man of transcendent genius, with special knowledge of this class of work, let it go to him; but if it does not, let it arrange the competition in such a way as shall attract the best men—the artists—and give them a chance to do justice to themselves, and produce their very best. Let the conditions be favourable to Art

from the first, and when the best man is selected, let him have a free hand, or he will do no good. It is notorious that several recent public buildings have been spoilt by the interference of meddling officials, in matters about which they know nothing. Artists cannot work under these conditions, and it would be well if the Government would realize this fact. The Corporation has lately commissioned several well-known painters to decorate the Royal Exchange. We have not heard that its officials go down to the studios and insist on a certain length for Queen Elizabeth's nose, or on the colour of the toga of Julius Caesar. The interference of officials and committees on architectural questions is just as absurd as this would be. We have no doubt that a well-constructed building, of more or less convenience of arrangement, will be obtained, but we want something more than this, we want a work of Art. We want not only a building that serves its purpose, but also one that expresses it; a building that is not only a convenience to those that work therein, but also a continual joy to those that daily pass to and fro.

The Desecration of St. John's Wood.

SOME idea of the effect of the works of the Manchester, Sheffield, and Lincolnshire Railway (now the Great Central Railway) at St. John's Wood may now be clearly ascertained. A locality noted for its picturesque beauty and for the proportion of garden to bricks and mortar has been converted, under the authority of an Act of Parliament, into an uninteresting series of cuttings, enclosed by walls, &c., redolent of "engineer's architecture." It is useless to cry over spilt milk, but

surely, says Mr. William Woodward in a letter to the Times, the Company can have no desire to perpetuate its inroad into London by hideous surroundings, which distinctly emphasise its primary outrage. Lord's is now enclosed by a wall some 10ft. in height, faced with stock bricks and coped by red bricks semi-circular in section. This probably continues the character of wall which existed prior to the advent of the railway company, and, inasmuch as a peep over the wall discloses only the well-known cricket ground with its beautiful green turf and familiar pavilions, no substantial reason exists for objection. But within a stone's throw of Lord's the Company has formed an open cutting, and towards the Wellington Road and Wellington Place there has been erected, next the public footway, a wretched plain brick wall, some 7ft. in height, coped with common blue bricks, not even stepped to avoid the unsightliness caused by the fall in the ground, and extending for several hundreds of feet in length as a screen, not to green turf, but to a bare and bald railway formation. A short distance from this, along the Park Road, passing many more instances of "Engineer's Architecture," we can now see the sort of finish which will grace for a century or so this part of the undertaking. At Hill Street (or Boston Street) a bridge has been constructed enclosed by walls and iron railings of the very ugliest and most commonplace type, and the flank wall of a house, seen from the Park Road, has been simply "cemented" without the least attempt at relief by mouldings or other architectural feature. There can be no desire on the part of the public to lead the railway company into extravagant expenditure, but we have at least a right to expect that, where the works of the Company impinge upon public thoroughfares in what was a charming outskirts of London, those works shall be made as pleasant to the eye and as unobjectionable as

OLD HOUSES
CHURCH ROW
HAMPSTEAD
Fred Adcock

SKETCH BY F. ADCOCK.

it is possible to make them. Even a brick-enclosing wall may be made sightly, and curiously enough, in the very neighbourhood of the railway there are three examples of what is possible in the successful treatment of a brick wall. In the passage-way from Kent Terrace to the Regent's Park there is a brick wall, designed many years ago by the Office of Her Majesty's Works, a copy of which would have been delightful at Lord's and the Wellington Road. At the junction of Albert Road and Gloucester Road, there is an equally well-designed brick wall erected by a descendant of Pugin; and Mr. Willet, in a building speculation off the Avenue Road, has not only built a decent enclosing brick wall, but he has set it back and planted shrubs in front of it. Comparatively little has yet been done at St. John's Wood in the way of finish, but what has been done must cause alarm in the minds of all who care in the least for the future adornment of this part of London. A fine opportunity even now presents itself to the railway company to do all that is possible to make artistic and tolerable those portions of its works which so prominently obtrude themselves upon the public view, and I feel sure that an appeal to the Company will lead to an immediate reconsideration of its designs, and to a determination to construct the remainder of its works in a manner which shall present a complete contrast to those just finished.

ANCIENT METHOD OF WOOD GILDING.

By W. NORMAN BROWN.

IT is somewhat profitable and pleasurable to dip into the old-time authors, and to compare their method of working with that adopted in the present day. Thus, some short time since, dipping into a book published a little over a century since, the writer came across an interesting description of the method by which gilding on wood was effected in those days. In the book in question the author states that the art of gilding on wood was accomplished in one or two ways. In the one the leaf-gold was placed upon a coat of whiting, and called plain gilding, this method not admitting of burnishing. The whiting was laid upon the work in several thin layers, each coating being allowed to get dry. The work was then watered or dampened, and the leaf-gold gently laid upon it by means of a piece of cotton or soft puff. As the water was absorbed by the whiting the gold adhered, and the loose pieces of leaf were brushed off gently when the work was finished and dry. This was virtually "dead" gilding. In the second method of gilding referred to above, was that which allowed of the work being burnished, the gold in this process being laid upon a coating of gold size. The preparation of this size was supposed to be a trade secret, but the following recipe, the writer states, was considered among the best: Take 1½ lb. of the best pipe clay, ½ oz. of red chalk, ½ oz. of black lead, 40 drops of sweet oil, and 3 drachms of the best rendered tallow. Grind the pipe clay, red chalk, and black lead with water, but all separately, as finely as possible. Then mix these with the oil and tallow, and grind all together till the desired consistency has been attained. Workmen evidently moved slowly in those days, for the writer says that "this size is scarce fit for use till it has stood two or three years; if it stands twenty, it is still the better!" This must surely be a joke. Imagine a case of this size being handed down as an heirloom from father to son! Anyway, we are told that the size was laid on in two coats and allowed to dry, and when ready to lay on the gold the sized surface was watered, and then the leaf laid on. When the work had stood some time—possibly twenty years, for the author sayeth not—and had become thoroughly dry, it was burnished with a "dog's tooth." The author goes on to say that work gilded in this way will stand the weather for many years, especially if the size be old, "in which consists the chief beauty of the performance," which is another way of saying that the durability of the work mainly consists

upon the oldness of the size. Altogether, our forefathers were funny people, and it is little wonder that their work lasts so much longer than that of these days, when they took such a long time over it.

"THE MODERN ATHENS."

THE members of the Dundee Institute of Architecture, Science, and Art visited "the modern Athens" on the occasion of their annual excursion. The party was under the charge of Mr. Leslie Ower, the President of the Institute; Mr. J. J. Henderson, its secretary; while Mr. Hutton and Mr. Blackadder, members of the Council, gave assistance when required. The new McEwan Hall, which has been presented to the University by Mr. McEwan, one of the members of Parliament for the city, first claimed attention on arrival at Edinburgh. The hall, which is hardly finished, adjoins the Medical School, and is the crowning feature of that handsome group of buildings. Mr. Walter Clark, clerk of works,

an observatory site—a free horizon to the north and south, an absence of vibration, and the desire to have it near Edinburgh. Chimneys are undesirable neighbours, as the columns of heated air disturb the homogeneity of the atmosphere, so that there are as few of them as possible. There are a thousand and one special points which have to be kept in view in the construction of an observatory, and they were explained as far as circumstances permitted. For instance, the telescopes have to be mounted on pillars built on the rock, and rising up inside the building, but having no contact with it, so as to prevent vibration. Then the transit-house requires that the temperature should be the same inside as outside, and a considerable amount of ingenuity is expended in securing that result. They next turned their attention to the memorials of the past, and at the end of a short drive found themselves at Craigmillar Castle. The walls, round which the noise of war not unfrequently raged, are crumbling ruins. Mr. Ross gave an entertaining description of the building, mentioning its chief

OLD GATES AT KIRKTHORPE, NEAR WAKEFIELD. FROM A SKETCH BY R. A. BASDALE.

met the party at the entrance, and showed them over the place. The hall is circular in shape, contains a large "pit" and two galleries, and is capable of seating almost 3000 people. The accessories, in the shape of side rooms, corridors, &c., are of course very complete, and the fitting-up has been done on the most approved principles. Dr. Rowland Anderson is the architect of the building, and it has been in the course of erection for the last nine years. Mr. Clark gave a full description of the hall and appurtenances. The sculpturing and decoration of the building are, of course, on a magnificent scale. Everything appears to have been done handsomely and regardless of cost. The organ, which, it may be remarked, was not in the original plan of the building, has been erected by the Hope Jones Electric Organ Company, of Birkenhead. It is in seven different pieces, but has been so placed as not to look as if it was an afterthought. The feature of it is the console, which looks like an American organ, and can be moved about the hall at will, and placed where convenient. A long pipe containing 1700 wires connects the console with the organ proper. A glimpse into the interior of the instrument discloses a bewildering mass of wood and metal. The cost of the hall has been £110,000. The new Observatory on Blackford Hill next claimed attention. The visitors were taken into the library, and afterwards conducted to the roof, where they were treated to a short historical and descriptive statement with reference to the Observatory by Mr. Robertson, H.M. Inspector of Works. The building on the Calton Hill was incapable of holding the books and apparatus, and a more suitable site had to be secured. Mr. Robertson explained the indispensable conditions of

historical and architectural features. The party wandered through its large dining-hall, its kitchen, and endless rooms, and also stood in the chamber once occupied by Mary Queen of Scots. When the castle was built, and by whom, is not known, but the name is said to be derived from the Gaelic, *Craig maol ard*, signifying a high and bare rock. The name appears in many different forms throughout the centuries, and is first mentioned in 1137. The "castle, fortalice, and mill" of Cragmelor are definitely referred to in 1511. Its associations with Queen Mary are particularly rich, and evidently it was by the merest chance that its walls were not stained with the blood of Darnley.

The freehold of Turner's well-known house at Twickenham was put up to auction last week and sold for £1200, a figure that works out at about eighteen and a half years' purchase of the rental value. Evidently its associations had no marketable value.

The refuge-hut on the Zugspitze, the highest mountain in Germany, 10,000 ft. high, was opened recently. It stands on the grat between the east and west peaks, affording accommodation for twenty-two guests; and is built of stone bound together and fastened to the rock by massive steel bars, the interior being warmly lined with cork and felt.

While workmen were engaged digging a pipe track at a shipbuilding yard at Campbelltown, they unearthed a stone cist containing human remains. It was oblong in shape, and formed of four rough slabs of mica schist. It was about 3 ft. long and 20 in. broad at one end, extending at the opposite end to 2 ft., and was in depth about 2½ ft. The bottom consisted of gravel. Only a few bones were found in it.

STROLLING SKETCHES.*

No. 12.

By R. A. EASDALE, A.R.I.B.A.

BETWEEN WAKEFIELD, DONCASTER,
AND SELBY.

IN these days of cheap and easy travel it is possible for most architectural students to visit and study many of the finest buildings in the United Kingdom, and there are not many people who have not "been abroad" with this object; but how few, comparatively, really study the buildings they visit—and the number who take the trouble to make even rough notes of the salient features and characteristics of the work are, I am afraid, very much in the minority.

No doubt the splendid travelling facilities now obtainable are in some measure responsible for this state of things. Time is so precious and competition so keen that we almost unconsciously practice in our leisure the habits of our working hours—and put in as much work as possible in the shortest time. This easy travelling, too, is responsible for the neglect of many of our small though worthy old buildings.

It is a great temptation for a man to find that for a few pounds he can rush through old Normandy, or flit through one or two towns in Belgium or Western Germany. He goes hand-in-hand, probably with a professional cicerone, but what results can he show for the expense of time, money, and nerves?

I know several men who have returned from such tours with very little to say on the subject of the places they visited except execration unbounded on such things as sleeping accom-

modation, cuisine, and their own lack of linguistic ability.

No sane man will deny that travel is most necessary for the education of an architect, and travel abroad especially is a priceless boon to those whose means and command of leisure will enable them to do so unfettered by thoughts of business or home.

But to a man who cannot lay claim to these blessings, it is folly to spend one's hard-earned holidays abroad when so much work exists in England well worth everybody's attention, and that, too, at our very doors. I think that to us one of the greatest values of our ancient buildings is the fact that they have withstood the ravages of our trying climate—are suitable for that climate, and are truly English. Happily, England is still dotted over with interesting old buildings, and Yorkshire can lay claim to be, perhaps, second to none in this matter with other counties.

We are proud of our minsters, our abbeys, and parish churches, and the few old domestic buildings still extant—and it is of the architectural remains of the district between the well-known places of Wakefield, Doncaster, and Selby that I would speak.

I do not propose to treat of Wakefield Cathedral or Doncaster Parish Church, and only slightly of Selby Abbey, my concern being more with the comparatively unknown village churches, &c., lying in the country between those places, to exhibit sketches and drawings of some of them, and give a short description of each, in order to induce more of my fellow students to explore a part so strikingly rich in work of this kind.

Lines joining Wakefield, Doncaster, and Selby would, curiously enough, exactly form an equilateral triangle of eighteen miles length of side, and the whole of my specimens lie in this triangle or very near the boundary of it.

The district contains no building of any pretension to size or grandeur, but it is of no less value on that account. There is a great tendency to-day to ignore the "bric-a-brac," as it were, of our Architecture. The Royal Academy Architectural School and the Science and Art Department seem to encourage students to attempt measured work and designs far beyond their capabilities. For instance, one often sees attempts at designing cathedrals and town halls by students hardly out of their teens, and who would probably make a very indifferent design for a lych gate or reredos, or even for a small villa. This must be wrong, for, putting aside the ludicrous designs, how many times will a design for a cathedral be required in England during our lives? Yet many of us may have the designs of churches, country houses, &c., entrusted to us. Therefore I say the measuring and thorough studying of one or two parish churches, and the designs of say a pulpit, screen, lych gate, or parsonage, or a parish hall or wayside inn, is far and away better practice than attempting something which will never be of use, or bring down upon one the well-merited taunts of our brethren.

No one will deny that it is most important for every student to cultivate and perfect himself in the habit of sketching, for it should really become habitual for an architect to sketch nearly every bit of striking, effective, or worthy detail that he comes across.

The R.I.B.A. in its curriculum lays special stress (in its advice to students) on sketching, measuring, and making drawings of existing buildings and their details.

But I am afraid it must be confessed that these two important branches in an architect's training are either neglected altogether, or done in a perfunctory, heartless way, just to scrape through some exam., or get up the sheets of evidences of study.

METHLEY CHURCH. FROM A SKETCH BY R. A. EASDALE.

* Essay read before the Leeds and Yorkshire Architectural Society.

OLD HOUSE, METHLEY. FROM A SKETCH BY R. A. EASDALE.

Like everything else, sketching is not acquired without much labour, practice, and perseverance, and many difficulties and annoyances have to be overcome, not the least of the latter being the very candid and often uncomplimentary remarks of onlookers. Then, again, a thorough acquaintance with the theory of perspective is absolutely essential before setting out to practice from actual examples. I have heard stories of prodigies who have produced the best work without any knowledge of perspective, but I do not believe any of them. A course of elementary and even advanced perspective is the very thing for the sketching tyro.

Another enemy (to my mind) of the sketcher is the camera. To all beginners I say emphatically, beware of the camera. We owe a great deal, certainly, to that wonderful and useful apparatus, but my experience has been that as soon as a sketcher buys a camera his sketch book seldom, if ever, appears outside. I have known a good many young architects become infected with the craze for photography, with the result that they have done little in the way of sketching and measuring. The facility with which the representation of an object (be it large or small) may be taken is the fatal attraction. A village pump may be photographed as easily as a cathedral. The photographer can show you a complete representation of a building, but can he draw from memory any of its parts? That is the test. He cannot even give particulars of its walling, and other details; but if a person has conscientiously sketched the building, and made a careful drawing, he can easily reproduce from memory any part thereof. This is a most important matter, and amazingly useful when one comes to sit for an examination.

Then, again, beginners nearly invariably make the huge mistake of trying to produce a pretty drawing, imitating the dodges of the best men which appear in the journals. Mr. C. E. Mallows told us in his lecture last season what a mistake this was—and a big mistake, too. I think it was the late eminent architect, William Burgess, who made some strong remarks with respect to this subject of pretty sketches—but perhaps he rushed to the other extreme. Care should be taken that, as far as possible, mere affectation of shadows, foliage, and foregrounds should be severely left alone.

To all sketching beginners I say: Draw the building as you see it, and the result, if correct, will look pretty enough without any or very little shadow or foliage.

Mr. Stratton told us in his recent excellent paper what a voluminous sketcher and measurer Sir Christopher Wren was—how he wrote from across the channel to a friend that he was bringing all France home with him. The fact that such an illustrious man as Wren took pains to sketch and measure so much, should spur us on to emulate his example in that way.

I have been led to make the foregoing remarks from there being such poor competition for the handsome prize offered by our President last year for sketching. I expected quite a crowd of competitors for the prize—which meant engaging in this the most delightful occupation of our Profession.

There is no lack of examples, as I wish to show, so that cannot be the cause of this lamentable state of affairs. Possibly the counter-attractions of tennis, cricket, and other social enjoyments are in many cases the real causes of the poor competition last October.

Perhaps you will excuse me if I suggest that in order to reach the buildings around Leeds, a bicycle is, next to the sketch book, the most useful article. Without one of these inartistic machines, it is almost impossible for a Leeds man to penetrate the rural district around in the scanty spare time usually falling to the lot of members of our Profession.

Do not be retarded in purchasing a bicycle by the reports that the riding of a bicycle causes one's hand to shake at the end of a journey, and so unfit one for the delicate work to be done. I have frequently ridden sixteen to twenty miles before sketching—and that in the days when pneumatic tyres were things unknown, and cushions a luxury. After eight years of cycling and sketching, I can unhesitatingly recommend such means of locomotion as a healthful, delightful way of reaching the happy hunting grounds of the sketcher and measurer.

I have decided to explain the drawings in the order in which we should come across the buildings they illustrate if we took a tour in the district. Obviously this prevents any classification in styles, but I will treat of that after I have explained each sketch.

We begin our tour at Wakefield, the only place I have sketched here being the half-tim-

bered building in Kirkgate, commonly called the "Six Chimneys." It is one of the best examples in the neighbourhood of that style of building.

The old chapel on the bridge, at the bottom of Kirkgate, deserves a much more careful drawing, being a good example of the ornate decorated work of the fourteenth century.

Sandal Church, one and a half miles out of Wakefield, is of large plan—presumably much altered and restored—the place being, no doubt, the victim of the contending parties who waged war round Wakefield during the Wars of the Roses.

Past Heath Common, we come to the village of Kirkthorpe—a veritable Eden for the sketcher of tit-bits. Here we find a very interesting parochial foundation building of Tudor style—the plan being a set of infirm people's rooms grouped round a central hall. This hall has a large recessed typical fireplace at one end, and is lighted from the top of roof by means of three pretty dormers.

The church has not much about it which is very interesting, but the stocks in the vicinity are perhaps more so to many, as they are the only existing specimens of the kind for miles around. The upper wooden cross piece can be moved up and down in a groove in the sides of stone posts to allow insertion of the culprit's feet, and then locked to the lower wooden limb.

Opposite the stocks are some interesting wrought-iron gates—originally the entrance to Heath Hall—now only used for agricultural purposes.

About one and a half miles north of Kirkthorpe, Normanton Parish Church (mostly of Perpendicular style) contains a very peculiar tomb with Ionic capitals and quaint panels. The entasis of the engaged double columns is very distinct, in fact, the tomb is well worth measuring.

Taking Methley Church next in geographical order, we find a large church, with nave, chancel, and south aisle only, and a decorated tower and octagonal spire of good proportions. At the east end of south aisle is the Waterton Chantry, from which it is divided by an oak screen of perpendicular work; and the south wall of chancel is pierced with a magnificent tomb, that of Sir Robert Waterton, died 1424, and Cicely, his wife. There is some fine canopy work in this tomb, and the shields here, as elsewhere in the chantry, are very

full of heraldic devices, though sadly losing shape.

There was originally a Saxon church at Methley or Medelai—and this has been mentioned in Domesday Book. William the Conqueror parcelled out Methley to the powerful Ilbert de Laci, who built Pontefract Castle in 1081. I may mention that Henry de Laci, the founder of Kirkstall Abbey, was grandson to Ilbert of Pontefract. For 300 years Methley was an adjunct of the great castle of Pontefract, and for 300 years its domestic vassalage to this great seat of power and empire was unbroken.

All the Plantagenet kings were frequent visitors to Pontefract and the neighbourhood, and the meadows of Methley were the recreation grounds of that time for hawking, the jousts, and other mediæval pastimes.

The oak screen mentioned before is perhaps not a very pure example in some details, but I think it is very well worth studying and measuring, even if only for the fine carving in spandrels below rail and the cresting.

I noticed in the church a modern attempt to copy the before-mentioned oak screen. Whether lack of funds or inartistic taste was the cause I know not, but the screen is a miserable failure, for the whole spirit of the old screen is lost.

About 300 yards from the church stands the old manor house, with quaint gables forming a good skyline, and the massive deep chimney, all typical of the Tudor period.

Coming near Leeds, to Oulton, just at the foot of John o' Gaunt's Hill, is a pretty group of seventeenth century half timbered houses. The closeness of the uprights is noticeable, and the absence of any curved timbers supporting corners.

Kippax Church is well worth examination. Undoubtedly it was originally a Norman church, as in very many places the original

Norman herring-bone work appears, whilst traces of Norman arches may be seen on the north wall. Before being recently restored the tower had a Norman window.

A curious pedestal arrangement on top of the tower is said to have been used to carry the beacon—which served as a guide to the surrounding valleys—when all around was one huge forest. The various types of window are worth mentioning, and the little priests' door into chancel, which must be Norman.

This church contains a font of peculiar design, curiously enough dated exactly the same as that at Birkin, some seven miles away.

Going three miles east of Kippax, we come to Ledsham, passing Ledston Hall on the way—a huge Elizabethan house, with characteristic gables and turrets. Ledsham is one of the most picturesque villages in the district. The cottages are worth sketching, particularly some quaint chimneys, and the old Manor House, gabled and mullioned.

Ledsham Church is beautifully situated in the heart of the village, on rising ground, and is almost surrounded with fine umbrageous elms; and the only good view of the church is from the west, as seen in sketch.

The church is reputedly of pre-Conquest origin, and no doubt it is most probable that such was the case. The lower part of tower, nave, walls, and chancel arch look like pre-Conquest work, and the little doorway at foot of tower, with its running leaf ornaments, and the long imposts from which arch springs, as well as signs of "long and short" work in the jamb stones—all these facts point to the existence of a Saxon church here. The tower is square, with no buttresses. The upper part of tower or belfry is Norman, with bold windows, and there are some decorated or perpendicular embattlements, pinnacles, and spire.

The plan of the church consists of tower, nave—north aisle only—and chancel. The

north aisle extends nearly to the face of east wall of chancel, and that part alongside chancel is the private chapel of the Wheelers, of Ledston Hall, descendants of the renowned Lady Betty Hastings, who endowed the adjoining almshouses and school. The east end of the church contains three lancet E.E. windows and the Vesica Piscis above.

About five miles north of Ledsham one comes across an odd-looking building standing alone in the middle of a field, without approaches of any kind, and called by some Lead Church, and others Lotherton Chapel. I thought the bell turret and doorway worth sketching. Going a little out of our way to visit Bramham, we find another Norman tower, similar to those at Kippax and Ledsham, with spire like the last named.

Coming back past Lead Church, about 1½ miles bring us to Saxton, a little old-world village, with a very ancient-sounding name, leading one to expect a very old church. I was disappointed with the building, and only sketched the tower.

Sherburn Church, about two miles from Saxton, south-east, has a very ancient history. Sherburn-in-Elmet probably obtains its name from the fact that in Saxon times it stood on the eastern boundary of the woodland fastnesses of the British Kingdom of Elmete, and on the edge of that kingdom ran a stream which "sheared" or "cut off" the British from the Saxon realm. Hence the name Sherburn.

In a manuscript in York Minster library are some notes of the existence of a Saxon church about the year 900 A.D. Athelstan had a royal demesne here when he first gathered together Saxon and Angle, and naturalised Dane into one English nation to combat the allied forces of Gael, Scot, and Northman. In 959 he gave his palace and Manor of Sherburn to the Archbishop of York and his successors,

KIPPAX CHURCH. FROM A SKETCH BY R. A. EASDALE.

and richly endowed York, Beverley, and Ripon Minsters in commemoration of his success.

The church is a large one, with nave, aisles, chancel, south porch and chapel at side of porch, and massive square tower with tremendous buttresses. Most of the exterior is Perpendicular work, but internally we find some Norman arches on cylindrical columns. A transitional Norman Early English doorway to porch is very interesting.

Monk Fryston Church (about three-quarters of a mile south of Milford Junction) is well worth visiting. Archbishop Thomas the First gave the Church of Fryston to the monks of Selby in 1070-1100. The original Norman Church was probably built by Archbishop Thomas.

Before the recent restoration by Mr. Hodgson Fowler the church stood as in my sketch. I was most fortunate in happening to visit this place a week before the work was commenced, in fact, the roof covering was removed at that time. The lower part of the tower is Norman to a height of about 30ft., and there exists in the upper part four early and very interesting windows of two rudely-headed semicircular lights with central midwall shaft, and quasi-cushion capital of oblong form. This tower, which is 9ft. square inside, was probably Archbishop Thomas's work, and his church most likely consisted of small nave with chancel and apsidal termination, as at Birkin.

The rest of the church is mostly Decorated work, one date assigned being 1338. A few pieces of splendid stained glass of this date bear comparison with some in York Minster. The date of aisles being widened and clerestory built was fifteenth century. Originally, it is said, the nave and aisles were under one roof, as at Skelton, York. On each side of the chancel arch are hagioscopes, or squints, and the stability of the arch itself is somewhat jeopardised in consequence. During the recent restoration, I believe it was found that much of the foundation was in a hopeless state, and it became necessary to resort to the difficult and costly process of underpinning the walls, and the piers and arches had to be shored up one by one in order to do this. The whole was carried out most satisfactorily.

(To be continued.)

PRESTON TECHNICAL SCHOOL.

OPENING CEREMONY.

SPEECH BY LORD DERBY.

THE new Technical School in Corporation Street, Preston, which has been built out of funds provided by the trustees of the late Mr. E. R. Harris, on a site given by the Corporation, was opened by the Countess of Derby recently. The Council of the Institute ten years ago came to the conclusion that a technical school would form a fitting memorial of Her Majesty's Jubilee, and the present substantial, and at the same time ornamental, edifice is the result. It has been built from the designs of Messrs. Cheers, Aspinwall, and Smith, and will cost, exclusive of furnishing, probably about £15,000. It comprises a weaving shed—one of the largest in the county—a large spinning shed, a textile museum, a lecture hall, class-rooms, and every provision for teaching the staple trades of the district. Special rooms are set apart for classes in mechanics and engineering, machine and building construction, carpentry and joinery, plumbing, &c. Active steps are at present being taken to equip the building with machinery and all the most modern appliances for teaching the various industrial processes. Some valuable gifts of machinery have already been made by large firms in the district, and it is expected that similar contributions will be received from other sources.—The President, in the course of a brief speech, explained the objects of the Harris Institute, and claimed that those associated with it endeavoured worthily to take their part in maintaining the industrial supremacy of the country. The Technical School, which they had been able to provide by means of the wise

generosity of the first Harris trustees, would enable them to do that more effectually. The variety of their work had so much increased, and the number of their students had become so greatly extended, that that new building had become a necessity. In speaking of the Art and Science teaching at the Harris Institute, he was glad to be able to acknowledge the very handsome gift of £2600 to the funds of the Institute by the Rev. C. H. Wood and Dr. Hodgson, the trustees of the will of the late Miss Tuson. This gift had set free other funds, and thus enabled them to provide for the purchase and equipment of the Glover Street school, where domestic science was taught.—The Countess of Derby then declared the school open, and expressed a cordial wish for its future success.—The Earl of Derby referred to the great growth of interest in technical education during the reign of the Queen, and especially during the last decade of that reign. He thought no other movement would so distinctly impress itself upon the future of the country. Not very long before the first Jubilee of the Queen the movement for technical education was only in its infancy, although there were some, the pioneers of the movement, who realised the importance of the question, but still they were a minority, and anyone who had expected to find technical instruction going on through the country would have been woefully disappointed. There had always been a glimmering in the northern counties that there was something to be learned between the ordinary education of a child at school and the later education gained in technical, artistic, or scientific subjects, according to their position in life. The evening schools had always been a marked feature of the educational work carried on in the northern and especially in the manufacturing districts; and at the present moment there existed the Union of Institutes for Lancashire and Cheshire, comprising, he believed, over 100,000 persons, who were connected, some practically, some in theory and goodwill only, with the work of advancing education out of the ordinary working hours; but the technical instruction movement had come in to supply much that was lacking. Those who now supported technical education had at their command a supply of funds which was sadly lacking to those who were only advocating the evening schools, but the object was much the same. Technical education showed them how to do on recognised principles that which was to a great extent formerly done by rule of thumb. There was one fear only with regard to technical education, and that was the danger of the various educational means giving in some matters the same instruction. He had been at a meeting in Manchester the previous evening, at which the School Board, the Technical Instruction Committee of the City Council, and the representatives of Owens College had met with a view of obviating that, and arranging that that which was elementary should be taught in the elementary schools, that which was technical in the technical schools, and that appertaining to the highest knowledge in the College. Thus children could be taken gradually from the lowest to the highest educational point. He did not say that that could be done anywhere. As yet they had not in Preston anything like the Owens College, but it might come in time, and, at all events, they had the various gradations by which children might be taken from one class or another, thoroughly grounded in elementary knowledge, and then drafted on to technical, scientific, or artistic work. He did not wish to speak disparagingly of Art, but, still, in such a land as ours the future depended more on technical work than upon Art. He asked where was the same man or woman who would say that our efforts should be relaxed in regard to this movement. Whatever they might be doing, they could depend upon it that foreign countries also were very much alive to the value of education. He instanced especially the great work which was being done in Germany, and the thorough training which was there supplied to the people. There, he said, they would have in a technical school not one or two looms, but every variety of loom, and the student was

taught how to obtain the best result from each one. Englishmen were apt to speak rather disparagingly of anything produced in Germany, but he was not sure that there was not sometimes a note of envy to be detected. Was not Germany advancing at a great rate, whilst England, perhaps, was content to go a little slower? He was afraid that it would be found that, whilst this land had advanced much during the last fifteen years, other countries had done still more, and it was essential that this work should be taken up throughout the length and breadth of the kingdom; that education should be valued not only as an abstract possession, but should be applied to the better conduct of that trade in which the people were engaged. He hoped the managers of the school would see their way to co-operate with other public bodies. Preston had always been proud of the position it had occupied in regard to its school teaching, and whilst it had its own peculiar way the inspectors reported favourably upon it. They hoped that the same cordiality would be extended towards this new institution, and that the building might prove to be an earnest of that spirit which would hereafter inspire a still larger Preston to carry on the work, and give operatives and others an opportunity of acquiring that technical and scientific knowledge which could only be learned when the two were properly combined. If Lancashire was to continue to hold the position it proudly believed she now held as a leader in technical work, there were those present who by word and deed could assist her.—The Mayor of Preston moved a vote of thanks to Lord and Lady Derby, which was seconded by the Rev. G. Steele (vice-president of the Institute), supported by Sir John T. Hibbert, and carried unanimously.—A vote of thanks was afterwards awarded the president, on the motion of Sir Thomas Storey, seconded by the Rev. S. A. Steinthal, chairman of the Union of Lancashire and Cheshire Institute.

EXMOUTH'S memorial to commemorate the record reign is a clock tower, now in course of erection on the sea front. It will stand 45ft. high, and for the most part be of Bath stone.

THE sewerage outfall works of the Oldham Corporation will be formally opened to-morrow (Thursday). The new system of sewerage disposal has, as a matter of fact, been in operation for some time.

WHILE the quarrymen were at work in Crowhurst Quarry, between Battle and Hastings, a magnificent fossilised bone, measuring about 30in., was found embedded in the blue stone. For some time past fragments of huge bones have been discovered in the blue marl, but beyond fossil mussel-shells little had been brought to light.

THE Stafford Corporation Sewerage Works, which have cost £45,000, were opened the other day. The work has taken three years to complete, and something like sixteen miles of deep main sewers and eleven miles of branch sewers have been laid. The sewage is first treated at the sanitary depot, where a destructor and sewage pumping machinery and reception tank are erected, thence it is pumped to a farm half a mile away. Here the sewage will be treated by precipitation and filtration on the land.

THE pollution of the River Lea in the metropolitan district is again becoming a matter for serious consideration. According to a report of the Public Health Committee of the Hackney Vestry, which will be presented to the vestry at its next meeting, the matter has been under the consideration of the local authorities for some time past. Samples of the river water have been taken and analysed from time to time, and the result of these analyses, which have been submitted to the vestry, show conclusively that sewage contamination of the river is going on from some source or another. Copies of these analytical reports have been forwarded to the Local Government Board, the London County Council, and the Lea Conservancy Board, but beyond formal acknowledgments the Committee is unaware of any action being taken to remedy the existing state of things.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

September 29th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THERE is an unconventionality about the address card of Nelson and Edith Dawson. From the intricacies of the lithographed card we infer that Mr. and Mrs. Dawson have removed their habitation to Swan House, Chiswick Mall, W. At the foot of the card is the Thames—portrayed with quaint originality. Above the river is a plan of parts of Chiswick and Hammersmith; the last-mentioned district is denoted by a hammer held upright by the smith as it rests upon an anvil. Above this plan of the roads leading to Chiswick Mall is a train on a sort of elevated Brooklyn Bridge, but we are assured that this is not American tallness—the train is merely running into Ravenscourt Park Station.

It is gratifying to note the manner in which local opinion is becoming alive to the value of properly arranged art galleries in all the more important of our provincial towns. The decision of Glasgow to spend a sum of £100,000 on a new museum and Art gallery, and the outcry at Manchester concerning the inadequacy of the present Corporation gallery, are not isolated instances of the spread of this feeling, for in many other directions steps are being taken to provide suitable accommodation for the disposal of art work. At Reading, for instance, a new art gallery which has been added to the municipal buildings, is to be opened about the middle of next month, and about the same date the Duke of Cambridge will lay the foundation-stone of a gallery at Bath. We may fairly hope to see in a few years time a building of this type existing in every centre of population, and to find periodical exhibitions of works of Art recognised as valuable adjuncts to any scheme of public education.

THE long-talked-of reconstruction of Highgate Archway will soon be commenced. Designed by Sir A. R. Binnie, the engineer of the London County Council, the new viaduct will consist of one great span of ornamental ironwork, on the spandrels of which will be displayed heraldic shields bearing the cognizances of the five authorities contributing towards this costly work. The tender of Mr. C. Wall, of Chelsea, for £25,126 has been accepted, and two-and-a-half years allowed for the completion of the contract. The existing structure, at one time considered to be such a marvel that people would make long excursions to see it, cannot be considered very wonderful to-day, when Tower Bridges and Severn Tunnels have their rivals, but still it is imposing, if also ugly. Its height to the crown of the arch is 86ft. above the roadway. Built before iron and steel had come largely into engineering schemes, it is a very solid structure of stone and brick. The new Highgate Archway will be welcome, if only for the lightness of its construction.

SOME twenty years ago, when it was proposed to remove the tower of Hampstead Church, strong objection was taken to the scheme on the ground that Hampstead's

associations were essentially of the last century. Eighteenth-century brick, indeed, distinguishes London's breeziest suburb as surely as eighteenth-century poetry has left the impress of its memories. Of all such buildings left intact none are more picturesque or more alluring in their softened colour than the line of houses known as Church Row, and, as most people are aware, Church Row is threatened. Plainly it is within the right of an enterprising builder to put the more profitable new in place of the more beautiful old on his own ground, and it is made equally plain that public bodies have no power to interfere. Sir Walter Besant sent a vain appeal on behalf of Church Row to the County Council, and now the Hampstead Vestry, on the recommendation of their Free and Open Spaces Committee, have given a similarly negative answer. In his letter to the local body, Sir Walter, himself a resident in the neighbourhood, remarked: "I want to interest you in the threatened destruction of the beauty of Hampstead by flats. I know that certain flats have been put up in Frognal, and now Church Row is threatened. Can the Vestry do nothing?" The Vestry cannot, but private enterprise might.

ONE of the most extraordinary mediæval paintings in glass of "Our Lady of Pity" may be seen in the east window of Long Melford Church. It represents the Virgin Mother with the emaciated nude body of her adored Son reclining upon her lap, and all over the body are punctured wounds in the form of a crescent, from which exude three drops of blood—and the wound in the side is large and ghastly, from which blood is freely flowing. Round His head is a rough crown of thorns, with cruciform nimbus and rays far extending above the head. Beneath is a kneeling friar, the donor, no doubt, of the painting.

SCHOOLS OF ART are just commencing the winter term. As a technical educational agency King's College takes high rank, and is deservedly held in high esteem for the instruction there given in Architecture, building construction, and modern practice. Professor Banister Fletcher, F.R.I.B.A., is at the head of this division, Mr. Banister F. Fletcher, A.R.I.B.A., is the lecturer and studio instructor, Mr. H. P. Fletcher, F.S.I., A.R.I.B.A., is the assistant lecturer, and Mr. James Bartlett the demonstrator; so that the teaching is in capable hands, and very good results have been obtained. The courses of instruction are intended to furnish full information in the theory and practice of Architecture and building construction, and in the application of the principles of mechanics to construction; whilst a special course has been arranged for students who wish to prepare for the R.I.B.A. and other examinations in one year. The series of evening lectures has been very carefully arranged to the best advantage, and the architectural studio and reference museum are found of material assistance to the student. The London County Council has arranged with the College for a series of lectures on "The History of Architecture," by Professor Banister Fletcher, during Michaelmas and Lent terms; and other signs of increased vitality on the part of the College are not lacking in the syllabus of the session commencing on the 4th prox.

MR. EDMUND PHIPPS writes to the Times from the Windham Club, S.W.:—"A passion for uniformity has led the Westminster Vestry to lay down asphalt in Queen Anne's Gate. Its next step is harder to understand. On the southern side, just where Queen Anne's statue stands, the line of the street is broken by a sharp corner, beyond which the street broadens out westward. The pavement follows the right angle thus formed, and this break is not the least charming element in the peculiar beauty of this quiet, old-fashioned street. But the vestry has gone out of its way to smooth out half the effect of the corner by carrying a new pavement from the point of the angle to join the old pavement some thirty yards further west. I can find no corresponding

advantage to compensate for the painful result. The pavement was already of ample width; the roadway will be now far too narrow for the many carriages which have to wait in this part of the street during the season. We did not want the asphalt. Certainly we did not expect so senseless a narrowing of the road."

PROUDLY a Canadian firm announce that in a town in the Dominion it has erected in six days four hours a large business building. Presumably the chief material of the structure is timber. What do English builders say to this rapid rate of construction? The boast reminds one of the circumstance that the Royal Amphitheatre, in Great Charlotte Street, Liverpool, which is now the Royal Court Theatre, was built within the short space of six weeks.

THE building of the new Westminster Cathedral is proceeding amid a chorus of complaints from the residents in the vicinity. There are a number of flats around Ashley Place, and for some months the dwellers therein have not had a single quiet moment, except at night and on Sundays. There is some talk of the local authorities being appealed to with the object of compelling the builders to moderate the nuisance. The complaints, of course, are not directed against the ordinary noises incidental to building operations, but principally against the continual stone-cutting by the steam-saws—work which, it is alleged, could easily be done elsewhere.

GREAT interest is still being shown in the Castle Hill controversy at Scarborough. The Marine Drive, which will cost something like £100,000, is being proceeded with very rapidly. Within the past three months the appearance of the hill on the north side has been quite transformed. By the 1st inst. more than 200ft. of wall, 18ft. high, or within 4ft. of the finished height, had been completed. Steam cranes and locomotives, with a small army of men, are engaged throughout the day, and every effort is being made to push forward the work before the advent of the "north-easters." The concrete blocks are made at the foot of the hill. The heaviest, which are used in the foundations, weigh about five tons each. While there has been much opposition to the construction of the drive, there have been many assurances that the work will be the means of preserving the hill, which during the last fifty years has been lessened by 3½ acres through the erosion of the sea.

THE work of executing the statue of the Queen which has been subscribed for by members of the Junior Constitutional Club in Piccadilly, in commemoration of the Diamond Jubilee, has been entrusted to Mr. Brock, R.A. The statue, which will represent Her Majesty a little over life-size, will probably be placed in the vestibule of the building. Lord Salisbury is president of the club, and occupied the chair not long since at one of the most successful house dinners ever held within its walls. He will probably be called upon to unveil the statue when it is ready. Those who take an interest in this branch of Art ought, when possible, to go the round of the best London clubs. Many fine pieces of statuary work are hidden away in dim corners at these places.

It is understood that Mr. Whistler has been approached by a syndicate with a view to arranging that all his work in this country shall pass exclusively through its hands. An agreement appears to have been come to, and there will shortly be opened a gallery, in the neighbourhood of Manchester Square, devoted entirely to Whistlerian Art. Admirers of the Artist's somewhat erratic genius will receive the information with satisfaction. A Whistler Gallery has long been desired.

FOR three centuries there existed over the monument of Cardinal Pole, in Canterbury Cathedral, a representation of the arms of the late prelate, supported by two angels, and the escutcheon being very historically interesting, the late Canon Jenkins, who was a great

authority on heraldry, proposed before his death that these arms, which contained sixteen quarterings, some of them of families which have since become extinct, should be repainted. It is this work which Cardinal Vaughan and the other Roman Catholic visitors of ten days since have undertaken to provide funds for, as a recognition of the kindly welcome and courtesy extended to them. The tomb will be left exactly as it is, simply being enriched by the reproduction of the arms. Canterbury Cathedral is probably one of the greatest museums of heraldry in the kingdom. No less than 800 coats of arms were put up by Archbishops Courtenay and Arundel in the cloisters, apart altogether from those all over the roofing of the nave.

A CONSIDERABLE amount of antiquarian interest attaches to the disappearance of the Brockley Jack, one of the oldest licensed houses in London, which is about to be pulled down. There is much more in the way of tradition than of actual history connected with this well-known house, but it is pretty generally accepted as fact that it has been in existence over 500 years. It is believed to have been erected during the closing years of the Plantagenets, and it was then, and for many years afterwards, the only house in the immediate neighbourhood, and stood a solitary sentinel by the side of the great road into Kent. Within the last five or six years the London, Chatham, and Dover Railway has conferred its questionable advantages on the neighbourhood, and a new suburb is springing up round this relic of the past. That settled the fate of the Brockley Jack. The custom remained, and, indeed, increased, and a fourteenth century building, which has had on occasions to be held together by artificial means, does not meet the requirements of the neighbourhood. Thus the oldest licensed house in the county of Kent is doomed, and within the next few weeks the irregular heap of mediæval buildings will be razed to the ground to make room for a palatial public-house on modern lines, which is to run a considerable distance into thousands of pounds in the matter of cost. From an architectural point of view this may be an improvement, and it will doubtless be more in keeping with its suburban surroundings, but one old landmark will be swept away and a connecting link with the past broken, and the new palace will be an even less effective reminder of the old Brockley Jack than the ridiculous griffin is of the imposing and dignified Temple Bar.

THE excavations at the recently-discovered "Romerkastell," near Holzhausen, in the district of Wiesbaden, have laid open four gates with their towers. Over the north-western gate, Porta Sinistra, a magnificent description in honour of Caracalla, of the year 213 A.D., has been deciphered. Traces of a large and not less splendid inscription have been found on the most stately of the four gates, the Porta Prætoria, but it is in too broken and fragmentary a condition to be deciphered. Numerous silver coins of Caracalla, Septimius, and Alexander Severus have come to light, all of which are in excellent preservation; a silver arm-ring, a primitive leaden arm-ring, fragments of glass vessels and of the so-called terra sigillata. In the neighbourhood of the Prætorium was found the broken head of a genius with the mural crown.

We have received a reprint of the annual sermon of the Church Sanitary Association, delivered in All Saints' Church, Tufnell Park, by the vicar, the Rev. W. J. Hocking, on August 1st. It is an eminently practical discourse, and full of plain speaking, as witness the following:—"Science is making it clearer and clearer every day that not only diseases, but a very large proportion of the deaths of the country, are attributable to causes which have been evolved out of things for which men are directly or indirectly responsible. It is, therefore, not only foolish piffle, but insulting ignorance, to say that the good God wills these things, and that we must resign ourselves to them." There is a mediæval simplicity and homeliness about these remarks

which go far to excuse the lapse into slang terms. We are in full accord with Mr. Hocking when he contends that dirt and disease are not part of the Divine order of things, and also that it is the duty of the Church to care for the bodies of men as well as their souls. Formerly she always did; the first hospital in London was a monastic establishment; it was the Church that drained fens, brought waste lands into cultivation, and taught people the advantage of living a healthy, regular life by rule. Even as late as the seventeenth century it was the Orthodox Church of the East which provided for the care and isolation of lepers, and every parish priest going in and out among his flock ought to impress upon its members the paramount necessity of cleanliness, and, as Mr. Hocking says, not be afraid to tell landlords when their property is in an insanitary condition. The simple laws of health and sanitation ought to form a part of the examination of every candidate for ordination, for amid unhealthy and filthy surroundings a healthy and moral mind is all but impossible.

AN interesting archaeological discovery has been made in Paris during the process of excavation for drainage purposes, the workmen having brought to light part of the wall erected by the once famous monarch, Philip Augustus. On these ruins was afterwards built a Chapel devoted to the Knights of the Order of Notre Dame de la Redemption des Captifs, an order founded in 1218 at Barcelona, conducted under Augustinian rules, and occupied solely with the ransoming and succour of mediæval prisoners of war. And now Barcelona is the headquarters of the Spanish Anarchists.

THE municipal engineering works of Manchester have on several occasions been of considerable magnitude, and in some instances even of a sensational character; but the results of the latest development of Manchester's engineering activity will be watched with an interest which has hardly been excelled by any of the previous undertakings. The Corporation of Manchester is proposing to go to Parliament to obtain powers to construct a conduit which shall convey the sewage of the town down the Mersey and discharge it into the river near the sea. The work is to cost something over a quarter of a million sterling—how much over that figure remains, of course, to be seen. The original estimate is for £258,000, though, as the Manchester Corporation, with the Ship Canal before its eyes, know only too well, original estimates are not always very stable foundations. The project has its interest for Bradford, for, whatever temporary expedients and experiments the Bradford Corporation may resort to, to deal with the sewage of the city, some such scheme in the future looms ever before it. Though Bradford is badly situated with regard to sewage disposal, Manchester, is, perhaps, rather worse, for it has not even a large river like the Aire into which to turn the effluent from its sewage works. It has, indeed, to discharge it into a canal, and as is obvious, it is almost impossible, whatever methods may be adopted, to turn out such an effluent as should be entirely satisfactory under those circumstances. The proposal is threatened by the opposition of Liverpool.

SOME of the brick houses in Battersea are turning from red to blue, causing the people to suspect some noxious influence in the air. Suspicion at first fell on neighbouring chemical works, the proprietors of which, however, protested their innocence. The medical officer of health (Dr. Kemp) was appealed to, and he was of opinion that the phenomenon was not due to fumes from the works in question. Admitting that sulphuretted hydrogen from sewers might give a bluish tinge to bricks originally red, he denied that the drains of the district gave forth that gas. The mystery is therefore complete, and the inhabitants of the district are not reassured. It is suggested that the change is due to the development of something in the bricks.

THE current exhibition of the Birmingham Society of Artists is this year unusually good, and although the number of works it contains is small, when compared with those in the larger displays of Liverpool and Manchester, exhibits are so varied that they represent nearly every phase of current British Art. Sir E. J. Poynter, P.R.A., contributes his "Horæ Serenæ"; and other important contributions are "May Morning on Magdalen Tower," by Holman Hunt; "The Close of Day," Peter Graham, R.A.; "The Dream of Launcelot," Sir E. Burne-Jones; "Hampstead's Happy Heath," David Murray, A.R.A.; besides characteristic examples by G. F. Watts, R.A.; Val Prinsep, R.A.; James Sant, R.A.; J. Aumonier; and Arthur Hacker, A.R.A. One of the most striking landscapes on the walls is Moffat Lindner's "Storm Cloud," which though severely simple in composition and restrained in colour, is at once both luminous and restful. "A Reverie," by Edward S. Harper, is noticeable for the richness of its colour scheme and the dexterity with which the most brilliant and varied hues have been wrought into a harmonious whole. C. T. Burt essays a new departure in "We Join the Chase," in which he has been successful. "Red Riding Hood," by Charles M. Gere, though well intentioned, fails to show the artist at his best. His little landscape studies, however, are charming. "A Tragic Sunset," by John Finnie, A.R.E., is a powerful piece of work, strong in colour and full of feeling, the contrast between the lurid light of the sunset and the gloom of the coming storm being admirably suggested. In quite a different spirit has John McDougal conceived his large water-colour "The Peace of Evening Crown a Golden Day."

MR. PRITCHARD, the civil engineer who has been instructed by the local authorities to inquire into the proposal for a new lock below Putney Bridge, reports that, owing to the removal of several bridges, the construction of embankments, and the dredging of the river bed, the surface level of the river at low water spring tides between Richmond and Strand-on-the-Green is receding an inch and a half a year. This, he holds, clearly shows that a weir across the river below Putney is necessary. The line he suggests as the most suitable for its construction is drawn from Broomhouse Dock Lane on the Middlesex side to a point directly opposite. The work would be both long and costly, a period of from three to four years and an expenditure of a quarter of a million being required for its execution. This, of course, is due to the width of the river, which at that point is more than double that at Richmond Lock, and to the depth of the water. Formidable as the undertaking appears, there can, however, be little doubt of its ultimate utility.

A RECENT issue of the Bulawayo Chronicle contains the following:—"Messrs. W. G. Neale and George Johnson returned some few days ago from an expedition, ranging over a wide stretch of country, which they undertook more for the purpose of exploring and locating undiscovered ruins than of working those already 'pegged out' by the Company. The country traversed, chiefly in the north, embraced the lower Shangani, the lower Umvumque, the lower Sebakque, the lower Gwelo, and the lower Inyati districts, most of these being unexplored before in search of ruins. In all, Messrs. Neale and Johnson located more than eighty-five "new" ruins, and one of them appears to be unique, and of quite exceptional interest from an archaeological point of view, as it differs entirely from any known to the discoverers, and they speak from a knowledge of upwards of 200. In shape alone this ruin resembles the celebrated Zimbabwe ruins, but the walls, which are perfectly intact, about 15in. thick and 15ft. high, seem to be made in a different way and of a new form of masonry. They do not consist of either bricks or tiles, but appear in one solid piece of glazed material, as if burned after they were erected in position. If this impression of the discoverers is borne out on re-examination, then we have a new method and material of

building hitherto alien to the country, and probably to be referred to a different race of people from the ordinary ancient workers. The ruin shows the remains of a well-shaped doorway, and also, which is an unusual feature, an aperture about 4ft. high and 3½ft. wide placed some distance up the wall, and which was without doubt a window. Altogether, the ruins are a proof that the original inhabitants were a people who had attained a high standard of excellence in the art of building. Some fine gold was found in the *débris*, but Messrs. Neale and Johnson were unable to properly explore the ruin owing to its distance from water. The tradition that there exists an extraordinary ruin in the country, the building of which still has in position massive stone doors, and which is regarded with superstition by the few natives who know of it, and whose doors have never been opened, Messrs. Neale and Johnson heard sufficient evidence of to regard as an actual fact, but owing to its being situated in a very unhealthy district, they have had to postpone visiting it for the present."

the district. It is curious to note that the square-capped pinnacles appearing in the sketch, which make so characteristic a feature in the south clerestory parapet, are in the north conspicuous by their absence. The disposition of the masses, and the masterly way in which the tracery, diaper work, and other details are conceived and executed, create an unusual richness of effect in sunlight, and a subdued, mysterious beauty in its absence. As a whole, the interior is unworthy of its envelope. The mannerism of straight lines, and an arbitrary symmetry of parts peculiar to the period, produces the irksome sameness of an unbroken ridge, and permits a grasp of the entire church at a glance. That these æsthetic conditions were not satisfactory to the builders is probably evidenced by the lavish thought and work expended on a rood-screen and loft of singular magnificence, judging from the remains left to us. The screen extends the whole width of the church, higher in the nave than the aisles. It was doubtless surmounted by lofty figures and a most probably much loftier cross, forming an effective break of

the foot of which is the entrance to the old bar-room, now used as an office, with the heavy main and smaller crossbeams of its low studded ceiling. From this a door leads directly into the small taproom, thence to the landlord's dining-room with its old mahogany sideboard and round table of the same material, its small window panes and wide empanelled fireplace. We next cross the rear of the hall to the old breakfast room, papered in the old large-figured style, and pass on into the long dining-hall. Here the beams above and the high wainscoting and woodwork of the sides are painted a pure white, while the walls and ceiling are a chocolate brown. On the floor above are several large bed-chambers with ancient furniture, and a large dance hall with brightly polished floor and large fireplaces at both ends. Long benches run from end to end on either side, and the quaintly papered walls reach the ceiling, not at an abrupt angle, but with a gentle curve, giving a gracefully arched effect to the room. Descending the stairs, we enter the parlour situated across the

SOUTHWOLD CHURCH. FROM A SKETCH BY JOHN W. RHODES.

APPARENTLY we shall have a statue of Cromwell before a site on which to erect it. This is a result of some of the recent discussions in Parliament, but for which probably a statue of the great Protector would not have been thought of. The statue is the work of Mr. Hamo Thornycroft, R.A.; but before it is erected on any ground that can be called national property, there will be some more fierce speeches from the extreme Tory wing in Parliament.

THE fine, early, perpendicular, flint and stone-faced church of Southwold is dedicated to St. Edmund. Uninterrupted views at all points can be had of its admirable proportions except from the East. The picturesqueness of this aspect, and the fact that the modern and irrelevant tracery of the east window is hidden by trees, suggested this point for a sketch. A sense of thankfulness is felt that the tower was left unfinished, and that its present proportions were not marred by the overloaded pinnacles and stepped embattling common in

pyramidal form in an otherwise somewhat monotonous vista. The original carved oak pulpit has been shockingly coloured within recent years. The font, south doors, and choir stalls are of the same date as the church—richly carved and interesting specimens of the period. Our illustration is from a sketch by John W. Rhodes.

AMONG the many public resorts of old New England few were better known or more frequented than the Red Horse Tavern of Sudbury, Mass., the famous Wayside Inn of Longfellow. Situated on the high road between Boston and towns to the southward, it was the resort of travellers of every rank and condition. The house is a large old-fashioned structure, with gambrel roof, huge chimneys, and square colonial porch at the entrance way. Entering the main door, we pass directly into the broad hall extending to the rear of the building. To the right is the long staircase leading to the hall above, at

hallway from the bar-room. It is a large, cheery room, yet dignified withal, a room where one can sit down solidly in a big old leather-bottomed chair, or recline on the arm of an elegantly made and delicately cushioned sofa of antique pattern. Opposite the front windows is the old fireplace, above which hangs the Howe coat of arms mentioned by Longfellow, and the window-panes on which Major Molineaux scratched his opinion concerning the quality of the drink sold at the Inn. It was around this now historic fireplace that Longfellow grouped the characters for his well-known poems.

SOME rare pictures adorn the walls of the famous Inn, and, indeed, the whole house is a veritable gallery of this sort. In the house are also many articles of historic interest, guns—and pistols of an ancient pattern, and swords which have done duty in old Indian wars, spinning-wheels, and irons, rare old furniture, and china,

Built about the year 1700, the Wayside Inn was the property of one David Howe, and according to Historian Hudson, of Sudbury, remained in the Howe family for a long term of years, passing successively through the hands of "Colonel Zeke," Adam, and "Squire Lyman, who was the bachelor landlord referred to by Longfellow in his tales. In the old days it was a flourishing house. Here in the long winter evenings gathered in the bar-room men of all conditions to exchange the news or discuss the politics of the day, the drover with slouch hat, long frock, and still longer whip, the farmer, the dandy, and the dignified squire, and many were the jests and mighty the long argument over a mug of home-brewed or a glass of Old Medford; or, again, the parlour and dining-rooms would be thronged with ladies and gentlemen in the evening dress of the period. Ladies with powdered hair and broad skirts, the gentlemen with knee breeches and swallow-tail coat, powdered wig and cocked hat, carried under the arm, while the walls of the old dance hall above re-echoed with the sound of moving feet gliding about the floor to the music of the old-time fiddler. Again in the long summer twilight, the seats under the old elms near the house would be filled with frequenters of the place, enjoying the cool evening air, laden with the perfume of the neighbouring fields, and filled with the sounds of lowing cattle and bleating flocks, voices of men, the chirp of frogs, or the distant cry of some belated bird. This is the Wayside Inn. Years have passed since its halls re-echoed with the song of the reveller, or the sound of the post-horn roused its inmates and announced the arrival of the morning stage. There it stands as in the olden time, but those who once thronged its halls now know it no more.

THE work of excavating the site of the Grey Friars Monastery within the grounds of Cardiff Castle, undertaken by the Marquess of Bute, and executed under the superintendence of Mr. C. B. Fowler, proceeds apace, and interesting discoveries have been made. Lord Bute has given orders for the removal of the whole of the accumulated earth, the dumpings of refuse by generations of Cardiffian scavengers, from the floor of the church of the monastery. At a depth of about 4ft. from the modern surface that floor was uncovered, and in the north aisle the stone foundation of a tomb was laid bare, with a portion of the stone plinth *in situ*. This tomb was found to contain the skeletons of two persons, and there is no doubt it is the burying-place of Sir William Flemming and Llewelyn Bren. Sir William Flemming was High Sheriff of Glamorgan in 1316, and Llewelyn Bren resided at Castell Coch, but held Caerphilly Castle in a military sense for the Earl de Clare. Edward II. sent an envoy to Glamorgan, and summoned Llewelyn to the presence of the King in London, giving him a guarantee of safety. Llewelyn went, and received a full pardon for his exploits, with 20,000 Welshmen, in knocking the Norman castles to pieces in all parts of the country. He returned to Cardiff with the King's pardon, but was apprehended by Sir William Flemming, who, with a fine disregard for the King's honour, hanged his prisoner in a building which stood between the present Royal Arcade and Great Frederick Street. When the news of the tragedy reached Edward II. he promptly signed the death-warrant of Sir William Flemming, and he was hanged on the spot where he had hung Llewelyn Bren. They were buried side by side, under a stone tomb, which was in existence about the year 1530. In addition to the tomb and its contents, there has been discovered at the Monastery the connecting passage between the church and the cloisters of the monastic buildings. Splendidly preserved arch-stones of the nave arcade have been unearthed, while on the south side several yards of the original floor have been laid bare, the joints of the tiles showing quite plainly, one of the tiles, representing the arms of England—three lions on a shield—being *in situ*. Several coins have been picked up, amongst them being a silver penny struck at York in the reign of Henry I. or II., a Dutch

coin of much later date, and an Abbey copper token of about the time of Henry V.

THERE is, after all, nothing like building land for money making—provided you have eyes capable of discerning the first tender green shoots of a good crop of that valuable plant known as unearned increment. Some five years ago a Cape Town gentleman named Moss, casting about him for an investment, was lucky enough to espy the financial possibilities of the barren sandy wastes known as the Cape Flats, lying between False and Table Bays. A good square block of these wastes he purchased for the modest sum of £600. Thanks to booming in Europe and troubles "up country," there has since been a remarkable gathering of population at Cape Town—of persons alike come "down" and going "up." The consequence is that property has gone up, and one item of Cape news to hand is that Mr. Moss's investment has just been valued at £30,000.

SOME months ago a considerable portion of the plaster on the north side of the tower of St. James' Church, Garlickhithe, was stripped off owing to the heat to which it was exposed by a fire on the opposite side of the street. Upon examination it was found that the original masonry of the tower remained practically intact, and that at some period the whole had been covered with plaster. The church tower stands at the western ending of the building in Garlick Hill. It contains three stories, the lowest containing a fine doorway, whilst the highest displays round headed windows with louvres. At the top are a cornice and a parapet, whilst above this, supported by a shallow dome, is a square lantern, which tapers to a ball and vane. The lower part of the lantern is ornamented with eight small columns, terminated with urns. The whole tower and steeple reaches to a height of 125ft. From the western face projects a clock, surrounded by a quaint old gilded figure of St. James. The present church and tower were rebuilt by Wren on the site of a former church, the foundation stone being laid in 1676, and the church opened in 1682. The total cost was upward of £5000. The plaster has been entirely stripped off the tower, and the masonry where necessary will be repaired. It is expected that the work of restoration will be finished in about six weeks time.

IN the course of the excavations which are being carried out at Furness Abbey, a bulla, or leaden seal, which must have come from Rome during the thirteenth century, was found in a perfect state of preservation at the south-western corner of the ruins, near where the great hall stood, and where the Bull to which it was attached was probably kept. It is almost circular in shape, about the size of a crown piece of the present day, but somewhat thicker. Five Bulls were received at the Cistercian establishment during the reign of Pope Innocent IV., and whilst William De Middleton was Abbot of Furness.

IT almost seems incredible that the official returns of the cost of our roads, just issued by the Local Government Board relate to the year 1894-95—in other words, they are two years old. Yet, being the latest issued, they are not devoid of interest. It appears from them that the expenditure of the highway authorities, excluding that defrayed out of loans, amounting during that year to £1,859,608. The loans raised by highway authorities during the year amounted to £12,995. The total rateable value of the highway districts and separate highway parishes was £52,416,358. The total amount of highway rates raised during the year—namely, £1,409,222—would be equivalent to an average charge of 6s. in the £ on this rateable value. The highway rates raised during the previous year were equal to an average charge of 6s. in the £ on the rateable value, in 1892-93 to 6s. 7d. in the £, in 1891-92 to 6s. 1d. in the £, in 1890-91 to 6s. in the £, and in 1889-90 to 6s. 4d. in the £. In 1888-89, the last year before the whole cost of the maintenance of main roads was

thrown on the County Councils by the Local Government Act, 1888, the average rate was 7s. 1d. The aggregate length of the roads under the supervision of Highway Boards and Surveyors of Highways in England and Wales, excluding 15,274 miles of main roads, the repairs of which had been undertaken by the County Councils themselves, was 104,258 miles, comprising 6262 miles of main roads, and 97,996 miles of ordinary highways. The number of miles of main roads repaired by the County Councils themselves, not included in the foregoing figures, was 5088 in 1889-90; 11,555 in 1890-91; 13,354 in 1891-92; 13,799 in 1892-93; 14,697 in 1893-94; and 15,274 in 1894-95.

DUMFRIES ACADEMY.

THE handsome buildings of the new Dumfries Academy, which have been in course of erection for more than a year, have now been completed. The Academy now forms one of the most handsome structures in the district, and it stands in the centre of a clear space, formed by the surrounding playground and the ornamental grounds in front. The site of the new buildings is the same as has been occupied by the Academy since the year 1802. The front of the new Academy is of an elaborate and ornate character. It is distinguished by an imposing portico, formed by a row of four massive Ionic columns, 30ft. in height, and 3ft. 6in. in diameter at the base, with corresponding pilasters on the face of the building, the columns being an exact copy of those in the Erechtheum, Athens. Surmounting the building is a heavy stone dome, supported by four winged lions set diagonally. Over all is a gilded figure symbolical of learning, cut in Indian teak, and 6ft. 6in. in height, the hand and the torch which it bears adding another 18in. Small panels under the windows of the upper floor bear symbolic sculpture, commerce being indicated by a Roman galley, weights, and balance; architecture, by a classical Ionic capital, a decorated Gothic window-head, and tracery; plenty, by a cornucopia, a sheaf of wheat, and a cluster of fruit; music, by Pan pipes and reeds; painting, by a laurel wreath, palette, and brushes; science, by the globe, retorts, and electrical apparatus; astronomy, by the telescopes, &c.; and justice, by the tablets of the law and two hands, each bearing a sword. The total frontage of the building is 132ft. and it extends back 112ft. The front entrance leads into the spacious central examination hall, from which direct access is gained to all the rooms. It is 60ft. in length by 45ft. wide, and with a height of 38ft. from floor to ceiling. The doors from the rooms on the upper floor open on to a gallery 6ft. wide, carried on steel cantilevers. The gas lighting of the hall is provided for by twelve handsome brass pendants of special design, each with a dozen jets, and by several wall brackets. The science rooms are to the front, and comprise a lecture theatre 34ft. by 24ft., having accommodation for 80 students; a laboratory, 30ft. 6in. by 22ft.; and a preparation room. The Art department comprises a drawing-master's room, measuring 17ft. by 13ft.; an elementary drawing room, 33ft. by 22ft.; a cast or antique room, 30ft. by 22ft.; with model dressing-room attached. A square block in the rear of the main building contains the technical workshops and the gymnasium. The gymnasium is 45ft. long by 20ft. wide, and 22ft. in height. It is fitted up with a complete set of apparatus for physical exercises, and fencing, Indian club exercises, &c., will be taught by Pipe-Major Anceel, the drill instructor. There are two workshops—one for instruction in carpentry, and the other for instruction in metal work. The total cost of the buildings, excluding the gas fittings contract, and one or two other items, is put at £13,628; and to this sum also there falls to be added the architect's (Mr. F. C. J. Carruthers) fees, and the charges for clerk of works and measurers. But there are already signs that the undertaking is to meet with entire success. The formality of declaring the building open was performed by Sir Robert Reid, Q.C., M.P., a few days ago.

Surveying and Sanitary SUPPLEMENT.

SEPTEMBER 29TH, 1897.

The Sanitary Congress at Leeds.

(BY A SPECIAL CORRESPONDENT.)

THE various proceedings of the Sanitary Congress proper have been reported at unusual length in the daily press, and do not consequently need detailed repetition in these pages; but there are one or two points which may perhaps be discussed with advantage. On the opening day of the Congress a point debated by several speakers was the question as to whether, by the present preservation of sickly lives, we are not even propagating a sickening race of people. Another interesting portion of the President's address was that which refers to the "monotony of Labour," which he claims is greatly contributed to by the attempts of certain sections of the people to enforce the condition "for each workman to be paid the same wage whether he work well or ill, whether he be clever or stupid, skilful or clumsy, industrious or idle," and this he claims acts injuriously on the individual because it takes away one of the most potent stimulants in life. The President also contended that no properly instructed person in these enlightened days would dream of taking a house without a thorough inspection of and report on its sanitary arrangements. Whilst agreeing with the wisdom of these precautions, I must confess that I still know of a number of improperly instructed persons now going about. Later on, Dr. Farquharson quoted from one of Dr. Corfield's works, which rather confirms my views. The Professor says: "Sometimes the members of a family in a country-house have found that, so far from getting refreshed and invigorated by their visit to the country, they have always felt depressed and weakened and generally out of sorts during their stay there, more especially those members of the family that spend most of their time inside the house." The question of river pollution, discussed on the second day, is one especially important to Leeds. To many persons who are more than tyros on this question, the finding of a practicable remedy for the

POLLUTION OF THE RIVER AIRE, and similarly-polluted streams, appears to be hopeless. Major Flower, in his opening address on the subject, maintained that there was not a single trade pollution for which there was not a remedy, and that if these remedies were used the treatment of sewage would be greatly facilitated. On Wednesday and Thursday, in the Methodist Hall, Woodhouse Lane, a ladies' conference, on "Domestic Hygiene," was held. The employment of

ladies as gardeners and sanitary inspectors was strongly advocated, and it was stated, in reference to the former, that nearly one hundred women had passed through a special training at the Swanley Horticultural College, and that most of these had afterwards obtained employment either as gardeners or teachers in public institutions. Amongst other interesting papers in this section were those entitled "Women as Teachers of Hygiene," and "Health in Infant Schools." During the week excursions were made to the works of the Leeds Fireclay Company, Wortley; to Burmantofts, the Meanwood Road Destructor, the Sewage Works at Knostrop, the Electric Generating Station at Crown Point, the Farnley Iron Company's Works, Black Dike Mills, the Shildon Head Brewery, and the Queensbury Sewage Works; whilst the Union Street Baths, the New Medical School, and the Yorkshire College were all visited by large deputations from the Congress. Many other large manufacturers of the city, in addition to those above-mentioned, made arrangements for their works and factories to be accessible to such members as desired to inspect them, and it is needless to say that this concession was made use of by a large number of the more scientifically inclined. On Friday night probably, in order that the citizens should not feel themselves neglected by their visitors, Dr. Brobbyer, Medical Officer of Health of Nottingham, delivered a "popular" lecture on "Some Essentials of Popular Hygiene." The many subjects he touched upon principally had bearing upon domestic and dietetic matters. After an exceptionally heavy programme the Congress was brought to a close by a general meeting of the members in the council chamber of the Town Hall on Friday night, when the President (Dr. Farquharson) presided. The arrangements during the week for the entertainment of the members were well worthy of the reputation held by Yorkshire for hospitality. Consideration of the objects and aims of the Sanitary Institute and its kindred bodies, as set forth in the papers in the most varied subjects that were read at the Congress during the past week, enables one to partially realise the vast extent of ground now covered by modern hygiene, or as it is now, more often termed "Preventive Medicine." This partial realisation of its scope, however, causes me to re-echo the suggestion made by the President of the Congress in his inaugural address, that the time is now ripe for the constitution of

A SEPARATE DEPARTMENT OF STATE, to be known as the Board of Health, and the first duties of this Board should be the proper co-ordination into one harmonious whole of the present very scattered threads of sanitary legislation, and the sifting of the wheat out of the chaff from the many ideal suggestions in

connection with hygienic matters with which we are now well-nigh overwhelmed. Great thanks for the wonderful development of sanitation, and also for the partial education of the public in the many-sided subjects connected therewith, is honestly due to the council and management of the Sanitary Institute, and with this in mind I cannot refrain from saying that it would afford members the greatest satisfaction to learn that there is even some probability of this body changing its present home for a more imposing edifice than it at present possesses, and which certainly is hardly worthy of the present exalted status accorded to the Institute in its sanitary mission by most authorities at home and abroad.

THE HEALTH EXHIBITION.

It is part of the province of the Sanitary Institute not only to promote the advancement of sanitary science through lectures, examinations, a journal, museum, and library provided for its members, but to diffuse knowledge by means of what is aptly termed a Health Exhibition. In this way the general public are first interested, and then instructed. The present Exhibition, which will be continued until October 9, must prove of a high educational value. Even those who are the least informed on such matters should be able, almost at a glance, to learn something useful concerning the progress effected in sanitary engineering during the past half century. The biggest and best-known firms are represented by specimens of the most modern invention, and in many instances appliances are shown in actual operation. For the housing of the various exhibits a temporary structure has been erected on the Engineer Volunteers' drill-ground in Camp Road. Of the four sections into which the undertaking is divided, probably none attracted more attention than that devoted to the science of sanitation pure and simple. In this category may be mentioned a commodious lecture-room at the right-hand top corner of the building, where demonstrations with the aid of a magic lantern and other apparatus were given. Most striking of all is a model hospital, situated immediately on the right of the entrance. This is a corrugated iron edifice, measuring some 70ft. in length by 25ft. in width, partitioned into three lofty rooms, each of which is lined with match-boards and felt, and ventilated upon

THE MOST IMPROVED PRINCIPLES.

One of the rooms partakes of the nature of a hospital ward. It accommodates five Lawson-Tait beds of various kinds, properly fitted up. The general exhibits are displayed upon nearly 150 stands, and, in addition to these,

a number of articles on loan and not for competition may be noticed. Of special interest to municipalities and local authorities is the department known as "Section B." The most recent thing in ash-pits, for example, comes under this head, and the several methods of sewage treatment are an important feature. Models and diagrams of the latter are shown, together with specimens of effluents analytically and chemically treated. A considerable amount of space is taken up by exhibitors of bulky plumbers' material and ware for drainage and sewerage purposes. Sewage lifts are some of the contrivances to be seen at work. One of them, in model form, is the Shone pneumatic ejector, designed to lift sewage automatically from a low level, and thus to enable engineers to be independent of levels altogether, no matter what country they are called upon to work in. The Defries filters for waterworks are also notable objects, and the same people are exhibiting an apparatus for sterilising linen fouled by disease. Earth closets, enamelled lavatory and bath ware, flush tanks, hospital sinks, railway sanitary appliances, lead and art metal work, a patent air purifying screen, heating and ventilating methods, chemical exhibits, gas engines, laundry appliances, ambulance vehicles, systems of disinfecting and concoctions of all kinds for use therein, are some of the many other things to be shown. The subject of domestic economy is also remembered. Improved fireplaces and a variety of articles, whose virtue is the bettering of conditions in the home, have not failed to attract scrutiny. The exhibitors assure us that good business is being done, and that, from their point of view, Newcastle, the scene of last year's Exhibition, does not approach Leeds. It must be admitted that the Leeds firms have done well at the Exhibition.

MESSRS. ADAMS AND CO.

in particular have contributed a fine exhibit, not for competition, of their sanitary fittings, closets, and flushing apparatus. Messrs. Adams show also their patent sewage lift, far reaching, whilst a closet of a character suited to Oriental requirements and customs indicates how widespread and far reaching are the operations of the firm. A much appreciated boon is the provision by this firm of the gentlemen's lavatory.

MESSRS. AMES AND CRASTA,

of Nottingham, show their patent reliable self-adjusting pipe-joint, as well as a variety of improved manhole covers, capable of being used either as ventilating or closed covers by a very simple but most effective device.

THE PATENT GULLY COMPANY LTD., also of Nottingham, has been awarded a bronze medal for Crasta's patent surface-water gullies, a contrivance by which deleterious matter can pass into the sewers from the street gullies.

MESSRS. SHANKS AND CO.,

of Barrhead, have the largest show in the Exhibition, and have provided a good object lesson by showing some of the earliest forms of what has become, in its final evolution (if, indeed, it be yet final), their almost perfect "Barrhead syphonic closet." This firm's "Fin de Siècle" bath has won a silver medal, and certainly it is a most temptingly luxurious article, complete in every possible requirement.

MESSRS. DOULTON

are near neighbours of Messrs. Shanks, and very notable neighbours too. Their new "Ellison's Patent O.B. Closet" is to be specially tried, and is marked accordingly "Deferred for practical trial." This firm supply the ladies' lavatory at the Exhibition.

THE BLACKMAN VENTILATING COMPANY LIMITED

has its fans shown at Stand 112, and receives no small amount of attention, which is not remarkable in these days of ventilating systems.

THE LEEDS FIRECLAY COMPANY LTD. has a fine display of the goods produced by the six old-established firms whose amalgamation formed the Company. Baths and lavatory

fittings figure prominently, and a very imposing effect is made by a group of Burmantoft's vases and wall decorations in Burmantoft's faience, for which a silver medal was given. Glazed bricks, tiles, grease-traps, drain pipes, pipe-joints, testify to the wide field covered by the operations of the Company as fireclay workers. It may also be noted that the Company owns and works its own mines of fireclay, both in Leeds and elsewhere. The Company receives no less than six bronze medals, besides the silver medal already referred to.

THE FARNLEY IRON COMPANY LTD.

has a stand showing its sanitary ware, and the famous Farnley glazed bricks, the reputation of which is American as well as British, the bricks being employed in some of the New York "sky-scrapers." Bronze medals were awarded to the Company for white and coloured glazed bricks, and for enamelled bath and fireclay sinks.

MESSRS. DUCKETT AND SONS

exhibit their latrines, automatic flushing tanks, closets, &c., and a variety of sanitary appliances in brown glazed ware.

MESSRS. CAMERON, COMMINS, AND MARTIN,

of Exeter, have a model at Stand 12, showing the working of a septic tank system of sewage treatment. Samples of treated sewage and diagrams assist the investigator, and it is certain that the inventors have used their space to the best possible advantage in providing this practical demonstration of their system.

MESSRS. SISSONS BROS. AND CO. LTD.

of Hull, exhibit Hall's sanitary washable distemper, a new patent water paint. One of the features of this new paint is specially noteworthy: it is claimed that white ceilings coated with it will not turn black with sulphur, as it contains no lead, and will never crack or fall off. When we add that it destroys vermin, it is evident that the article has a great future before it.

MESSRS. HALL AND BOARDMAN

represent the staple industry of Swadlincote, with a variety of sanitary ware; upon which is placed the intimation that the goods are ordinary stock, and are not made specially for exhibition purposes. The principle is as creditable to the firm as the goods to which it is applied.

DAY'S AUTOMATIC WASTE WATER CLOSET COMPANY,

of Wolverhampton, shows its speciality, the "Stafford closet," which has been adopted by the Stafford Corporation.

LIST OF AWARDS.

The following is a complete list of awards that have been made by the judges:—

SILVER MEDALS.—Blackman Ventilating Co. Ltd., 63, Fore Street, E.C., for coke screen for ventilating purposes; Cadbury Bros., Bournville, Birmingham, cocoa; F. C. Calvert and Co., Bradford, Manchester, pure carbolic acid; Davis Gas Stove Co. Ltd., 200, Camberwell Road, S.E., "Metropolitan" gas cooker; J. Defries and Sons Ltd., 147, Houndsditch, E.C., Pasteur-Chamberland domestic filter, and also for portable hot spray disinfectant; Expanded Metal Co. Ltd., 39, Upper Thames Street, E.C., expanded metal; the Ferrybridge Foundry Co., Ferrybridge, Yorkshire, Fryston duplex fire kitchener; J. S. Fry and Sons Ltd., Bristol, cocoa; Hughes and Lancaster, 47, Victoria Street, S.W., Shone's hydro-pneumatic ejector; Jas. Milne and Son Ltd., 48, Wellington Street, Leeds, "Instantan" grip fire hose connection; Leeds Fireclay Co. Ltd., Leeds, wall decorations in Burmantoft's faience; Reynolds and Branson, 14, Commercial Street, Leeds, apparatus for analysis of air, water, food, &c.; Shanks and Co., Barrhead, N.B., "Fin de Siècle" bath.

BRONZE MEDALS.—Cannon Hallow Ware Co., Deepfields, near Bilston, Staffordshire, enamelled cast-iron, and also for Hercules gas

cooker; the Cordelova Co. Ltd., 74, Pitt Street, Edinburgh, Cordelova wall coverings; Cloughton Brothers, Bramley, Leeds, the "Niagara" water-waste preventor; S. Dixon and Son, 31 to 41, Swinegate, Leeds, incandescent arc outside lamp; Alfred Dougill and Co. Ltd., 36, Great George Street, Leeds, gas engine convertible into oil engine; Jas. Duckett and Sons Ltd., Sanitary Ware Works, Burnley, Lancashire, "Clencher" washdown closet; Farnley Iron Co., Farnley Works, Leeds, white and coloured glazed bricks, and also for white enamelled fireclay bath without fittings, and white enamelled fireclay sinks without fittings; Ferrybridge Foundry Co., Ferrybridge, Yorkshire, Fryston lifting fire kitchener; William Gooding, North Road Works, Metropolitan Cattle Market, Islington, N., combined safety valve and fusible plug, and also for interchangeable rubber stair treads; Henry Jackson, 134, Westfield Road, Leeds, self-feeding circulating boiler; John Jones, 40, Sydney Street, Chelsea, S.W., releasable stopper for cleaning arm of disconnecting trap; Leeds Art Pottery and Tile Co., Leathley Road, Hunslet, Leeds, faience tile dados; Leeds Fireclay Co. Ltd., Leeds, glazed bricks, and also for Shoppee's dovetail bricks, Tiltman's division bricks, vitreous glazed terra cotta, white enamelled fireclay bath without fittings, and white enamelled fireclay sink without fittings; Richard Mason, Hemsworth, near Wakefield, reversible window and fanlight; Mellin's Food Ltd., Marlborough Works, Stafford Street, Peckham, London, S.E., Mellin's food for invalids; Jas. Milne and Son Ltd., 48, Wellington Street, Leeds, sink waste fittings, and also for upright combination bath fittings, with large outlets; New Patent Broom Co., Paragon Works, Stoke Newington, London, N., Paragon bass brooms; Noble, Brown, and Co., Nobro Works, Firth Street, Leeds, Nobro portable fire pump; Patent Gully Co. Ltd., St. Peter's Church Walk, Nottingham, Crosta's iron road gullies; Price's Patent Candle Co. Ltd., Belmont Works, Battersea, London, S.W., pure glycerine; R. H. Quine, 1, Leaf Square, Pendleton, Manchester, sanitary ashbin; John Russell and Co. Ltd., 15, Wellington Street, Leeds, wrought iron and steel tubes, and also for cup fittings for incandescent gas lamps; Teal and Somers, Leeds, raised hearth and sunk fire; Vimbos Ltd., 13c, Queen Victoria Street, London, E.C., Vimbos fluid beef; E. Walker and Co., Heckmondwike, Yorkshire, Walker's block tin lined iron pipe; Whiteley Exerciser Ltd., 21 and 22, Laurence Pountney Lane, Cannon Street, E.C., health exerciser; Wilson and Stockall, Bury, Lancashire, accident ambulance carriage.

DEFERRED FOR PRACTICAL TRIAL.—Cameron, Commins, and Martin, 7, Bedford Circus, Exeter, for septic tank system of sewage treatment; R. Clark and Co., Milton Works, Heckmondwike, "Eureka" lead incased block tin water pipe; Abraham Thomas Cooper, 92, Moray Road, London, N., Cooper's suction and vacuum pump; Davis Gas Stove Co. Ltd., 200, Camberwell Road, S.E., open ventilating gas fire; Alfred Dougill and Co. Ltd., 36, Great George Street, Leeds, Tornado air propeller; Doulton and Co., Lambeth, S.E., "Ellison's" O.B. closet; Formalin Hygienic Co., 9 and 10, St. Mary-at-Hill, London, E.C., "The Alformant"; Formalin Hygienic Co., 9 and 10, St. Mary-at-Hill, London, E.C., "Formalin"; Hughes and Lancaster, 47, Victoria Street, S.W., Fischer stone filters; Irving, Son, and Jones, 23, Blackstock Street, Liverpool, Manhu Gluten flour; George Jennings, Lambeth Palace Road, S.E., Duplex supply and sanitary waste valves for lavatories; George Jennings, Lambeth Palace Road, S.E., Duplex supply and sanitary waste valves for baths; Jeyes' Sanitary Compounds Co. Ltd., 64, Cannon Street, E.C., formogenic auto-clave; John Jones, 40, Sydney Street, Chelsea, London, S.W., automatic flushing cistern for urinals; John Jones, 40, Sydney Street, Chelsea, London, S.W., ball valves; B. Kuhn, 36, St. Mary-at-Hill, London, E.C., "Chinosol"; Manchester Gas Cooker Ltd., Albert Works, Huddersfield, gas governor; Richmond and Co. Ltd., Warrington, Gulf Stream geyser; Sissons Bros. and Co. Ltd., Sculcoats, Hull, sanitary washable distemper; J. Stott

and Co., Vernon Works, Oldham, electric motor dynamo; Torpedo Ventilator Co., 32, Eyre Street, Sheffield, torpedo ventilators; United Alkali Co., Exchange Buildings, Liverpool, hypochlorite of soda solution; Valveless Syphon Co., Kirkstall, Leeds, Waterwitch ball valves; E. Walker and Co., Heckmondwike, Walker's aluminium-lined pipes; E. Walker and Co., Heckmondwike, frost-resisting pipes; Washington Lyon, 85, Asylum Road, Peckham, S.E., steam disinfectant.

LETTERS OF THANKS OR RECOGNITION.—Adams and Co., Park Lane Works, Leeds, gentlemen's lavatory; Blind Institution, Leeds, baskets and brushes; British Institute of Preventive Medicine, 74, Great Russell Street, London, S.W., cultivation of bacteria; Cloughton Bros., Bramley, Leeds, ornamental lead work; Doulton and Co., Lambeth, London, S.E., ladies' lavatory; Reynolds and Branson, 14, Commercial Street, Leeds, exhibit of models, diagrams, lantern slides, and apparatus in relation to physiology; Shanks and Co., Tubal Works, Barrhead, N.B., specimens of old defective work.

THE sewage outfall at Fisher's Nose is approaching completion, and Plymouth will shortly be able to congratulate itself upon the fact that one portion of its drainage scheme is finished. It will not be a day to soon. Where the sewage is now discharged we do not know, but certainly the whole neighbourhood of the Barbican, from the new Fish Market to Phoenix Wharf, is permeated by most offensive odours, while at low tide the water in the vicinity of the wharf appears to be little better than sewage. People who live in the neighbourhood or carry on business there must have got pretty well inured to the dreadful smells, or they would long since have risen in protest against the nuisance. We wish them a happy issue out of the infliction.

Surveying and Sanitary Notes.

MR. STOTT, Medical Officer of Health, has prepared an interesting report on a new system of dealing with sewage which has been started at Exeter. The Hayward's Heath Council has commissioned Mr. Baldwin Latham to report on the best way to deal with the sewage of Hayward's Heath, and in the meantime had asked Dr. Stott for his opinion on the Septic system, in which microbes perform a very important part. The value of the system, from the Hayward's Heath point of view, was the small area of ground required for the works. Mr. Stott would not recommend the Exeter system, it being in an experimental stage, and was seemingly more inclined to favour the systems in use at Friern Barnet and Sutton, where the microbes were permitted to do their work in the open rather than in the closed chamber, as in the Exeter system. A pointed question was put to the Medical Officer as to how near houses could be built to the microbe "industrial home." The answer was to the effect that houses were quite close, and Mr. Stott made the astonishing statement that near a sewage farm there was more ozone than at Brighton.

THE Collector of Poona recently appointed Surgeon-Major Barry to investigate the sanitary condition of the city of Poona, and a very long report from that officer has now been published. It discloses an extraordinary condition of affairs. It opens by stating that under its present municipality the city has fallen "into the groove of chaos, of incompetence, inefficiency, waste, absence of check, and wanton disregard of public obligations

towards the poorer class of citizens." Dr. Barry deals with his subject under fourteen heads; but only very few of these can be mentioned here. The night soil has to be removed in carts through public thoroughfares over three miles from the city to the poudrette factory, and it is therefore "important that the carts should be in first-class working order, not liable to break down, outwardly clean, and with valve fittings calculated to stop effluvia." Dr. Barry examined the carts in every single depot, and called in the collector to witness the accuracy of his statements. He found that not one cart was in working order, and he mentions cases where full carts have broken down in the streets and been allowed to remain for days without removal. Owing to neglect in emptying cesspools and other neglects, which Dr. Barry mentions in detail, he describes Poona as lying on a bed of sewage; the surface gutters are a mere device to hide filth; rubbish was not removed, and it was a common occurrence to find the dustbins overflowing and surrounded by a rampart of filth which was not removed for four or five days together; the number of dustbins was not half what it should be; all the open places of the city were laid out in filth; the back lanes seem to have never been inspected. The wealthy quarters are nearly as bad as the poor ones. "A walk down Sadashiv Peth, our local Belgravia, is a liberal education in Oriental hygiene—light minus sweetness;" and he describes some of the abominations amongst which wealthy and influential natives seem content to live. He mentions that he has seen the city engineer's men seeking for an obstruction by digging up the public thoroughfares, and not merely failing to find the obstruction, but failing to hit on the drain at all! Indeed, both the health officer and the engineer of the municipality fare very badly at Dr. Barry's hands.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
Oct. 1	Redditch, Wales—Police Station Buildings	County Council	County Surveyor, Pierpoint-street, Worcester.
" 1	Arklow, Ireland—Residence and Dispensary	Guardians of Rathdrum Union	R. Howard, J.P., Main-street, Arklow.
" 1	Rathdrum, Ireland—Boarding Floor	Guardians	B. Manning, Clerk, Board-room, Workhouse.

Practical Carpentry and Joinery.

(Continued from page 124.)

By GEO. ELLIS.

EXCAVATIONS for drains, foundations, &c., require strutting to prevent the sides falling in upon the workmen. The arrangement of struts, &c., used for this purpose is called the "timbering." The form of this timbering varies according to the nature of the soil and the size of the cutting. For a good firm soil, the arrange-

FIG. 15. TRENCH IN GOOD GROUND.

ment shown in Fig. 15 is adopted. When the ground has been taken out to a depth of 4ft., pairs of poling boards, 2in. by 7in., and of suitable length, are placed at the sides at intervals of 6ft. or 8ft., and strutted apart with short fir poles driven tightly between them. This process is repeated until the trench is opened to the required depth, when longer poling boards are substituted for those first used. At every 5ft. or so in depth, a stage of scaffold boards is laid on the struts, upon which the earth is thrown by successive gangs of men till it reaches the top, where it is banked on either side till required for refilling the trench.

In looser soils, thinner poling boards are placed side by side, and crossed at their centres by horizontal timbers, called "walings," which are strutted as shown in Fig. 16. In bad ground, where the sides will not stand long enough to allow of a depth sufficient for the use of poling boards, to be excavated, the ground is taken out to a depth of 9in. or 1ft.,

FIG. 16. TRENCH IN LOOSE GROUND.

and 1 $\frac{1}{2}$ in. by 9in. boards, called sheeting, are laid longitudinally at each side of the trench and strutted, then a similar depth is taken out and another pair of boards inserted and fixed. When these reach a depth of 3ft., vertical waling pieces are laid against them and strutted in their turn, the other struts being then knocked away (see Fig. 17). It is also advisable to make the sides of the trench taper slightly towards the bottom in case of any shrinkage of the soil and subsidence of the timber; the struts will have a tendency to tighten up. Where deep excavations have to be made in water-logged ground, or where the strata is inclined, i.e., not at right angles to the weight it has to carry, a heavier form of timbering is used (see Fig. 18). The trench is lined closely with 3in. by 11in. deals, about 8ft. long, called runners, kept in position by stout walings and die square struts. The ground is opened as deep as consistent with safety, the walings inserted and fixed against guide pieces, the runners with their ends sharpened, so as to drive away from the trench, are then entered behind them, and driven in as far as possible. The earth between them is then removed and the runners again driven down, the process being repeated till the ends of the runners are flush with the top of cutting, when another tier is commenced, just within the first. As this continuously reduces the size of the trench, due allowance must be made for it at commencement.

It should be observed in timbering trenches that the timber must be driven tightly against the sides, to prevent any movement of the soil, but not with sufficient force to disturb it. The

FIG. 17. INCLINED TRENCH IN BAD GROUND.

struts should be of not less than 4in. diameter, increasing in size with the depth of the excavation. Immense and unexpected strains are sometimes thrown on the timbers in deep cuttings, and it is very dangerous to use small timbers. Struts small in diameter, in proportion to the width of the walings, will often cause the latter to split.

TUNNELLING.—The method of timbering a tunnel in good ground is shown in Fig. 19. The process is usually carried out as follows: The excavator removes about 3ft. of earth, making the hole about 6ft. high and 4ft. wide at the bottom, and 3ft. at top. Poling boards are then driven in at the top and held up by a head-piece and two side posts, the lower end of these posts being sunk in the ground a few inches to prevent them slipping. When two of these frames have been erected poling boards are driven behind them to line the sides, and a further portion of earth is taken out from the top. Another row of poling boards is driven in, overlapping the first driven, and the next

FIG. 18. TIMBERING FOR DEEP CUTTING IN BAD GROUND.

frame erected secures both sets. This process is repeated throughout the tunnel. Fig. 20 shows the method adopted in bad ground. The sides and top of the tunnel are close-lined with poling boards, kept in position by the frame of square timber; inside this is constructed a frame of stout round timber, the sides being notched into the head and sill. Blocks or folding wedges are then driven between the frames to set the work up securely.

(To be continued.)

LONDON'S REFUSE.

HOW IT IS DISPOSED OF.

COMPARATIVELY few who cross Waterloo Bridge are aware that within a stone's throw to the east, on the Surrey side, lies the splendidly-organized and fully-equipped Dust Yard of the City Commissioners of Sewers. In its way it may fairly claim to rank among the most interesting of the unfamiliar sights of the metropolis. Since 1877 the yard has been an existent fact, and though occasional novelties in combustion systems or smoke consumption may be tried, it has succeeded in developing to keep pace with the growth of London without much alteration or enlargement. In extent it covers about five acres, and with its frontage to the river and free currents of air, there is neither smell nor unpleasant "fluff" about the place, even upon a close and stuffy September afternoon. Some general figures. As to the

MAGNITUDE OF THE OPERATIONS

undertaken by the yard, it should be explained at the outset (says the Daily Graphic) that it deals with something like 200 tons of refuse daily, or 238,000 van loads in the course of the year. In summer time the work is far lighter than in winter, when fires are general and rain is continually adding to the mud of the streets. The scavengings of these latter are kept totally distinct from those of dwelling houses and shops, and each is dealt with upon a fixed system. The wage list includes about 700 men, women, and boys, and sub-contracting of any sort was abolished by the Corporation a few years ago. The result is that in wages and hours the workers are far better off than they are in the yards of private contractors. About ninety-five horses are required for the work, which may be said to be unending. For,

FIG. 19. TUNNELLING IN GOOD GROUND.

FIG. 20. TUNNELLING IN BAD GROUND.

with the exception of a few hours on Sunday, the heavy carts with their gilt lettering of "City Sewers" are continually passing day and night from the civic area to Lambeth. As soon as a van-load arrives its contents are shot on to an already huge heap, which it would seem could never be cleared up into anything that could be classified. The scene is a curiously picturesque one, and it is strange that with its bustling movement and bizarre colouring it has not received more artistic notice. Across the river stands Somerset House, always stately in its grey length and height, and across Waterloo Bridge an unending procession of the tops of vehicles and tall hats are to be seen. On the Surrey shore lie some heavy low-built Thames barges, with a glimpse of their rigging and furled orange sails to fill in a background for the picture, while the vast pile itself is an

ODD MOSAIC OF BLACK AND WHITE,

with sharper notes of green and yellow, blue and violet thrown in; for an enormous proportion of the rubbish brought in consists of paper—letters scarcely torn across, newspapers, whole or in fragments, brown paper wrappings, tissue paper packing, and now and again the cover of a cardboard box or some piece of gay wall-paper appears in the mass. The paper that is clean enough to be saleable alone amounts to a hundred tons a month, or twelve hundred tons a year, while quantities are too dirty or in too small fragments to be worth saving. The work of sorting is done by the men and women together, the former doing the heavier work of loosening the heap with their forks and carrying away the baskets as they fill up with one or other form of apparently worthless stuff, the latter throwing tins or string, rags, corks, bottles, or anything of even the most infinitesimal commercial value into separate receptacles. But this does not represent the ultimate possibilities of searching out, for a great proportion of the rubbish is sifted through fine sieves, and any small properties of the slightest use are at once detected. This part of the work is also done by men and women together, the women standing behind large heaps of the dust and shaking the material through as it is pitched to them in shovels by the men. Some five or six were employed in this department on the day that I visited it, and among them were one or two girls of the true South London factory type with heavy fringes and large gilt earrings. But the feather hats were spared the destructive influences of the work, and each wore swathed round her head in turban fashion the more becoming headdress of a gaily coloured pocket handkerchief.

THE FURNACES.

But, after careful separation, there exists a huge proportion of material that has neither direct use nor saleable worth. Of this a quantity, averaging ninety van-loads a day, or a little more than a load per quarter hour, is destroyed in the vast series of furnaces which occupy one great shed. The *débris* is

conveyed to the upper floor, where it lies in stacks, and is passed down to the blazing chambers below, where the heat is intense enough to fuse stoneware bottles, scraps of paper, bits of metal, and a thousand and one miscellaneous substances into a coke-like looking production technically known as "hard core," and much used for the foundation of roads or asphalted tracks. Our guides had one of these furnaces opened for us, and the heat of the glowing contents caused us to move some paces back, while from a fragment of glass near the grating beneath were falling through molten drops, which cooled into threads of silk-like fineness. Compared with the wages paid for other forms of unskilled labour, and with those offered either by

PRIVATE OR SUB-CONTRACTING FIRMS,

the Corporation deals generously with its hands. The women especially are well treated, for their wages run from 12s. to 14s. a week, the higher figure being paid to the majority of the eighty to ninety employed. For both men and women are large and comfortable separate rooms for meals, and each is provided with a big fireplace for the warming of food, or the making of tea; while in the winter, when the dustmen must go their rounds alike in rain or shine, a drying room heated by hot-air pipes is an immense boon for them to dry their wet coats. "Finds," of course, are numerous upon the heaps, and many articles of great value have been restored to their owners from the yard. On one occasion some bonds, representing many thousands of pounds, were discovered, and cheques frequently turn up—very often, too, merely payable "to bearer." On the whole the workpeople are exceedingly honest, though the work develops their acuteness of sight for a coin or stamps to an almost incredible degree. The superintendent of the yard assured me he had frequently been watching as he thought most keenly for something of value to appear, and saw nothing, while a practised eye would detect and bring out apparently from under a heap a threepenny piece, or an even less visible halfpenny. A reward is, of course, given for anything found of worth, but only a short time since an extremely good pair of opera glasses were discovered by a man, who secreted them and took them to a pawnbroker's near by. The pawnbroker suspected that something was not quite right about them, and detained the man, who was convicted and lost his situation, as a kind of object-lesson to others to abide by the rules of the yard. The corpses of babies have on two occasions been found in the yard, among the more gruesome items of its rarer finds. A walk through the City dustyard is a most instructive lesson in the economy of production, for absolutely nothing is wasted. Even what is so worthless that it is only burnt, comes out in the form of "hardcore," a cheap road metal, and the fine dust that passes through the sieves contributes a useful item to brickmaking. Rags, of course, find their way to the paper makers, as

do the 1200 tons of waste paper which are at the disposal of the Commissioners during the year. This, as a rule, is re-made into cardboard or the thicker kinds of brown paper used in packing, and is sent out from the yard in neatly-shaped and wrapped-up bales of about two hundredweight each. Corks are among the most attentively sought-for treasures, and are carefully sorted out according to size, as the larger ones from wine bottles can generally be cleaned and cut down so as to serve for smaller bottles, while the tiny ones or those too much damaged for any use as stoppers are much in demand by the makers of inexpensive lifebelts, for which there is a good market. Another commodity of which the authorities never have more than they can dispose of is string, which contributes the basis of the best and toughest of foreign notepaper. Enormous quantities of this, both in long and short lengths, are found, but no scrap of it in any quality or thickness is passed over. Old iron, scraps of indiarubber, fragments of braid, broken furniture, and quantities of empty reels, are all saleable again, and there were several baskets filled with old brushes—from carpet sweepers to bonnet whisks—which had not ended their work yet in the world.

THE STABLES.

The Corporation is proud of its horses, and the stables of the yard is one of its best sights. They average £80 a piece in value, and represent the best type of the English Shire horse. Most of them stand over seventeen hands in height, and are capable of doing three or four journeys a day. The inspector of the yard was careful to point out that no bearing reins are allowed, and experience had shown the wisdom of abolishing this unnecessary and cruel addition to the gear of a draught horse by the comfort and sureness of foot that the animals evince under the most trying conditions of slippery wood and asphalt upon the ups and downs of the City streets. Another stringent rule upon the drivers is that they shall not trot their horses. The stables are high, light, and airy, and the stalls roomy and comfortable, with abundant supplies of peat moss for litter. The yard has its own farriers' shed, and the greater part of the substantial-looking harness, with its repeated "C.C.S." in brightly-burnished brass, is also made upon the premises. Our tour of inspection was not complete until we had been to the wharf side to see the barges in which

THE STREET SWEEPINGS

were conveyed away. These sweepings possess a market value for manure, and large farmers and wholesale vegetable growers are the customers. The sweepings are mixed with a certain proportion of other refuse, and the whole is disposed of at a low price. Some nine barge loads of about seventy tons apiece represent the average output of the week. As we saw one of these barges lying alongside it was an idyllic little scene of river life. There was the husband, a strong, muscular fellow, perhaps six feet tall, putting the last shovelful of his not too savoury cargo on board. At the stern sat his wife, with the tea things comfortably set out, and filling her interval of waiting by knitting as patiently and quietly as any German *Hausfrau*; while their little girl, a delightful, golden-haired mite of about three years old, in a vivid scarlet pinafore, was giving a lesson in manners to an obstreperous dolly. Near by lay another barge loaded high with straw for delivery at the wharf, it being usual to take the opportunity when sending a barge to bring back manure, of forwarding up by it a load of straw or hay. Even at this point, where less than in any other part of the yard can precautions be taken to mitigate mal-odourousness, was there the slightest smell, and the gentle breeze across the river dispersed every element of offence. But it would not be fair to put into comparison all dust-yards with that of the City. At Letts's Wharf, however, where the rule obtains of fifty-three hours work a week, the conditions are made as tolerable and even pleasant as it is possible that the humble vocation of the *chiffonnier* can ever hope to become.

Professional Items.

ABERDEEN.—For some weeks past Ferryhill Free Church has been undergoing alterations. Additional sitting accommodation has been becoming needful, and this has now been provided in an extension of the gallery. Roomy side galleries have now been inserted, running from the end gallery along each wall and into the transepts on each side of the pulpit. The woodwork is of the rich pine of which the other furnishings were constructed, and is specially beautiful in the gallery front, which is of a decorative character, prominent quatrefoil panels being the central design, round which the rest of the moulding and panelling is worked. Then the internal walls, including the walls of the vestibules and staircases, have undergone treatment at the hands of the decorator. A Gothic style of treatment has been adopted. Upon a faint blue ground decorative "curtains" are depicted, and in the surmounting frieze a strong blue quatrefoil appears in a rich brown foliage setting. Around the base of the ceiling the quatrefoil is again effectively brought out in strong red in the sunk panels of the woodwork. The ventilation arrangements have been overhauled and improved. The improvements have been carried out by Messrs. D. and J. E. McMillan, architects; the contractors being:—For the joiner work, Messrs. Garvie and Sons; painter and glazier work, John Whyte; ventilating arrangements, J. F. Anderson, Bath Street.

The Plans Committee of the Town Council has approved the plans of the following: Two dwelling-houses and business premises on the north side of John Street, for Messrs. Scott and Sellar, plasterers, per Messrs. W. and J. Smith and Kelly, architects; two dwelling-houses on the east side of Great Northern Road, for Messrs. Pringle and Slessor, builders, per Mr. Peter Slessor, architect; dwelling-house on the north-west side of Walker Road, Torry; two dwelling-houses on the north-east side of Duthie Terrace, for Mr. John Murray, builder, Glasgow, per Messrs. J. and W. F. McRobb, builders; four dwelling-houses on the north side of Gladstone Place, per Messrs. Harper and Sutherland, architects. The Committee had also before it the plan of four dwelling-houses on the south side of Merkland Road East, for Mr. James Cooper, builder. The Committee approved of the plan, but as there is no sewer at present in Merkland Road East, the Committee resolved to require Mr. Cooper to drain the buildings into covered cesspools, to be constructed to the satisfaction of the Burgh Surveyor.

BELFAST.—The Crescent Church, Belfast, after having undergone a complete renovation, has just been re-opened. The interior decorations have been carried out by Mr. Alexander Thompson, Dublin Road, under the supervision of Mr. J. B. Wilson, of Glasgow, the architect for the buildings. The work has cost some £500.

BRADFORD.—The Presbyterian Church of England has been re-opened after recent alterations. The organ has been reconstructed and fitted with pneumatic action, a hydraulic engine has been fixed, and the console has been placed in front of the pulpit. The school-room has been made more comfortable, and various other improvements effected, at a total cost of £550.

BRIGHTON.—A technical school, provided at a cost of about £24,000, was started by the Brighton Corporation a few days ago. The building stands on a site facing the public recreation ground, and within easy distance of the railway. It is expected that the school will be largely used by students in other parts of Sussex. It will be the aim of the Town Council to make it a most substantial addition to Brighton's importance as an educational centre. The cost of the building and its equipment, as well as the expense of maintenance, will, it is anticipated, be covered by the Government grants under the local taxation account. The building has a frontage of

red brick and terra-cotta, with a marble staircase. The walls of the staircase and vestibule are filled with panels of marble brought from all parts of the world, inscribed with their names and their uses or defects for building purposes.

BRONDESBURY.—A new building is about to be erected in Calcott Court, Brondesbury, parallel with High Road, Kilburn, to be called Calcott Court, with frontage of 140ft. The block will consist of residential flats, with extended right and left wings designed in the Georgian style. It is intended to arrange a front lawn or court, with a gravel sweep, garden seats; and a sundial in centre of lawn. This, with a front of plain red brick, with gauged arches and aprons and green Venetian shutters, will have a quiet and retiring effect; while each flat will have the accommodation and modern improvements of a self-contained residence. Messrs. P. Palgrave and Co., Westminster, are the architects for the work.

CARDIFF.—The laying of foundation stones of a new chapel in Machen Place took place the other day. The accommodation of the old school chapel having proved insufficient, the trustees decided to build a more commodious edifice immediately adjoining the old structure. The new church is in the course of erection, and is being built on land belonging to the Right Hon. Lord Tredegar. The style of the architecture is Gothic, one of the principal features being a tower and turret at the north-west angle of the building. The materials used are New-bridge stone with Bath stone dressings, and the internal woodwork is of pitch-pine. The edifice, which will accommodate 650 people, will cost about £2360, and the work is in the hands of Messrs. Cox and Bardo, contractors, Elm Street, Cardiff. The architects are Messrs. Habershon and Fawcner, of Cardiff and Newport.

CHISWICK.—The property recently known as Grove End House Estate, including a somewhat modern Elizabethan mansion fronting the river, has now been disposed of, and is to be laid out as a building estate, involving the demolition of the house. Messrs. Palgrave and Co., Victoria Street, S.W., are retained as the architects and surveyors for the work, the plans for which are now being prepared.

GLASGOW.—Traffic on Buchanan Street, Glasgow, between St. Vincent Street and West George Street was suspended on Monday week to allow of the laying down of a new sort of paving by way of experiment. The material is a kind of asphalt, is the patent of an American Company, and is named alcatraz. Its chief constituents are a quartz sand found on the coast of California, fibre, and bitumen. Although new in this country, the alcatraz paving has been in use in America for a considerable number of years, and it is said to stand wear admirably and also extremes of heat and cold. The workmen engaged in laying the pavement have been brought from America, and are mostly men of colour. In putting it down they are assisted by a small and very rapid steam road-roller. The asphalt is laid on the top of concrete to a depth of 3in. The pavement is to be upheld by the Company for five years, free of cost to the Corporation.

At a special meeting of the Dean of Guild Court on September 22nd, Mr. Daniel Gold, builder, was charged with a series of deviations from linings granted by the Court in respect to tenements in New Street and Shuttle Street. He was charged with failing to pave the back courts behind these tenements; with not making the proper connections in the soil and drain pipes; with not putting locks on the doors and seats in the water-closets at 27 and 29, New Street; with failing to strap an outside gable at 27, New Street, or otherwise prevent damp from entering the wall; with making the windows of a water-closet at 29, New Street 2ft. 2in. in place of 3ft. 2in.; with making the height of the ceiling of a bedroom at 29, New Street 9ft. 4in. in place of

9ft. 6in.; with making the partitions between the presses at 27 and 28, New Street of wood instead of brick; and with allowing tenancy without first obtaining a certificate from the Master of Works. The Provost said the Court would like it to be clearly understood that the Dean of Guild Court had been instituted primarily for the protection of the public and the promotion of public health. In respect to the present case they fined Mr. Gold £5 in each of the three cases of deviation from plan, and ordained him to lift the back courts and pave them with granolithic, to put the soil and water pipes in proper order, to enlarge the water-closet window, and at 27 and 28, New Street make brick partitions between the presses—all to the satisfaction of the Master of Works; for allowing occupancy without certificate, £5 for each of the three tenements—total, £30. An appeal was intimated.

HAMPSTEAD.—A block of residential mansions are now in course of erection on the site of "The Forge," West End Lane, N.W. There are to be three self-contained flats on each floor, with separate main entrances, and containing dining and drawing-rooms, kitchen, scullery, larder pantries, &c.; w.c.'s, bath, and lavatory, with service lifts, four bedrooms. The building will be fitted with all modern improvements, including electric light. Messrs. P. Palgrave and Co., 28, Victoria Street, S.W., are the architects.

HUDDERSFIELD.—A large meeting of the General Purposes Committee of the Huddersfield Corporation last week had under consideration the status of Mr. R. S. Dugdale, the Borough Surveyor, whose affairs are now in bankruptcy. The meeting lasted an hour and three-quarters, and came to the consideration of the matter after it had been dealt with at a protracted sitting of the Finance Committee. The result of the proceedings was that, by an almost unanimous vote, the General Purposes Committee came to the conclusion that opportunity should be given to Mr. Dugdale to send in his resignation. Whilst not a few members of the Committee gave expression to a feeling of sympathy with Mr. Dugdale in his difficulties, it was evident, on the other hand, that a pretty general opinion prevailed that the proper conduct of corporate affairs and the discipline of the department more intimately concerned required that such a decision should be arrived at.

HULL.—The new cricket ground of the Hull Cricket Club Limited, is rapidly progressing towards completion. The ground comprises an area of over sixteen acres, leased from the North Eastern Railway Co. Ltd., and will be enclosed by a light fence. In the centre and on the west side will be situated the Members' Pavilion, which will be formed upon the top of seven or eight terraces used for seats, and will accommodate over 1500 members. On the right of the pavilion is the Grand Stand, and upon the left the Bowling Green of the Hull Bowling Club. The whole of the land is to be thoroughly drained. The Public Park adjoins the site, and is situated at the back of the Pavilion. The whole of the work, including draining and laying of wickets is under the supervision of Mr. Percy T. Runton, architect, Hull.

KILBURN.—The familiar but by no means picturesque landmark at the top of Shoot Up Hill, Edgware Road, and known as the "Old Mill," Kilburn, is to be demolished, and an imposing block of residential flats are to be erected on the site with a return frontage to Mapesbury Road. There have been considerable building operations in the surrounding localities for some time past of good-class property, and the removal of this unsightly structure referred to will certainly assist to improve that part of Kilburn—on the main road to Hendon—now so popular with Sunday travellers. The new building is to be faced with red brick and stone, and contain in all sixteen complete sets of residential flats. Tennis lawns will be arranged in front with balconies overlooking the same. Each flat will be self-contained, with dining and draw-

ing-rooms, kitchen, scullery, larders, &c., service or tradesmen's lifts, two w.c.'s, bath and lavatory, four bedrooms, electric light, and speaking tubes from entrance hall to each flat. Messrs. P. Palgrave and Co., Westminster, are the architects; and the building is estimated to cost £12,000.

LEEDS.—The following are the principal results obtained in connection with the work done during the past year under the Science and Art Department, South Kensington:—Studentship in training, tenable at South Kensington, minimum value £220—F. Paul. Royal exhibition, tenable at South Kensington, value £160—J. F. Friedenson. Local scholarships, value £60 each, tenable at the Leeds School of Art—R. H. Smith and J. A. Hancox. The total value of scholarships won by this school is over £500, and is one-tenth of the scholarships offered by the Department for competition among all Schools of Art in the United Kingdom, the only school to obtain more awards being the Royal College of Art, South Kensington. The results of the National Competition were:—Silver medals—A. J. Rushton, drawing from life; and A. J. Rushton, for drapery arranged on the model. Bronze medals—Annie Cartlidge, painting still life; Fanny L. Cowell, painting in monochrome; F. C. Drake, modelling ornament; J. T. Friedenson, drawing from life; Inez Laws, modelling from life; E. S. Ounsworth, decorative design; F. Paul, architecture from measurement; A. J. Rushton, painting nude figure from life; A. Schofield, drapery on antique figure. National Competition Queen's Prizes—Lavinia Brogden, for design; Frances E. Callum, painting in monochrome; G. C. Duxbury, drapery on antique figure; G. C. Duxbury, for painting still life; Ethel Mary Denison, modelling from life; J. T. Friedenson, figure design; R. Goldstone, decorative design; H. E. Henderson, architectural design; Inez Laws, modelling from life; Julia Lee, modelling anatomical figure; E. S. Ounsworth, decorative design; F. Paul, drapery studies; F. Paul, design in monochrome; E. F. Reynolds, modelling ornament; H. Swanwick, architectural design; A. Schofield, head from antique; A. Schofield, architecture from measurement; Tamar B. Wick, painting figure in monochrome; H. Walker, design in relief. The results in the National Competition are the highest ever obtained by the school.

NEWCASTLE.—At the Trinity Presbyterian Church, Northumberland Road, Newcastle, the Sanderson Memorial Window was unveiled on the 23rd inst. Stained glass windows are somewhat rare in Presbyterian churches, and, if we are not mistaken, the Sanderson Memorial is the first window of the kind placed in a Presbyterian place of worship in this district. Old prejudices having given way to the introduction of church organs, it is hardly likely that they will continue to prevail against the painted window. The window occupies the entire north gable of Trinity Presbyterian Church. It has been admirably grouped, and brings out in an imposing manner the three following subjects:—"Christ Comforting the Afflicted," "Blessing Little Children," and "Feeding the Multitude." Each group occupies two openings. In the lower divisions of the window are six angels, bearing scrolls, on which are written the memorial inscription. The tracery above is filled with the representation of an angelic host. The general scheme of colouring is rich and warm in tone, the draperies being enriched with delicate diapers, giving to the whole a chaste effect. The canopies, which are architectural in character, are of a soft, greenish white, relieved with gold. The draughtsmanship has been most skilfully handled, the expressions of the faces being particularly fine. The artists are Messrs. Atkinson Brothers, of Newcastle.

OSWESTRY.—At the Greyhound Inn, Willow Street, a large part of the roof from wall to wall collapsed a few days ago, the oak beams and rafters, with heaps of slates, being precipi-

tated into the rooms below. Later there was another serious collapse, whereby the Inn, the cottages, and the old malt-kiln were unroofed from end to end. The block is, perhaps, two hundred years old, the malt-kiln was for forty years used by the late Mr. Thomas, of Ardmilan, and the Inn is one of the oldest licensed premises in the town. The beams and rafters are very old, and it was thought the fall was precipitated by the heavy weight of the old slates having become sodden with the recent rains.

OTLEY.—The foundation-stone of a new Congregational church, which it has been decided to erect at Otley, in place of the one which has been in existence for upwards of sixty years, was laid within the past few days. The new building is to be in the Decorated Gothic style, and will have a spire, the apex of which will be 94ft. above the ground. The church will contain sitting accommodation for 542 worshippers, but 700 persons may be comfortably accommodated within the walls when necessary. Contracts already accepted in connection with the building amount to £6000, but the cost of the church when completed will probably be not far short of £6500, exclusive of boundary walls. The architects are Messrs. T. H. and F. Healey, of Bradford.

PETERBOROUGH.—A remarkable discovery has just been made at the village of Orton Longueville, near Peterborough. Several workmen were engaged in excavatory work under some old and dilapidated outbuildings on a farm, when they came across a well-made floor, about 6ft. below the level. On a minute examination being made, they found that the floor was entirely constructed of knuckle-bones, supposed to be those of sheep and cattle. It is estimated that the singular work is at least 150 years old.

SCARBOROUGH.—The Scarborough bricklayers, who are on strike for an increase in their wages from 8d. to 9d. per hour, have again refused the offer of the masters to advance ½d. per hour. Some of the Scarborough employers have conceded the penny, and a large number of the men have left the town, and obtained work elsewhere at the fully enhanced rate.

WIGAN.—The re-opening of St. Patrick's Church, after extensive alterations and improvements, took place within the past few days. The following is a short description of the improvements: On the wall, immediately behind and above the High Altar, are some cleverly executed monograms in coloured oils and gold leaf, alternately of the crown and cross and "I.H.S." Directly in the centre and high above the altar is a gilded circle, in which is hung a large and handsome crucifix, brilliantly ornamented in red oils and gilt work. Below the monogram work on each side of the altar, and forming lower borders, are two paintings of the style of a conventional treatment of curtains with monograms in medallions, in the centre of which are the characters, "I.H.C." "X.P.C." and "I.C.G.," alternately with a large gilded cross. The groundwork of the whole will be covered in green oils. The roofing of the sanctuary is prettily ornamented with stars in oils and gold leaf, and this is, indeed, the case of the whole church. The body of the church is in the usual plain, but neat border work of decoration. The church, especially the sanctuary, now presents a picture of beauty, and forms an excellent specimen of the decorator's Art. The whole of the work has been carried out by Messrs. R. Park and Sons, of Preston.

A SWANSEA correspondent reports that the tinplate trade in South Wales still continues in an unsettled condition. A deputation of the steel department at Cwmburla Works has waited upon Mr. Coulson Bond, one of the directors, and was informed that the steel department would be permanently closed. The men were advised to seek employment elsewhere.

The address of the Dublin Slating Co. is 1 to 4, Lower Erne Street, Dublin.—Ed.

LEVELLING GRADIENTS FOR ROADS AND SEWERS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As a student I shall be obliged if some practical reader will show the method (by calculations) of taking levels and fixing of sights to different gradients for the laying of sewers, drains, and making of roads on any assumed plan.

J. R. F., JUN.

We presume you require information upon the practice adopted in England, as it differs from that practised abroad from the fact that England has been accurately surveyed throughout, and you can get your datum by obtaining an ordnance map, which in many other countries you would not be able to avail yourself of.

In the case of levelling for roads and sewers it usually happens that the surveyor is supplied with a plan of the estate or a portion of the parish map, upon which the line of route for road or sewer is marked and laid down by the engineer in charge of the work. He is generally supplied also with a section showing the heights of the various parts of the road or the surface of the ground beneath which the sewer will pass, and this sectional plan will also give the shape of the sewer, with the gradient or fall which it is intended to have, or in the case of roads, where the level is to be raised or a steep gradient reduced by cutting, &c., is shown. The length of the sewer from end to end is usually also given, or it can be scaled from the datum line shown upon the drawings.

You cannot do better than familiarise yourself with the ordnance map, from which you will be able to obtain any of these points which may have been missed from the plans provided for you.

One great advantage of the Ordnance Survey is that every little farm or cluster of buildings has been given a name, and although people living in the locality are often ignorant of them, you will soon be able to pick out any particular landmark, and be able to say "My roadway or sewer passes within a few chains of that"; and having when the time arrives once obtained your bearings or starting-point, you will find it very easy to connect other buildings along the line with those shown upon the map.

The levelling surveyor has generally nothing to do beyond attending to his levels and staves. The line of the road or sewer has usually been already marked out, and you have only to look in the right spot, easily found by practice, for the bench marks. These marks are to be found in all parts of the country. Wherever a prominent object can be utilised for the purpose, the Government surveyors will be found to have availed themselves of it. It may be a particular post or a coping, or a mark upon a wall. These bench marks are generally in the form of a triangle, a broad arrow, or a crow's foot. In the first and third, the exact station mark is considered to be in the centre, whilst for the broad arrow it is considered to be at the junction of the three lines.

Having found the nearest bench mark to the line of sewers or roads, the next thing is to send a man with the figure-staff, who must carefully hold the latter upright upon the bench mark. Next plant the theodolite, or dumpy level, firmly in the ground at a convenient distance between that and the line of route of road or sewer, and adjust the level very carefully, and note down upon the plan the height shown by the cross hairs of the telescope upon the figure

staff. Then send the man forward to any spot at a convenient distance in the direction of the work you intend to level, instruct him to hold the staff upright, turn the instrument round carefully, and note the height the cross hairs will show upon the figure staff. It is to be remembered that it is not absolutely necessary to plant the staff or instrument in a direct line from the bench mark to the first sighting peg which you intend driving into the roadway; they should be placed in the best position that can be chosen. Take advantage, where the ground suddenly un-

the above example, the exact depth to be sunk down can be obtained by deducting the height the sewer is to run above the datum line. For example, your sewer falls 5ft. in 1000 yards. At A the section shows the bottom of your sewer is 10ft. above your datum; deduct this from the 70ft. which is shown as the total height of the surface above datum, and it shows you must sink a shaft 60ft. deep; whereas at L, which is only 40ft. from the datum to the surface of the ground in consequence of the fall of the sewer, viz., 5ft., and this being the highest end, it is only necessary

dulates, of the lowest point of the staff in one direction and the highest in the other.

To give an example of the method of calculation, the height observed when the figure-staff is held against the bench mark at K is 6in. Upon turning the instrument round and reading the height upon the staff when placed at L, it will be found to measure 5ft. 6in., deduct the lesser from the greater and the difference in height will be found to be 5ft., i.e. the point L is 5ft. below point K, or, in other words, the height above the datum at L is 5ft. less than is shown at K.

You then proceed in the same way, down or up hill, until you get upon the line of route. You must then work as before along the line of route, taking the differences in height at the various distances, especially wherever the ground rises or falls. A peg or stake about 2ft. by 1½in. by 1½in., or 2ft. by 2in. by 2in. should be driven wherever you place your figure-staff, and the various heights should be noted upon your drawings or in a levelling book. These pegs are best driven by the side of the road or sewer, so that they are not disturbed, and can be used when checking over your levels as the work proceeds.

Most surveyors, especially when pegging out ground which is fairly level, prefer to save time and trouble in adjusting the instrument at short distances to take their sites a considerable distance apart, and put in their intermediate stakes by means of boning rods. Care must be taken in doing this to hold the rods upright.

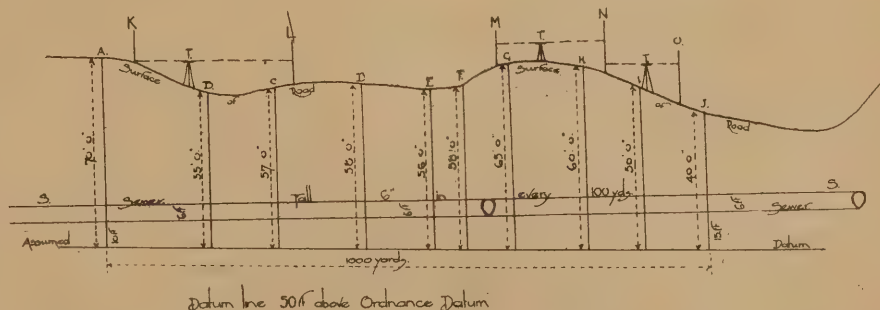

The method of using these rods is, first, with the assistance of a spirit level, drive two pegs into the ground until they are perfectly level, then drive a third peg gradually into the ground until the observer at the first stake can see the top of each head of these boring rods in a perfect line with each other. Continue the operation by removing the first rod forward. Any inclination in the ground can be found in a like manner by setting the first two pegs the number of inches apart required in a certain length. This method can be adopted for levelling from side to side of a road which has an inclination sideways when an instrument is not available; but for long lengths a theodolite or dumpy level is necessary.

Having obtained your various heights above datum by deducting the differences as shown in

to excavate 25ft. to get down to the level of the bottom of the sewer at this point.

Having by these methods of adding or deducting from the dimensions shown above datum upon the section obtained the necessary levels, most surveyors drive pegs usually where a shaft is going to be sunk on either side of the trench. A long parallel straight-edge placed across these pegs will enable the surveyor by careful measuring from the underside to drive a peg at the bottom of the shaft, from which the excavators or miners who drive the tunnels can level. Their method of doing this is as follows: The fall to be given is, say, 6in. in every 100 yards, or ½in. in every 10ft. A straight-edge is then made, which is

Longitudinal Section.

out of the parallel ½in. in its length. By placing the narrow end upon the peg at the higher end of the length of sewer and levelling the top edge of the straight-edge exactly, the exact fall can be obtained. The workmen driving the same tunnel from the lower end have an exactly similar straight-edge, but they reverse the process and place the widest end upon the peg which is driven in their shaft. In a sewer of any great length, if too deep to pay for excavating as open cutting, it is usual to sink several shafts several hundred feet apart and drive tunnels from each end so as to meet in the centre.—ED.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In the article entitled "Practical Carpentry and Joinery" the botanical name of pitch pine is given as *Pinus Australis*, whereas "Rivington's Notes," Vol. III., gives it as *Pinus rigida*, while Colonel Seddon, in his "Builders' Work," agrees with Newland in "The Carpenter and Joiner's Assistant," by giving it as being *Pinus resinosa*. I should like Mr. Ellis to point out, if he will, the difference in the varieties named; or are all three names used by botanists to describe one species, or rather one single variety of tree?

Also would Mr. Ellis, before he concludes his description of woods, kindly give a few lines about satin walnut, which is very seldom mentioned in standard text books.

I am, yours truly,

A. R. ECNAN.

121, Lee Road, Blackheath.
September 18th, 1897.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reply to your correspondent, A. R. Ecnan, there are two distinct varieties of the pitch pine, *P. rigida* and *P. Australis*; the former, growing in the Northern States and Canada, is not now exported in any quantity, which was my reason for not describing it. It is a very inferior timber to its southern congener, and may be distinguished by its smoother bark, softer and straighter grain, lighter colour and weight. It is usually spongy at the heart; the sapwood is white. That of *P. Australis* is greenish yellow. This wood is known in America as Georgia pine and turpentine tree; not to be confounded with *Syncarpia laurifolia*, the turpentine tree of New South Wales. *Pinus resinosa* is another name for the red pine of Canada (*Pinus rubra*). I find on reference to my Laslett that no mention is made of satin walnut, so I give the following particulars relating to that wood. The satin walnut, white walnut, or butternut (*Juglans cinerea*), a large and lofty tree, flourishing in the valley of the St. Lawrence, Ontario, Georgia, and Arkansas. The wood is light, soft, rather coarse grain, easily worked, satiny lustre, takes high polish, medullary rays, thin and obscure colour, a bright light brown, turning dark with exposure, sapwood grey; the inner bark used as a mild cathartic medicine; also a yellow dye; a cabinet wood.

A to J. lines showing depths given on sectional plan
S. line of sewer
T. theodolite levelled to get various heights

For further information relative to the above and cabinet woods see Marshall Ward's edition of "Laslett's Timber Trees" (Macmillan and Co.)

Yours truly,
GEO. ELLIS.

LAST week a new bridge over the River Lowther at Askham, erected by the Westmorland County Council at a cost of over £2000, in addition to the value of the stone, was opened.

SOCIETY MEETINGS.

Northern Architectural Association.—The members will hold an excursion meeting in Newcastle on Saturday next, when the buildings inspected will include Jesmond Parochial Hall, St. Jude's Church, and Sheffield Board School. The Association again offers to students (and associates not in practice, nor yet 25 years of age) a first prize of £2 2s., and a second of £1 1s., for the best set of drawings or "testimonies of study," as required by the R.I.B.A. to be submitted for its final examination. Similar prizes will also again be given for the probationary work for the intermediate examination.

The Glasgow Architectural Association.—At a recent meeting presided over by the vice-president, Mr. G. S. Hill, Mr. James A. Morris, the honorary president, delivered a lecture on "Attainable Ideals." Mr. Morris had on the walls a very interesting collection of working drawings, which he had specially obtained from some of the leading architects, including the late John D. Sedding, John Belcher, Ernest George and Peto, Ernest Newton, C. F. A. Voysey, R. Schultz, Balfour and Turner, and Dunn and Watson. The lecturer, after expressing his gratefulness for the honour done to him by the Association in electing him as its honorary president, took the drawings around him, which he said were better than many lectures, as his theme. He said: "The good influence of John Sedding for purity and gentleness, love of his art and mankind, and all that goes to the making of a true and simple artist, will not be interred with his bones. His drawings upon our walls show abundantly his vivid imagination, his keen desire for perfection and the infinite labour he gave in seeking it, his nervous directness of touch, his breadth, simplicity, and power." He was sorry that he had no drawings by Norman Shaw, who had written him that drawings were only a sort of alphabet with which to instruct the builder, and when he was done with them they should be burned, as apt to mislead people. The lecturer maintained that high ideals and noble thought would elevate and ennoble an architect's work, however great the influences restraining him were. He advised his hearers to study from Nature—to learn the subtle beauty and strength of the human figure, which was a mine of purest gold. From these they would learn that the greatest dignity was ever simplest, and he said "if you ever receive that truth and become imbued with it, your buildings, be they great or small, would carry out the same idea."—The lecturer was warmly thanked for his remarks.

The Trustees of the Sydney Art Gallery are making arrangements for an exhibition of Australian pictures in the Grafton Galleries, London, in April, 1898.

Our Cardiff correspondent writes:—The strike of Barry navvies has terminated with the men resuming work on the old terms. Nine weeks ago 1300 men struck at the works in connection with the new dock at Barry for an advance in the minimum rate of wages from 5½d. to 6d. per hour, and also the adoption of a code of rules.

The Post Office is laying an underground telegraph cable from London to Birmingham. Work has been begun at Watford, and about nine miles of cable have been laid on either side of the town. The cables are drawn into 3in. cast-iron pipes, thirty miles of piping having already been put down. It is intended to use the dry air system to keep up the ventilation of the line.

The Markets and Fairs Committee of the Bradford Corporation has considered plans for the erection of an Art Gallery in connection with the proposed alterations of the markets in Rawson Square. It is proposed to devote the whole ground space to the markets extensions, but to build overhead on the corner of the site a new Art Gallery, with lock-up shops beneath. The scheme was left over for future consideration.

THE QUARRY BANK MINES.

IT would appear that the agitation with regard to the Quarry Bank mines is definitely coming to a close, the local urban council at Quarry Bank having passed a resolution rescinding a motion to send to the Local Government Board a full report of the position of the district in consequence of the mining operations of Lord Dudley. Mr. Shaw, the mover of the resolution and secretary to the property owners' committee, explained that when the scheme of the property owners to purchase the mines, and so save their premises, fell through, owing to some of their number standing aloof, they resolved to make a final effort to save the buildings on the surface. Counsel's opinion was taken as to their legal rights, but this was against them, and a large bill of costs was run up. As the public had expressed so much interest in the question, an appeal was made for help. Mr. Shaw observed that all that the interested and sympathetic public contributed was £5. Compromise was then deemed the best course, and Lord Dudley's agents, being approached, were found willing to assist them, the assistance being confined to those who had agreed to join in the purchase scheme, and with the understanding that the agitation should cease. The terms were accepted, a sum of money was deposited in the hands of a committee of property owners, and the advice of experts had been given as to the protection of properties. As a result of the understanding come to, the belief was expressed that the mines were being worked at Quarry Bank with less relative damage than is the case in the ordinary mining districts of the Black Country. So far as the principal property owners are concerned, the agitation will not go on.

DAMAGES AGAINST DESERTING BRICKLAYERS.

At the Selly Oak Police Court a claim by Messrs. James William and William George Banbury, builders, of Newport, Mon., for damages against William and Arthur Peacock, bricklayers, was heard recently. Mr. Stubbs stated that the plaintiffs entered into an agreement to build forty-four cottages at Bournbrook, and in consequence of the scarcity of bricklayers found it necessary to bring over several men from Newport. The defendants, who were amongst the number, signed an agreement to work for twelve months at 50s. a week, and Messrs. Banbury paid their fares to Selly Oak, and gave them money in advance. They worked from August 23 to September 4, and then left, giving as their reason the fact that two apprentices were employed in the work. Defendants were very good workmen, and in consequence of their leaving complainants had been put to great inconvenience, and the work had been stopped for three days.—The Bench made an order for the defendants to pay £5 each damages and costs, at the rate of 10s. a week.

AMALGAMATION OF POTTERY FIRMS.

Messrs. Morrison, Ingram, and Co. Ltd., of Hygeia Works, Manchester, announce that they have converted into a private limited company their own business and the business of Messrs. Staley Bros., of Midway Pottery, Staffordshire (with whom they are amalgamated). It is the intention of Messrs. Morrison, Ingram and Co. to extend and re-model Midway Pottery, building increased foundries, sanitary engineering workshops, and sanitary pottery works upon recently-acquired land, upwards of eight acres in extent, and situate in Tifford Park, near Manchester Docks. The increased facilities which the proposed works' extension will afford will no doubt be favourably regarded by the Company's patrons, whilst the works extension must be regarded as a healthy sign of the times.

DISPUTE BETWEEN LOCAL AUTHORITIES.

The Local Government Board has decided a question of considerable importance as affecting the powers and rights of certain Town Councils. The Blandford town authority gave a tradesman permission to bring out his shop window over the pavement some 15in. to 18in., to be in a line with like windows on either side. The County Council, who contribute towards the maintenance of the highway, demanded that the projection should be put back, as being an encroachment on the public footway. The Town Council refused to comply, considering that its powers and rights in this connexion had not been abrogated by alliance with the County Council for the purposes of the maintenance of main roads. The latter body thereupon withheld the sum of £31, due in respect of the portion of the highway in question, until the window was displaced. The result of the dispute was an appeal to the Local Government Board, which has supported the Town Council and ordered the county authority to pay the sum withheld and the cost of the inquiry.

CLAIM AGAINST A CONTRACTOR.

At the Wigan County Court last week, before Judge Jones, Thomas Beardsworth, a labourer, of 1, Edith Street, Wigan, sued Wm. Winnard, contractor, of Wallgate, for the sum of £178 18s., as damages for personal injury under the Employers' Liability Act. The plaintiff set forth that Beardsworth was a workman in the defendant's employ, and was injured through a wagon full of earth tipping up and emptying itself on him. The wagon was part of the plant used by the defendant in his business, and was defective in that it had no catch on it, and that such defect arose from or had not been remedied owing to the negligence of the defendant or his foreman or manager.—The Judge found that there was no defect and no negligence, and therefore gave a verdict for the defendant.

MESSRS. HARTLEY AND SUGDEN, LTD.

Messrs. Hartley and Sugden's supplementary catalogue, just to hand, covers a collection of boilers varying much in pattern and design, but resembling one another in a very important particular—the large proportion of heating surface, which, of course, is the secret of a successful boiler. Messrs. Hartley and Sugden have attained a marked success in their treatment of boiler heating systems, and many of their designs are very well-known in the trade. There are, however, one or two patterns illustrated in the present catalogue to which we would refer. Firstly, to the "Eiffel" and the "Lion." These are new and powerful hot-water heating boilers which, we understand, have proved very satisfactory in work. The larger sizes of the "Eiffel" are made with bent tubes welded into the fire-box, which add valuable heating surface and give rapid circulation of the water. The "Lion" is arranged with shallow fire-box of good diameter, the tubes being placed so as to give the best results from the fuels used. Three other designs of boilers—the new independent "Lawrence," the "Effective" and the "Scorpion"—also claim attention. We are assured that they will be found much more effective, at the cost, than the American cast-iron boilers, and being made of wrought-iron, are better adapted to withstand the strains of a variable climate. They are each fitted with an automatic regulator, and are very economical in fuel. Among the other boilers comprised in the catalogue are the well-known "Climax," the "Excelsior,"

the "Monarch," the "Trentham," the "Duchess," the "Stanley," &c.

PHRAHZIT—A NEW MATERIAL FOR FLOORING, ETC.

Specimen patterns of the new Phrahzit have been submitted for our inspection. We have also seen reliable testimony as to the merits of the new invention. Phrahzit—a new patented material for flooring, roofing, paving yards and footpaths, wall decorations, strong rooms, etc.—has many advantages to recommend it. It is a composition of very attractive appearance, is very light, impermeable, and fireproof, and may be easily and cheaply laid in a single sheet of any desired size, or in tiles or mosaics. It can be made in any colour, and, within forty-eight hours of laying, sets to the hardness of stone. Then, Phrahzit has the recommendation of the sanitarian. The inventor, Mr. Joseph T. Syek, of 63 and 64, Chancery Lane, W.C., claims for it, on sanitary grounds, a superiority over any floor or wall covering material yet introduced. Its durability, too, may be argued from its impermeability and fireproof qualities. And, as a decorative material, the use of Phrahzit promises to be equally advantageous. Being of a plastic substance, the material can be moulded and shaped into any design; it, therefore, lends itself to the formation of ceiling and wall decorations, pilasters, balustrades, and other architectural embellishments. Very good effects may be obtained in

wall decorations, but its use in this connection may very wisely be influenced by considerations of its non-inflammable nature.

THE DECORATIVE WORK AT THE NURSES' HOME, DUNDEE.

The inside decorative work of the Nurses' Home at the Royal Infirmary, which was entrusted to Messrs. P. and A. Davie, Victoria Road, is now nearly completed. Throughout it is of a most artistic character, and reflects credit alike on designer and executor. The ceilings and walls of the bedrooms—thirty-seven in all—are covered with a pretty, cheerful paper. The woodwork is grained light wainscot, the floors having bog oak margins. At the ends of the corridors the bathrooms are situated. These have all tile floors and walls, the woodwork being of varnished pitch pine. The drawing-room, a large and commodious apartment on the ground floor, has a panelled ceiling, painted and decorated to match the paper. There is also a handsome 2lin. frieze underneath the cornices, which are done up in a most artistic style. The woodwork is grained walnut, varnished with carriage varnish, the floor having a margin of 2ft., stained bog oak. The sitting-room and library are decorated in a similar manner. Pretty warm tints are to be seen on the staircase and lobby, which are painted dado, with lines and bands underneath, the floors having a beautiful dark-stained margin. The entrance hall has a tiled floor, with decorations similar to the staircase and lobby. Altogether, when completed, the Home, which is the gift of Sir William Ogilvy Dalgleish, Bart., will present a most attractive interior.

The General Works Committee are prepared to receive APPLICATIONS for the APPOINTMENT of BUILDING INSPECTOR in the City Engineer's Department.

Candidates must be thoroughly qualified persons and will be required to undertake the inspection of new buildings and drains, to fix levels, to make surveys of all new houses, buildings, and drains, and to keep the necessary records in connection therewith.

The candidate appointed will be required to act under the immediate direction of the City Engineer. The commencing salary will be at the rate of £130, and a bicycle will be provided by the Corporation. The age of the candidates must not exceed 40 years. A list of duties may be obtained on application.

Applications, in candidate's own handwriting, stating age, experience, past and present employment, accompanied by copies of not more than three recent testimonials, and endorsed "Building Inspector," to be sent to the undersigned not later than TEN a.m. on TUESDAY, OCTOBER 5th.

Canvassing, directly or indirectly, will be considered a disqualification.

J. E. SWINDLEHURST, C.E.,
City Engineer and Surveyor.

St. Mary's Hall, Coventry.

WOODFORD URBAN DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR, &c.

The Woodford Urban District Council invite APPLICATIONS from qualified persons for the office of SURVEYOR for their district, which has a population of about 13,000, and rateable value of £60,000.

Candidates must not be more than 45 years of age, and have had practical experience of the work of the office, and are requested to state whether they are willing (if required) to enter into an agreement to serve for three years.

The person appointed will be required to devote the whole of his time to the duties of the office, and to reside in the district.

Salary, £200 per annum, payable monthly. An Assistant is provided by the Council.

Applications, accompanied by copies (which will not be returned) of not more than three testimonials of recent date, must be sent to the Chairman of the Council, not later than NOON, on MONDAY, OCTOBER 4th, endorsed "Surveyor."

Canvassing will be deemed a disqualification.

By order,

ROBERT MARTIN,

Council Offices,
Woodford Green, Essex,
Sept. 20th, 1897.
Clerk to the Council.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A.,
DESIRES TO ASSIST others
in the
PREPARATION OF DRAWINGS
at his own office.
G. SCOREE, 28, Newman-street, W.

ABLE ASSISTANCE rendered by young Architect with spare time on all classes of architectural work, quantities, &c.—1, West Terrace, Whitby.

ARCHITECT'S ASSISTANT (22) desires ENGAGEMENT in London. Capable draughtsman and colourist; quantities for plain work, office routine, knowledge of sanitation; good reference; salary 30s.—WALLACE, Manse, Kendal.

BUILDER'S ESTIMATES accurately PREPARED by experienced Surveyor, at own offices on speculative terms. Perfect system for country work, quantities, or otherwise, returned with dispatch.—"Estimator," 7, St. Mary Axe, E.C.

SURVEYOR'S or BUILDER'S ASSISTANT seeks RE-ENGAGEMENT. Ten years' experience. Quantities, variations, estimating, and usual routine. Excellent references.—Address, F., care of Francis, Surveyor, 8, John-street, Adelphi, W.C.

DRAUGHTSMAN (Architectural) seeks ENGAGEMENT. Seven years' good practical experience.—Apply to E. X., 256, Vauxhall Bridge-road, S.W.

ARCHITECT'S ASSISTANT desires RE-ENGAGEMENT. Working drawings, &c. Five years' London experience.—W. F., 65, Eltham-road, Lee, S.E.

BRAMLEY FALL & ROBIN HOOD STONE

In large quantities and any sizes supplied immediately, either dressed ready for fixing or in the rough.

APPLY:

B. WHITAKER & SONS, Ltd.,
HOESFORTH, LEEDS.

Telephone, 2321.

LONDON PLATE-CLASS INSURANCE CO. LTD.

Head Office: 49, Queen Victoria St., E.C.

Glass of all kinds covered by the Policies of this Company.

IMPORTANT
EDITORIAL ANNOUNCEMENTS.

A WEEKLY ARCHITECTURAL CAUSERIE.

The Editor of "The Builders' Journal" has pleasure in announcing that, after this issue, the short, terse Leaderettes, which have become so prominent a feature of "The Builders' Journal," will be increased in number, a wider range of subjects being thereby covered. These Articles will be contributed by, amongst others: Messrs. E. Ingress Bell, H. B. Creswell, Howard Inc, A. R. Jemmett, H. V. Lanchester, C. E. Mallows, G. Ll. Morris, John E. Newberry, and Hugh Stannus.

The Editor also announces that a SERIES OF TECHNICAL ARTICLES, by Experts, entitled "PRACTICAL PAPERS," will be published, IN ADDITION TO THE SERIES in the Surveying and Sanitary Supplement issued weekly with the Journal. SETS OF WORKING DRAWINGS of Buildings in process of erection will also appear from time to time.

The Editor will also shortly announce the SCHEME OF PRIZES for ARCHITECTURAL SKETCHING in that NATIONAL TREASURE HOUSE, the South Kensington Museum.

MORE than passing Churchman and interest should attach to the views of Sir William Artist.

Richmond, as expressed at the Church Congress, and reported in our pages elsewhere. It could hardly be that one who has had such an exceptional opportunity for untrammelled realisation of his conception in the decoration of a noble church should fail to convey to his hearers a lively picture of the ideals that have guided him in his work. These, it is easy to see, are those of Gothic mysticism rather than the sensuous forcefulness of later times—a mysticism that, while most in harmony with the average churchman's interpretation of his religious life, to some minds constitutes a grave danger to our church in the possibility that, carried to excess, it divorces its votaries from the practical considerations of the outer world, and fosters an artificial environment tending to stifle the utility of any belief as an ethical guide to the generality. The artist is, however, the man on whom it is easiest to forgive

such an attitude, for it is one essentially characteristic of an introspective and imaginative temperament; as such he is, in the present day, the real survivor from the middle ages, and in fact the decorator of St. Paul's shows very clearly that he would have felt more at home among the great mediæval builders than among his present confrères: his sympathies do not seem even to travel as far as the great building on which his skill has been expended. The epicureanism of colour and line that distinguishes the work of the Renaissance is not for him, and Salisbury or Ely would have been a more congenial sphere for his labours. Sir William evidently strongly feels the futility of many modern ideals when he makes his attack on the commercialism of the present day, and he doubtless touched a sympathetic chord in his audience, but such an attack must, in the very nature of things, miss its mark. Those who are guided by no higher spirit will inevitably be incapable of discovering that their guide is

periods is foredoomed to failure. The choice of the subject title under which Sir William Richmond's remarks come—"Art and Architecture in the Service of the Church"—is an example eloquent of imperfect perception. An Art consciously subservient must be of the nature of a pose. How would our reverend friends relish it if we put the matter the other way round? "Religion in the Service of Art" would be, to the genuinely artistic mind, by no means a more one-sided way of expressing it; for the two, while, of course, inter-dependent, and subject to the same influences, can never be subordinated the one to the other without losing that spontaneity which is essential to all emotional expression. Some thought such as this seems to have been passing through our lecturer's mind when he makes his references to "styles" *versus* "style," but whether his views went so far is not clear from the report that lies before us. At all events, he made a very definite

LEDSHAM CHURCH. R. A. EASDALE.

but a phantom that ignores all paths leading to the higher development of the race; each age must work out its own salvation by harmonious evolution of its highest characteristics. Such an evolution may be helped forward by an intelligent comprehension of previous ones, but its course none can predict beforehand, and any attempt to draw it into lines that belonged to other

protest against the rehabilitation of dry bones that so frequently does duty for ecclesiastical decoration; if it be possible for the churchman and the artist to meet on equal ground, something better would surely result, but in an age in which the prevailing temperament is so far removed from mediæval romance and mysticism it is hardly probable that our conceptions, if spontaneous,

East End.
Selby Abbey.

September 1896
R. A. Casdale del.

will be in accord with those of other times. We generally find either a lifeless archaeological accuracy, or a lack of harmony between the decorator's ideals and his environment. When occasionally we come upon a man who can steer between these extremes, and who can enter, as nearly as the lapse of four centuries will permit, into the spirit in which our great churches were built, we may thankfully give him his opportunity. If we find him not, it will be better for our reputation with posterity that we should steadfastly refuse to do anything unlikely to enhance the religious character essential to the church of our ancestors.

RESTORATION AT GLOUCESTER.

THE Lady Chapel of Gloucester Cathedral, one of the finest specimens of Perpendicular style of Architecture in England, which has been closed for twenty-five years owing to the ruinous state into which it had fallen, was reopened last week after restoration. Ten thousand pounds have been spent in the restorative work at the Cathedral during the last few years. Dr. Spence, the Dean of Gloucester, gave an historical survey of the Lady Chapel, which, he said, was built from designs of monk designers of Edward of York and of Henry Tudor, and it had now been so restored that it would stand for centuries. But they were only on the threshold of the work of restoration, and he hoped to see the chapel again put on some of its ancient beauty and splendour. The marvellously beautiful but now disfigured reredos they dare not repair, but he would like to see the four great central windows once again filled with the richest glass the age could produce.

An important scheme has been formulated for the sanitary reformation of Bombay City, at a cost of five crores of rupees.

THE CONDITION OF THE PARTHENON.

“THE Parthenon is doomed!” Thus begins an article in your issue of August 14,” writes Professor Dr. Wilhelm Dörpfeld in last Thursday's Times, “which has created a sensation, not only in England, but throughout Europe. Is the Parthenon really doomed? Is this gem amongst the monuments of the world irreparably lost? Is it impossible to save it? As a student well acquainted with the Parthenon, and as a member of the committee appointed by the Greek Government to superintend the repairing of it, I think I may assert that the temple is by no means yet doomed. The condition of the structure is certainly not satisfactory. Earthquakes and fire, rain and sun, frost and heat, several bombardments, and more especially the unfortunate explosion of the Turkish powder magazine by the Venetians under Morosini in 1687, have all contributed to annihilate entirely large portions of the temple and severely to injure those still preserved, and even to destroy in many places the beautiful white marble. One has only to read the reports of the three distinguished European architects—the Englishman, C. F. Penrose, the German, T. Durrm, and the Frenchman, T. Magné—on the state of the temple in order to satisfy himself that the structure has indeed suffered severely, and that the condition of certain portions is even dangerous. But, according to the undeniably authoritative opinion of those architects, the damage is not so serious as your correspondent describes it, and on the contrary, the preservation of the existing structure for hundreds, and perhaps thousands, of years is still possible. One thing only is necessary—viz., that

THE PROPOSED REPAIRS

shall be carefully and expeditiously carried out. The same conclusion has been arrived at

by the committee of Greek and foreign architects and archaeologists to whom the Greek Government has intrusted the task of superintending them. As the opinion of all these experts with regard to the mode of restoration shows few divergencies, the work might be taken in hand at once, those repairs being undertaken first upon which all the experts are agreed. Last winter a solid scaffolding was erected along the western portion of the temple, in order, first of all, to replace the specially damaged epistylum beams of the opisthodomus by new ones. The stones required for this purpose had in part been already brought from Pentelicon to the Acropolis, and the machinery obtained for raising these huge blocks, and work was about to begin, when war unhappily broke out and arrested the progress of operations. The funds for the work of restoration were granted by the Greek Archaeological Society, which derives its large revenues from a lottery sanctioned by the State. This year, unhappily, owing to the disastrous war, the lottery has hardly produced anything, and the Society has consequently no funds at its disposal to prosecute the works. The repairs have, therefore, been temporarily interrupted, and who knows when they may be resumed? For the Parthenon this is a deplorable matter, and the consequences may be most serious should a severe earthquake shake the mountain rock on which it stands. Your correspondent then proceeds to point out how excellently, since the erection of the scaffolding, the remaining portions of the celebrated frieze, the wonderful masterpiece of Phidias, can be seen and admired, and suggests in this connection whether it would not be better to place

THE FRIEZE ITSELF IN A MUSEUM,

and to replace it on the temple by a copy. That suggestion I heartily endorse. Not only are the marvellous works of a Phidias exposed on the temple to a gradual process of disintegration under the influence of weather, but in their present position they cannot be properly seen and appreciated. Now, for the first time, from the scaffolding which enables one to approach and study them at leisure, their great artistic merit stands fully revealed. If a modern sculptor or architect could set them up about twelve metres from the ground, in a gallery a little more than three (sic) metres broad, he might well afford to disregard scoffers and critics. And must we allow valuable Greek originals, numbered amongst the finest sculptures of the world, to perish slowly in a place where they might very well be replaced by copies? Your correspondent's assumption that the Greek Committee has rejected the suggestion lest it should seem to justify *ex post facto* Lord Elgin's spoliation of the Parthenon, is erroneous, for it was the English member of the committee who combated the proposal. Moreover, Lord Elgin's action has been denounced not so much because he conveyed some of the sculptures into safe keeping in London, as on account of the barbarous manner in which he destroyed some parts of the temple—e.g., the mouldings of the south side—in order to remove the sculptures. In conclusion, your correspondent rightly praises the Greek Archaeological Society for the “wonderful progress” made in Greece with regard to the care bestowed upon the antiquities of the country. Certainly those who, having seen the Acropolis and the other ruins, and especially the museums, twenty years ago, revisit them now, must be amazed at the progress to be witnessed on all sides. In Athens the ruins are protected from injury by iron railings, and the museums, which used to be described as stables, can stand comparison now with those of London and other European cities. This progress is undoubtedly due in part to the Archaeological Society, but chiefly and in the first place to Mr. P. Kavvadias, the Director-General of Antiquities, especially since he has combined the secretaryship of the Archaeological Society with the direction of the Antiquities Department of the Ministry. His energy deserves recognition, and your correspondent should not have omitted to mention his name.”

STROLLING SKETCHES.*

No. 13.

By R. A. EASDALE, A.R.I.B.A.

ABOUT SELBY AND PONTEFRACT.

ABOUT three and a half miles east of Monk Fryston stands the world-famed Selby Abbey—with its grand Norman nave, and examples of all styles—and that monstrous incongruity, the Classic balustrading on top of tower.

I don't know which is the stronger feeling on visiting Selby—the admiration of our older forefathers' work, or shame at the evidence of the bad taste of the Renaissance architects. At any rate, the balustrading has one use—that of emphasising the value of the twelfth, thirteenth, and fourteenth century work, and the utter incompatibility of Classic and Gothic work, notwithstanding Mr. Stratton's defence of Wren's attempt on the west front of Westminster Abbey.

I have only had time to sketch the west and east ends, and these rather on too small a scale. A student with a good glossary in hand could profitably study all Gothic styles at Selby; the west front alone showing Norman work pure and simple in doorway; then Transition in arcade over; then Early English in upper windows, with perpendicular tracery rudely inserted in central window. The east end, of course, is wholly Decorated. The typical custom of running arch molds down to sill, and forming the round molds into shafts, with small caps and bases, are here in profusion; also the over use of crockets and pinnacles is here apparent, many of these having failed to stand our merciless weather. I would draw the student's attention to the wonderful flowing lines of the tracery of east window; in fact, the whole of this monumental abbey church is so full of points of engrossing interest to all archaeologists that I earnestly recommend all young students who wish to visit Selby to make arrangements to stay some days there, for a cursory half day visit is quite hopelessly inadequate for even a glance round.

Leaving Selby, our northernmost point, and travelling direct south to Birkin, we come across, perhaps, the most interesting and valuable parish church of its kind in England. This remarkable tiny edifice lies far away from railways or main roads (it is $3\frac{1}{2}$ miles from any railway station), and only country lanes lead up to and past it. This is the only reason I can assign for its being almost unknown in the architectural world. If it had stood near London or in the Midlands no doubt its plan and details would now be figuring in every text book and glossary.

The origin of this church is, as usual, somewhat hazy. One theory is that it was founded and built by the Knights Templar, which famous Order was granted the manor of Temple Hirst, near Selby, by Ralph de Hastings—Temple Hirst being in Birkin parish. As the date of this grant is 1152, the probability is that Birkin Church was commenced before the grant. Another theory—and one more probable—is that the church was erected by Norman monks or handicraftsmen brought over by Ilbert de Laci, who, as I have mentioned before, was Lord of Pontefract Castle—1081—and who, no doubt, would be instrumental in causing such churches as Kippax, Ledsham, Darrington, Campsall, and Birkin to be built by these men in order, as we know, to follow out the policy of all the Normans, that by doing this they would propitiate and win over the outraged Saxons.

Another indication that Birkin sprang from Pontefract and not from Selby is that the plan of the ruins of the private chapel inside Pontefract Castle is on exactly the same basis as at Birkin in the apse end. This I will treat of later on.

The original Norman church in plan was as follows: Aisleless nave with west tower, square chancel terminating eastward in a semi-circular apse. The walls of nave, tower, and

chancel are unbuttressed, but the apse has flat pilaster buttresses, stopping under a corbelled eaves cornice.

This apsidal termination is very uncommon in England, and although there are a considerable number of apses to Norman parish churches, by far the largest number (both in England and Normandy) have square east ends. The idea that Norman churches always had an apse is a very common misconception—probably only about one in eight had an apse.

The geometrical setting out of plan is very interesting. The chancel is a square of 16ft.

square stones set angle-wise, a survival of the *opus reticulatum* of the Romans.

The apse is the most interesting part of the church. It is planned for a ribbed vault which remains, and is a very interesting and early specimen of an apsidal ribbed vault in a small church.

The apse is divided into five bays, two straight and three curved. A transverse rib crosses the apse, the west side of the rib being placed on the springing line of the apse curve. This (combined with the tangential circle setting out above mentioned) fixes the position of the vaulting shafts at the springing of

ALL SAINTS CHURCH, PONTEFRACT. R. A. EASDALE.

6in. internally. The apse is set out by striking a circle of 13ft. 8in. tangential with chancel square (inner face). Internal faces of nave walls nearly correspond with external face of chancel walls.

The nave is a double square to inner faces of north and south walls, and outer faces of east and west walls. Tower a square of half the nave square. Height from floor to springing of apse, the width of apse. You will notice that the plan of apse in Pontefract Castle has been set out in the same way as at Birkin.

The arches throughout at Birkin are semi-circular. Capitals show varieties of scalloped forms, many combined with angle volutes.

The date of the Norman Church is about 1140, or probably later.

The priests' door, south side of square chancel, has a lintol, with semi-circular relieving arch, the tympanum being solid, of

the apse, giving a width of 5ft. 4in. centre to centre of shafts. This 5ft. 4in. width was repeated for the side bays of the apse curve, leaving a much wider centre bay (7ft. 5in.), the centre window being wider inside than the north and south windows. From the vaulting shafts on the apse curve two ribs spring, which meet in the centre of the semi-circular transverse rib across the apse springing. This was a common form of early ribbed vault for small apses. A very early example of this occurs at Tewkesbury in the apsidal chapel on east side of south transept. Similar examples exist in Normandy: Gueron (Calvados), division of three (like Birkin); Petit Quevilly (near Rouen), division of four; St. George's de Boscherville (near Rouen), division of five. In all these cases the radial ribs abut against the centre of the transverse rib.

The earliest actually dated example of an apsidal ribbed vault in England is that of the

* Essay read before the Leeds and Yorkshire Architectural Society.

chapter house at Durham, built by Bishop Geoffrey Rufus (1133—1140), but it is of a more advanced plan than that at Birkin. The two first radial ribs on each side intersect in a key, and do not meet on the transverse rib.

The section of ribs at Birkin is three rolls separated by fillets. Earlier forms of Norman ribs: one big roll on a flat, as at Peterborough; or flanked by hollows, as at Durham; or two rolls, with hollows, &c., as at Peterborough and Gloucester.

The triple roll section both with and without the fillets between the rolls, occurs in the south transept vault of St. Cross, Hants. (late twelfth century).

The vault cells between the ribs at Birkin have a domical curve generated by the semi-circular label of the windows which serves as a kind of wall-rib, and the ribs themselves are

the result at Birkin must have been very striking and beautiful originally.

I am much indebted to Mr. J. Bilson, F.S.A., of Hull, for pointing out many of the interesting particulars of Birkin, and the similarity of the work with that in Normandy, where he has travelled and made careful study of the Architecture.

We will now examine the south aisle, which was erected by a lord of the manor (D'Everingham) in the latter part of the fourteenth century.

This addition entirely destroyed the symmetry of the Norman plan as well as the dominant idea of those builders—that of keeping the nave dark and the east end light. Two pointed arches, chamfered only, with hexagonal pillar between, separate this chantry from the nave. The design of tracery in

stained glass in several of the windows with heraldic and other devices.

I am sure you will excuse me for lingering over the description of this remarkable little church, but the place is so full of items of interest and instruction that it is difficult to know what to omit. There is a strong feeling amongst many students that Norman work is much below par; in fact, I have heard advice given that it is not worth while bothering to measure such work. I wish to protest against such advice. I have measured Early English work at York Minster, Skelton, and elsewhere, and have been duly permeated with a sense of the wonderful beauty of that style, but after I had spent twelve Saturday afternoons at Birkin with rule, plumb-bob, T-square, and pencil, and numberless evenings at home making the particulars presentable, I became

NORTH-EAST VIEW OF DARRINGTON CHURCH. R. A. EASDALE.

constructed on the advanced method of being actual groin ribs, and not the early method of being merely radiating ribs on the surface of the semi-dome. The vault of the narrow straight bay in front of the apse is a semi-circular barrel vault.

The whole construction of this apse vault shows no hesitation or bungling in its method. The ribs are in narrow stones throughout (as is usual in all Norman work), and the key in the centre of the transverse rib with the intersection of the two radial ribs is in one stone. The principal lesson taught by the better Norman work, especially in vaulted churches, is the absolutely logical method observed; especially the way in which the supports of arch and vault are designed to suit arch orders and ribs—a shaft to each order and each rib.

The general idea of the planning of Norman churches can be seen at Birkin notwithstanding the large fourteenth century south aisle, which lets in a flood of light. A dark tower-space, nave and chancel poorly lighted, and apse end one flood of light direct on to the altar; it is quite apparent that the dominant idea was to attract attention eastward, and

windows is very characteristic, and, for so small a church, ornate.

Of course, the extension southward necessitates the piercing of chancel wall by squint, and the magnificent Norman south doorway had to be removed and rebuilt. This doorway in itself is worth a pilgrimage to the spot to examine the carving, which in most places is quite fresh.

I was lucky enough to obtain two photos of the church, which represent the building as it was before restoration. Mr. Oldrid Scott in 1883 erected a new porch, and, I am glad to say, showed all the doorway; but it was found that the blundering, unsympathetic former erectors of the porch had destroyed part of these pellets, necessitating the insertion of new stone and modern carving, which has most capably continued the spirit of the old work.

The pulpit is a fair specimen of good Jacobean work with the regulation sounding-board above, and the font, though bearing the same date as that at Kippax, viz., 1628, is thought to be of very much earlier date, indeed, the work belies its date. I must not forget that there are some scraps of very early

possessed with a feeling of intense admiration for those clever architect craftsmen of the twelfth century. One cannot fail to be struck with the conviction that those men did in reality "design with beauty and build with strength." Every detail, every constructional item has its position accentuated by appropriate treatment. All the ornament is characteristically flat; to this, perhaps, we owe its wonderful preservation.

Examine the clever introduction of varieties of the scallop-work in all the caps. Every cap and nearly every neck mould is differently treated, the same remark applying to the pellets and the beak-heads. This spirit seemed also to enter the D'Everingham restorers, for all details in their work are diversified.

I ought to mention that lack of time only prevented me illustrating some of the characteristic corbels under the north eaves, which are a variety of well-known Roman forms, including the effective and simple axed work, and the clever treatment of flat surfaces on various planes. This beautiful and inexpensive mode of decoration is, I think, one of the best things taught us by Norman work.

Two instances occur in the church of the vandalism of the fourteenth century restorations, which prove that they were guilty of conduct such as we are unfortunately so often experiencing nowadays. Like the insertion of the perpendicular tracery in the west window at Selby Abbey, so the placing of the decorated work right in the centre of apse almost upsets one on beholding it for the first time. The destruction of carving on south doorway, mentioned before, is the other instance of that astounding disrespect for good work which is, alas, so slowly dying out.

I think you will all agree that Birkin is a church which well deserves a wider reputation. I know of no book which illustrates its beauties or chronicles its points of interest. But like many other worthy places, it has only to be known and seen to be appreciated, and I trust my feeble exposition of its value will in

south window, and the north-east window of the east end, and the perpendicular main east window—all these of themselves would be sufficient to stamp this wonderful church as almost without rival for its size.

A double black oak sedilia exists in chancel, with hinged carved misereres all complete, as modern specification would put it. The whole church has been recently restored by Sir A. Blomfield.

Ackworth, a village about three miles from Darrington, contains some picturesque stone domestic buildings of the last century. I show a sketch of one doorway. The lych gate to churchyard is modern, but not to be despised by the sketcher on that account.

Womersley Church, three miles south-east from Darrington, has a broach spire worth sketching, and other parts are not unworthy of study, but I have no notes on same, and it

stone on top of shafts of belfry windows (twelfth century work). In the view of the west front, the parapet and roof line appear to be wrong in perspective. That is not the case. There is a distinct fall of these away from the tower, whether due to pressure of the vaulting beneath or to counteract a possible settlement of the large tower, I do not know.

The whole village of Campsall is most picturesque, and would furnish worthy examples for the brush of a Waterhouse, Leader, or Herkomer.

A particularly lovely bit may be seen looking towards the church from the village. The fine elms and other trees are in themselves well worth a visit from these districts, where the proximity of trade seems to spoil everything beautiful in Nature.

If you visit Campsall, do not fail to go to Burghwallis, about one and a half miles south

SOUTH-WEST VIEW OF DARRINGTON CHURCH. E. A. EASDALE.

some measure increase the fame of the grand old place.

We pass Ferrybridge on our way from Birkin to Pontefract, with its little church of lowly pretensions. Somehow Pontefract sounds to a stranger like an old-world place, and I was very disappointed with its Architecture, in fact very little remains of its former glory, thanks to those unscrupulous Commonwealth men.

The old hall, one mass of ruins, is hopelessly in decay, and the old church has been patched up in transepts and crossing for divine worship. Of the once renowned castle, built in 1081 by Ilbert de Laci, and from whence all the churches in the neighbourhood owe their origin, only very few ruins remain. I have mentioned the curious fact that the plan of private chapel resembles that of Birkin. The masonry still extant shows most careful workmanship, the beds and joints being as good as when new.

Three miles south of Pontefract is another wonderful church, Darrington, which I believe was recently visited by our Society. The Norman Tower, with its belfry windows, the Early English south doorway, the decorated

is some years since I visited the place, so memory fails me.

Three miles south of Womersley, and six miles north of Doncaster, we come to Campsall. As the name implies, it was originally a Roman camp, many coins of that date having been found here. This place was also the scene of Robin Hood's famous exploit—the robbery of the Bishop of Hereford. The all-powerful Ilbert de Laci crops up again here, and no doubt he once more was instrumental in putting up this really magnificent Norman doorway and noble tower. The plan of this church is a complete miniature cathedral with nave, chancel, north and south aisles, and north and south transepts. There are evidences of a tower being originally intended at the crossing, but it was placed finally at the west end. An ancient rood-screen exists at the chancel, and at the west end of south aisle is a bay of domical vaulting, over which is placed a room, probably a library.

The happy grouping of the belfry windows and shafts and niches thereto is very striking. A noticeable late occurrence exists (as a survival from pre-conquest work) of the through

of that village. The church here is remarkable for the obliquity of its plan, the herring-bone walling, and the superb oak chancel-screen. It is curious that, whilst all the walling of tower and nave seems of one date, the axis of plan of tower is quite out of line with that of the rest of the church. I had only time to hastily sketch one bay of the screen, but you will gain some idea of its elaborate work from that drawing. The whole screen is about 10ft. 10in. high, and 15ft. long. The groined canopy work and the marvellous running frieze and cresting are well worth measuring.

There is no dearth of worthy buildings in the district to be studied. I know the difficulty of successfully carrying on sketching clubs, the reluctance of beginners to allow their seniors to inspect their first attempts, and many other drawbacks; but surely many must feel, as I do, that they would be able to improve very much if they had the opportunity of working alongside of men of superior attainments in this line, and a good sketching club in connection with this Society would, I think, in that way prove beneficial.

CHURCH ART AND ARCHITECTURE.

THE Church Congress held at Nottingham last week took a wide survey of matters pertaining to the Church. "Art and Architecture in the Service of the Church" was the subject under discussion at one of the evening meetings. The Rev. W. H. Draper, vicar of the Abbey Church, Shrewsbury, read the first paper. He said that, to any one who studied the history of Architecture, nothing was more striking than the way in which, as a matter of fact, it had shared in the mighty influence of the Christian spirit, and received from it certain characteristics which in their turn became fresh witnesses and agents of that spirit's life. The Christian religion counted nothing human as alien from its influence, but had within itself a power of eliciting new beauty and higher service from all kinds of Art natural to man. What were the points and principles to which attention needed most to be drawn? There was need of more personal intercourse and fellowship between the clergy and the artists. Another point that needed attention was the truth that all church buildings belonged to a living church, with its past, its present, and its future. They were not simply sacred relics, they were something more even than precious works of Art; they were the living instruments of praise and salvation. There was also a need that the public mind of churchmen should show more response so such new ideas and hopes as were stirring in the hearts of architects and artists of the present time. But the one supreme need of all was that of the spirit of enlightened sacrifice (the first of Mr Ruskin's "Seven Lamps") in the church at large, but especially among men of wealth. The heart could not but be quickened at the thought of what might be done when some of our great centres of commerce awoke to their noble opportunities, when the vast wealth now

WAITING TO BE CONSECRATED

was seen, not as a means of power chiefly, but as a possible means of glorifying God and uplifting man.—Sir William Richmond, in the course of his paper, said that leaving aside the classical period, for 400 years and more, from the eleventh almost to the seventeenth century, it seemed as though in Europe the production of an ugly thing was out of the question. In times of turmoil and bloodshed of the Middle Ages, and up to the culminating events of the Reformation, times of excess in vice, of excess in virtue, when there was little or no mediocrity to the front, Art flourished. The standard of taste was very high, but at the same time eminently spontaneous and fluctuating. Notwithstanding eager struggles for power, political complications, internecine wars, there was all through the life of the Middle Ages and the Renaissance a keen zest for the Arts of Peace as well as of war. Cathedrals, monasteries, and palaces were built, upon whose adornments the keenest intellects and the most crafty artisans expended their creative powers and skill. But the modern spirit, full of commercialism, differed from the spirit of ancient times, so appreciative of beauty. Contentment with the "commonplace"—aye, preference of it—had permeated every class and industry more or less, and had crept into the church, where one would have thought a spirit of "protection" would have been stronger than "free trade." There, as in our public buildings and in our houses, the tradesman was more evident than the artist; the commercial, rather than the creative instinct. In England soon after the Reformation, even as early as the reign of Charles I., her churches were destined to become little more than preaching houses, open on Sundays and holy days for the rhetorical display of big-wigged parsons. There was

NO MORE ART FOR THE CHURCHES.

Art in a church was like a red rag to a bull. It was a dull period, artificial in the extreme, a period in which it was impossible that any form of imaginative or decorative Art, especially of a religious character, should flourish. The father of modern romance, the real author of the Gothic revival, the most imaginative tender-hearted gentleman, Sir Walter Scott, by his poems first and then by his novels,

created a new romance. To him they owed the revival, or rather the beginning, of interest in romance. It bore fruit in the noble literature of this century, in the revival of interest in Gothic Architecture; and, directly and indirectly, Scott exercised influence upon the graphic Arts. In painting that most interesting revival, the Pre-Raphaelite, was an offshoot of Scott's genius. How was it that the most renowned painters of our time had been so rarely employed in the service of the church, while there has been so much opportunity presented in that direction? The Gothic revival naturally led architects towards antiquarian research. Hence there had arisen a clear definition of the styles of various epochs. To accommodate these it had been sought to permit no decoration in glass, sculpture, or wall-painting which did not belong to the style chosen—thirteenth, fourteenth, fifteenth, or of whatever century, Gothic or Renaissance.

sible, endured more wrongs and obliterations than even the cathedral churches. England shared with Russia, and with Russia only, the discredit and the misfortune of possessing no central power whatever to control the caprice or to instruct the possibly historical and artistic ignorance of dean and chapter or of the humbler rector.—The next paper, on "The Clergy and Artists' Association," was by Mr. Reginald Hallward, who said that this Association, which was opened by the Bishop of Stepney in May of last year, sought to establish the means through which those desirous of information in regard to the best work which was being done by individual artists might be helped in various ways towards obtaining it. The aim was to bring the clergy into closer relationship with the artist, to draw the artist into closer relationship with the church, and to strengthen and build up the service of Art to religion by directing employment into

CAMPSALL CHURCH, NEAR DONCASTER. R. A. EASDALE.

Surely it was not "style," but "styles," that were wanted; the expression of something that an artist had to say after his own fancy in accordance with such traditions as he had accepted. They would never get Art worthy of their religion until they cared for it and realised its great importance. They would never get it if they treated it as furniture.—Mr. J. C. Cox, F.S.A., said a double demand was made on architectural Art in relation to the church. At the present day their architects were called in to restore the old as well as to supply the new. With regard to the former, he held that irrevocable mischief had been accomplished in the past half-century, blotting out for ever,

IN CATHEDRAL AND PAROCHIAL CHURCHES,

many of the most interesting pages in stone of our ecclesiastical history. Some of our cathedral churches had suffered, too, from the rage for immense organ effects. The average ancient parish church of England had, if pos-

sible, endured more wrongs and obliterations than even the cathedral churches. England shared with Russia, and with Russia only, the discredit and the misfortune of possessing no central power whatever to control the caprice or to instruct the possibly historical and artistic ignorance of dean and chapter or of the humbler rector. The aim was to bring the clergy into closer relationship with the artist, to draw the artist into closer relationship with the church, and to strengthen and build up the service of Art to religion by directing employment into the hands of the most gifted. He had long thought that an order or community of artists on a definitely religious basis, endowed with funds to send out young artists relieved from all direct money responsibility, supported by the community during the work out of its funds, and in return accepting the restraints which a definitely religious basis must impose on their life and conduct, would have enormous advantages. They said, "Go direct to the artist, and we will help you to this." Not half the artists that could do beautiful work in churches were employed in this direction; but then they did not advertise in the church papers, and the public said, "We do not know where to go." This evil, at least, this Association could help to overcome if the clergy and the public would help also.

THE Palais des Champs Elysées, in which during many years the French Salons have been held, has now been entirely demolished.

THE REAL "OLD ENGLAND."

QUAINT LÜBECK.

NO one of late years seems to have suggested that Old England might be a pleasant and interesting country for an Englishman to be acquainted with. After a short sea trip to the Hook of Holland, a railway journey across Westphalia and Hanover to Hamburg takes you through ancestral England, on whose border lie the two famous free Hansa towns of Hamburg and Lübeck. Hamburg is now one of the most modern of towns, the greatest commercial town of Germany, and, since the great fire of fifty years ago, its ancient dignity has to a great extent disappeared. But Lübeck, once the capital of the mighty League of Northern Germany, is to be ranked with Bruges and Nuremberg as one of the towns of the world where the majesty of the past can be fully felt. A mere walk through its streets is an impressive object lesson in what mediæval architects—even though, as here, restricted to the use of brick—could do in the building of walls and gates and towers. Looking up at the mountains of brickwork which rise into vast spires over the two great churches, one feels with our own poet that "They

DREAMT NOT OF A PERISHABLE HOME

who thus could build." Lübeck has its sights, and many and varied they are. There is the wonderful Memling in the cathedral; the mechanical clock, with its quaint procession of Apostles, in the Marien-Kirche; the city gates, the Holstenthor and the Burgthor, massive structures which tell of the day when Lübeck was worth sacking; the Rathhaus, with its splendid staircase and council chamber; the town museum, with its wonders of Gothic Art and its wooden statue of St. George galloping over the dragon with the princess kneeling beside him, a miracle of fifteenth century Art; and, finally, the quaint, high stepped gable houses, some barbarously modernised, but many still left in their original native brick—grand and solid old houses behind whose solemn fronts, in panelled rooms, the old Hansa merchants lived in substantial comfort and quiet dignity. The few English people who go to Lübeck make straight for the Memling and the clock; not many turn out of the Breitestrasse into the doorway of the Shipping Guild, unless, being thirsty, the legend "Münchener Bier" beneath one of the windows catches their eye. Being in, however, they find themselves face to face with the sixteenth century, for

THIS VAST, BEWILDERING HALL,

with its tremendous beams, its panelling, its pictures, its antique models of ships hanging, and a thousand and one other quaint objects, is an untouched interior of the year 1535. As it was when, in the days of our Henry VIII., the ship owners and merchants used to assemble here to discuss the business of the League, so it is now. The interior of the Schifferhaus must be allowed to grow upon the stranger after several visits. It is a place which requires long hours of calm inspection, for when the eye gets weary of contemplating the quaint ships and galleys—every one of them worth its weight in gold to a marine historical painter—it finds relief in the curiosities hanging alongside of them, the statue of the Greenlander in his original Kayak as he was found, "dead in the ice, near Travemünde, in 1668." Hard by is a carved and painted whale swallowing a reluctant Jonah. Revolving lanterns and a splendid old brass chandelier hang from other beams. Above the oak wainscot of the room is

A BEAUTIFULLY CARVED FRIEZE

of pierced panels, and above that curious ancient pictures, stretched upon the wall, with long rhyming inscriptions beneath. Looking lower are seen the bench ends, carved with ships and heraldry, the ships of the League as they were in the days of the beginning of the League in the thirteenth century, the arms of various towns with supporters, men in armour, lightly-clad ladies, and monks. Down at the far end of the room

is a dresser, on which are some curiosities of later days—last century pewters, and flagons, and dishes. Upon the supporting column hang pictures of ships of 1560, one of them named the Eagle—in the original frames in which they were placed on completion for the Guild—accurate portraits of the famous vessels of the Hanseatic League, whose flag, even at that time, when its power was waning, was seen in every northern port. The lower part of the column bears the date 1535, and it and its fellows are as sound and as strong as ever, good heart of oak such as the ships of the League were built of.

THE SIR GILBERT SCOTT
COLLECTION OF ARCHITECTURAL
DRAWINGS.

PROFESSOR BANISTER FLETCHER had a very pleasing announcement to make at the prize distribution at King's College on Thursday. We give the Professor's report:—Since the opening of last Session I have to announce a very valuable gift to the Architectural School of this College. By means of correspondence between Mr. Banister F. Fletcher and Mr. W. S. Weatherley, F.R.I.B.A.—a pupil of the late Sir Gilbert Scott—the whole of the original diagrams and drawings prepared by the late Sir Gilbert Scott, R.A., and his pupils, and numbering some 400 drawings, have been presented to the College, to be under the care of the Professor of Architecture. The drawings were originally prepared as illustrations for Sir Gilbert Scott's world-famed lectures at the Royal Academy, and I need hardly say that their value is exceedingly great. In the collection are many original drawings by Sir Gilbert Scott himself, and by his pupils and others, including George Edmund Street, R.A., J. G. Jackson, R.A., W. S. Weatherley, &c., &c. To show you the extraordinary value which Sir Gilbert placed upon these lecture diagrams, I quote the following from his life:—"If they were not good diagrams it was not for want of pains, for I did all in my power to render them so, and am vain enough to believe that they contain

MUCH THAT IS ORIGINAL

and meritorious. They were most elaborately illustrated by bold chalk sketches and drawings; on these I, my sons, pupils, and assistants worked most assiduously. On one occasion I actually went into France on a special sketching tour in December to get materials for my lecture. A nobler set of illustrations was probably never seen at any lectures. They numbered on one occasion upwards of seventy, and far more than covered an entire side of the great room at the Academy. There were many of them from sketches made expressly for the occasion, some were sketches obtained from others. Very many were enlarged

FROM MY OLDER SKETCH BOOKS,

and some were taken from published works; indeed, every source was laid under contribution to make my lectures thoroughly explanatory in every way." The donation has been made by his son, Mr. John Oldrid Scott, F.S.A., and the thanks of the College are heartily due to him for the gift; besides, it will be an appropriate memorial of one of the most eminent of English architects of all times. Many of the drawings are hung round the room, but, of course, there is not space for a tithe of them. The only thing we have to ask the Council to do by the terms of the donation is to provide suitable accommodation, and a certain outlay on repairs to the drawings. With the collection already belonging to myself, and which has been collected and gathered in from all parts of Europe, and from private and individual sources, it forms a collection which I do not hesitate to say has no rival, or anything approaching a rival, in the whole of the civilised world. I cannot leave the subject without again referring to the debt of gratitude on behalf of architectural education we owe to Mr. John Oldrid Scott and to Mr. Weatherley for acting so kindly on behalf of the college. I should also say that Mr.

Weatherley has given the whole of the original drawings which he made for the illustration of Scott's well-known lectures on Architecture, which are in published form, and well known to all architectural students.

PAVING OF LONDON STREETS.

SOME particulars as to the paving of the metropolis are given in a contemporary. The modern history of the London pavement commences with an Act passed in 1533 for paving the road between the Strand Cross and Charing Cross—that is from opposite the modern Somerset House to Charing Cross. The distance between the Strand Cross and Temple Bar had been previously paved, the "great comfort" of which was set forth in the Act. The expense of the paving was to be borne by the individual proprietors, each being bound to pave in front of his own house under a penalty of sixpence (equivalent to about six shillings of our present currency) for each square yard of pavement not laid down or not afterwards kept in repair. In the next year another Act was passed, setting forth that Holborn, the great road to the west and north-west parts of England, was formerly well paved, but had become "noyous" and dangerous, and directing a pavement to be made from Holborn Bridge to Holborn Bars by the inhabitants, as in the former Act; but the penalty for not maintaining the pavement in repair was extended to all London and its suburbs, particularly to Southwark, and lessees were empowered in paying their rents to deduct money expended in paving. In 1541 an Act was passed for paving the street from Aldgate to Whitechapel Church, from Holborn Bars towards St. Giles (as far as there were contiguous habitations on both sides of the way), Chancery Lane, Fetter Lane, Shoe Lane, and Gray's Inn Lane, "in the same manner as from the

STRAND BRIDGE TO CHARING CROSS

is now paved." In the City the Mayor and Aldermen are empowered generally to enforce the Act, and are themselves made liable to a fine of £5 if they neglect to do so. The next Act was in 1545, and it directs the paving of Whitecross Street, Chiswell Street, Golden Lane, Grub Street (Milton Street), Goswell Street, Long Lane, St. John Street (Smithfield), Water Lane (Fleet Street), Wych Street, and the Strand from Temple Bar to Strand Bridge, Fosse Lane (near Strand Bridge), the Street Without Bishopsgate Street, and Petty France (now York Street, Westminster). In this Act the penalty is increased to twelve pence per square yard, and magistrates are liable to the penalty of £5 for neglecting to enforce the Act. The next important Act on the subject of paving bears date 1603 (3 James I.). This was for the paving of the road from St. Giles down Drury Lane to the Strand, and also towards Wych Street. Smithfield was paved in 1613, and about the same time broad free-stones began to be laid down for the accommodation of foot passengers. After the Great Fire in 1666, all proprietors in the City were ordered to lay down flagged pavements 6ft. wide each before his own house, and the rest of the street to be paved "causey" fashion, or raised in the middle. The modern system of rating the inhabitants, instead of compelling them to do the work themselves "each before his own house," commenced with the Act 13-14 Charles II. (1661-62) for the Repairs of the Pavement and Regulation of the Streets of the Metropolis, which set forth that they had been for some years past miry, foul, and noisome. The Commissioners appointed by this Act are directed to pave St. James's Street, Pall Mall, the Haymarket, and part of Piccadilly to Ayr Street, for doing which they are empowered to charge on the inhabitants each for the frontage of his dwelling 16d. per square yard of pavement; and the repair of all pavements generally is laid on the inhabitants in the same manner, subjecting them to a penalty of 20s. per rod (5½ yards) until the defect complained of shall be remedied.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

October 6th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

The rapidly growing popularity of St. Albans as a residential suburb, and consequently the great demand for building sites, is exemplified in the fact that a site of nearly four acres, which was only opened up as recently as March last, has all been disposed of within the short space of six months. Not only has the land been sold, but there are already about a dozen houses in the course of completion, the majority of which are being carried out under the direction of Mr. Percival C. Blow, architect, of St. Albans. The estate is known as "Gombards Estate," and, with the exception of about seven plots, has all been sold by private treaty, none fetching less than about £2 10s. a plot.

SPECIALISTS in Athenian archaeology have been devoting much attention of late to the vestiges of the ancient temple of Athene on the Acropolis, the predecessor of the Parthenon, which stood on the site occupied by the ruins of the Erechtheion. Dr. Dörpfeldt has always maintained that the old temple was never completely destroyed, and fragments have been discovered which it is believed belonged to the statuary in the pediment of the building, including the figure of Athene, minus the arms, and three torsos of giants. It is hoped that enough of the group will be recovered to indicate its nature and leading features. It was this old temple that contained the miraculous statue of the goddess, the olive tree she caused to spring from the earth, and the spring which was called forth by a stroke of the trident of Poseidon. It was the shrine of the sacred hill and the goal of the Panathenaic procession.

THAT thickly populated quarter of modern Athens known as Anaphiotika has come into the hands of the Greek Archaeological Society. As the newly acquired blocks stand in the immediate vicinity of the Acropolis some specially good finds are expected, and excavations are to be proceeded with at once. Although the British School at Athens is doing good work, it is unfortunate that we have to depend upon the learned societies and journals of Germany for the greater part of our information concerning the work done by the archaeologists. An official account of the work done in the neighbourhood of the Acropolis has been published in modern Greek by the Athenian Ephor of Antiquities. Cannot the British school send us an English version? The excavations are said to throw considerable light upon several disputed points in the Ion of Euripides and the Lysistrata of Aristophanes.

THE Church of St. Martin's-in-the-Fields is almost as well known as the Nelson Column, the National Gallery, or Trafalgar Square itself. It has the proud distinction of being the Royal Parish Church, her Majesty the Queen, the Prince of Wales, and the Duke of York being all dutifully inscribed on the roll of parishioners, together with many less illustrious names. After having been closed for

three months, the spacious old church was re-opened last week. Sir Arthur Blomfield, R.A., shortly after the Jubilee, had taken in charge its interior decoration to excellent purpose, endeavouring, by the introduction of light and colour, to brighten the harsh and stiff old Georgian walls.

VERY soon, it is to be feared, it will be possible to number on one's fingers the links in the City of London that connect the past and the present. We have it on the authority of a correspondent that no less memorable a house than the tavern at Pie Corner is coming under the hand of the improver, and is about to be demolished to give place to a more modern structure. There it was that the Great Fire ceased to burn, and the present house, which, by the way, is Corporation property, was erected on the site. It is an interesting old house, containing several relics of bygone times. For instance, relegated to the coal cellar is a huge beam (to which is attached an iron bracket) which was formerly part of the house standing there when the fire raged about the spot. Fastened to the cellar wall, also, is a curious old-fashioned coffee-mill, long too rusty for use. Mention may further be made of the existence on the topmost floor of a door in one of the walls. This is regarded by the inmates of the house with something akin to awe, for it not only leads "somewhere," but is covered on the outside with large strips of iron placed crosswise. To the man in the street, however, the most interesting feature of the building is the effigy of a "naked boy," which was placed over the door soon after the fire, and which bears an inscription to the effect that the fire was a judgment on the people for the sin of gluttony. Some little time back the figure was removed, but recently it has been reinstated, plus a thick coat of paint, which entirely obliterates the inscription. A very good suggestion has been made, viz., that if the house comes down, the effigy should be secured for the Guildhall Museum, together with that portion of the beam which is said to be scorched.

THE need for proper art gallery accommodation seems to be generally appreciated in the manufacturing towns. Bradford must now be added to the list of centres of population in which dissatisfaction is felt with the present inadequate arrangements for the exhibition of works of Art. A scheme has been prepared for the erection there of a municipal gallery which would compare favourably with other buildings of the same class in the midland and northern counties. The site on which it is proposed to erect the gallery is the property of the Corporation, and the cost is estimated to amount to about £10,000. If the scheme is accepted by the Corporation, Bradford would enjoy the advantage of possessing an institution on a larger scale than that already existing at Birmingham, and excellently adapted to the requirements of the district.

DICK'S COFFEE-HOUSE—an interesting remnant of old Fleet Street—will soon disappear. There may be doubts whether it is the actual building where, in the last century, Dr. Johnson and his wits, poets, and politicians assembled, for within the last forty years this historic quarter has seen many structural changes. But if the hotel is not the famous original, it is about three centuries old, and stands in the immediate locality. Having an unpretentious exterior, it is entered by a long narrow passage where two persons cannot walk abreast; and the contrast between the noise and bustle of the street and the quietude and repose of the coffee-room is striking. It is a large chamber, with oaken beams on the ceiling, and looks into Hare Court, with its trees and its conduit, once a pump. Hidden on the north by Butterworth's, the law publisher, perhaps the oldest shop in Fleet Street, and on the west by the quaint wooden Elizabethan houses at Middle Temple Gate, formerly known as "the old post-house." Here it is said the business of a law stationer has been carried on, as now, for 200 years. It is apt to be ignored by the passing wayfarers. The door of Dick's has now been finally closed, and the ancient

edifice will speedily be razed to the ground to make way for the wants of an adjoining assurance office.

"ARCH ROCK" is one of the most conspicuous objects in San Francisco Bay. Situated just one mile due west of Fort Alcatraz, it separates the north and south channels of the harbour. Above the water-line the dimensions of the rock are small. Its height above low tide is but 26ft. and its length about the same. An arch about 12ft. in diameter, through which small boats sometimes pass, has been worn through the middle. Below water the rock expands gradually, so that in order to obtain a uniform depth of 30ft. at low tide, as is contemplated by the engineers who have contracted to remove this obstruction to navigation, a bulk over 300ft. in diameter must be removed. The engineer, Mr. Otto Von Geldern, who has been making the preliminary surveys of the rock, has made sectional drawings of it. The rock is soft sandstone, and easily disintegrated by explosives. The plan recommended by the engineer is to drill holes to the required depth and charge with dynamite. Drills can be operated either from boats or from stationary platforms resting upon the face of the rock, and adjustable for all depths, and easily operated at all stages of the tide or conditions of the weather. The softness of the rock will permit rapid progress when the work is begun. Not more than two seasons will be required for preparation, and one blast, it is calculated, will utterly obliterate the rock as it now stands. The engineer calculates that 40,000 cubic yards of rock must be removed in order to attain the required depth of 30ft. at low tide. The plan pursued in blowing up the rocks at Hell Gate, New York Harbour, was considered, but the engineer believes that the work can be quite as effectively performed and much more cheaply by drilling from the exterior.

It is now announced that among the probable features of the Paris Exhibition of 1900 will be an exact reproduction on a large scale of one of the most characteristic buildings in Moscow, the church of Vassili-Blagennoi. This edifice, which is better known to western tourists as Saint Basil's Church, was erected towards the middle of the sixteenth century by order of Ivan the Terrible in commemoration of the conquest of Astrakhan. Its chief originality is the eleven towers by which it is surmounted, the towers themselves being capped by metal domes resplendent with gold and silver burnishing and painted in the most brilliant colours. Legend has it that when the church was completed Ivan the Terrible had the architect called into his presence and asked him whether he was capable of producing another building equally beautiful. On his replying that he was, the Tsar at once had the unfortunate man's eyes put out.

OWING to the great inconvenience caused to the public by the frequent opening up of the roads in London for various purposes, the Strand District Board of Works has issued a circular to all Metropolitan vestries and district boards, suggesting joint action, with a view to reducing the inconvenience. It is pointed out that at present the gas and water companies have the power of opening up nearly all the London streets at any time, subject only to their afterwards making good the roadway. The board suggested that the authorities it has circularised should join in asking the London County Council to insert a clause in its next General Powers Bills making it obligatory on London gas and water companies to give due notice to the parish authorities before opening up any road, and giving the parish authorities the power of vetoing such opening.

THE Glasgow Art Galleries, of which the foundation-stone was laid the other day by the Duke of York, promise to be the finest in the kingdom. The rooms, for the most part, range between 90ft. and 100ft. in length; and, while some are as much as 65ft. wide, the majority have a width of 35ft. The exterior is severely classic in treatment, but with a

free use of Renaissance details. The buildings will cover an area of nearly two acres. Glasgow has, singularly enough, shown this year, by the high honours she has taken in the National Competition of Schools of Art, how a Fine Art gallery will be appreciated; for she heads the list, beating Birmingham, which is usually *facilis princeps*, by a single prize and equalling her in the gold medals.

STATUES by the score have been inaugurated during the past two months in France. A single paper names the following as having been unveiled in a fortnight:—Two to Carnot, at Limoges and Annecy; at Valence two, one the work of the Duchesse d'Uzès; at Péronne one to Marie Fouré, a legendary heroine akin to Jeanne d'Arc; at Châteauneuf one to the Provençal poet Anselme Mathieu; at Orange one to the architect Caristie; and at Grenoble one commemorative of 1788.

THE demolition of a section of the Hanover Buildings, Tooley Street, immediately facing the southern end of the Tower Bridge, is in progress, and is the first indication of the commencement of the new roadway which is to be made by the London County Council extending from the Tower Bridge to the Old Kent Road. The local authorities are being approached by the County Council with a view to obtaining their consent to the new thoroughfare being lit with the electric light and to apportioning the charges to the several parishes.

A CURIOUS complication appears to have arisen in regard to the proposed removal of coffins and human remains from vaults beneath the old Church of St. Mildred, Bread Street, City. During the repairs, which have been in progress since the autumn of last year, some human remains were discovered, and the City medical officer (Dr. Saunders) reported the matter to the Home Office authorities, who eventually caused an Order in Council to be issued requiring the churchwardens to remove the remains forthwith to Woking Cemetery. But the medical officer reappeared on the scene, and on sanitary grounds it was decided to postpone operations over the summer until October. Meanwhile the Bishop of London's advisers pronounced the Order in Council to be invalid, as the space under the church had long ceased to be used as a "burial place." Between the Home Office and the Diocesan Chancellor the churchwardens were in a dilemma, but have now decided to apply forthwith for a faculty so that they may be safeguarded by the possession of duplicate warrants.

THE annual exhibition of drawings and paintings by students of St. Martin's School of Art in Castle Street, Long Acre, is now arranged. As on former occasions there are some good designs, notably those of Miss Thomassin, who adapts floral forms to artistic patterns for tiles, borders, &c.; Mr. R. Crooke, also successful in floral and figure work; Mr. A. Vaughan, with skillfully drawn ornamental device; and Mr. C. Twohey, whose panel and ceiling designs are in the manner of old French decoration. Exemplary patience in the study of early work, of different countries and periods, is shown in some museum studies by Mr. Watkins, who evidently understands beauty of line and colour. The chalk work from life comprises some strong heads with character about them, by Mr. F. Anderson; another is by Mr. C. Westlake; and one of a girl, manipulated with much refinement, is by Mr. John E. Allen, who for the past several years has acted as headmaster of the school. A prominent feature amongst the subjects of instruction is designing for carriage building.

A QUITE pathetic appeal was made to the Devonport Town Council by the deputation which waited upon it in opposition to the proposed site for the Great Western goods station. It would gratify the æsthetic taste of a Ruskin to find in a utilitarian community like Devonport a body of men anxious to save from the hand of the spoiler the "beautiful neighbourhood" in which they live, and advancing as a reason for opposing a railway scheme the

argument that that neighbourhood is "one of the few places left to lend a charm to the suburbs" of the town. With practically the whole of the foreshore devoted to the dock-yard and its appurtenances, and a large area of the town covered with barracks, Devonport can never hope to be particularly attractive as a place of residence. There is thus all the more reason for preserving a suburb like Stoke, which is not without its charm.

TIMBER is cheap to-day. The circumstance appears worthy of record that many of the great beams that were put up to strengthen verandahs and other structures along the route of the Jubilee procession still remain in position, standing, stripped of their decorations, as gaunt reminders of the event of a lifetime. The reason of this apparent waste of good wood is that the labour required to remove it costs more than the value of the material, and the householders who had the shorings put up, having forgotten to contract for their taking down, find themselves inheritors of unsightly and unprofitable oddments and impediments of which they cannot rid themselves except at considerable expense.

THE question of rebuilding and removing Christ's Hospital—known to most Londoners more familiarly as the "Blue Coat School"—has been so long about that the laying of the foundation-stone of the new buildings at Horsham this autumn will come as a surprise to many. Defeated in their endeavours to keep their old "alma mater" in town, some of the old Blues have conceived the idea of rebuilding the now historical hall on the Sussex site. This hall, the scene of so many commemorations and school incidents, is the imposing Gothic building seen from Newgate Street. Although, however, it looks so ancient, it really only dates from some sixty years ago.

MR. RALPH THOMAS, of Clifford's Inn, writes protesting against the proposed granite parapet to the river front of Battersea Park. "Anyone who wishes to see how utterly all the ever-varying interest of the river can be blocked out by a granite parapet has only," he says, "to take a seat on the Thames Embankment, when he has a fine view of stone pavement, granite wall, and tops of houses on the opposite side. Now let the spectator go to the Tower Gardens, Greenwich or Blackwall piers, or the Royal Victoria Gardens at Woolwich, and see the difference. Instead of dull dreariness of walls, you have life, animation, and beauty of the river, with its numerous craft. Imagine the Parade at Brighton with a nice granite parapet!"

RAPID progress is being made with the demolition of the iron buildings known as the "Brompton Boilers," and in a few weeks nothing will remain of this, the oldest portion of the South Kensington Museum. "The Boilers," which were erected more than forty years ago, were first opened to the public in June, 1857. No one will regret the destruction of these unsightly buildings, whose removal will be followed, it is hoped, by the erection of the long-promised new frontage to the museum.

AN interesting discovery has been made on Barningham Moor, the property of Sir F. A. Milbank, Bart. One of the highest points of the moor is called "How Tallon." Quite on the summit of the hill is a mound, about 60 yards in circumference and 6ft. to 7ft. high. It was decided to open this mound, and accordingly a trench was made on the south-east side, and before a yard of earth had been removed human bones and fragments of a skull came to light. Proceeding gradually towards the centre, the loose character of the soil gave indications that a further find was in store, and near the top of the mound a stone cist was discovered. This had contained a human body, but owing to pressure from above, from a wall which was built over the mound, the remains were lying outside the cist. It was impossible to be certain whether the body was in a sitting or lying posture, but most probably the former. The skull was much broken but

the jaw and teeth gave evidence of an old man. Among the bones were four flint arrowheads and a flint scraper. Two of the arrowheads were very remarkable specimens, one of the barbed variety, and the other leaf-shaped. The edges were exquisitely serrated and most delicately made. A small pottery urn, much broken, was also found with the body, and this had a finely-worked pattern on it of small triangular form.

MR. R. M. BUTLER, architect, Dublin, has written protesting against "the extent to which it is the fashionable custom to call in English or foreign architects to design works in Ireland to the detriment of their professional brethren here." He proceeds: "I give a list of a few important works in progress which will serve to show how grave a slight is placed upon the Profession in Ireland by building owners, undoubtedly to their own loss. A stranger cannot have the same facility in dealing with the building problems of this country as would one who has spent his professional career in becoming acquainted with the possibilities of its building materials, and who is thoroughly familiar with the social conditions of his own country. Needless to say, a man coming over to design a solitary building is out of touch with it; and to expect from him any active sympathy with a struggling native industry would be absurd. The following are some of the works I refer to:—Messrs. Power and Son's Distillery; Mr. Carøe, architect to the Ecclesiastical Commissioners, London. Mr. John Jameson, residence at Howth; architect, Mr. Darbyshire, Manchester. New Theatre Royal; Mr. Frank Matcham, London. Mr. James Talbot Power, works at Leopardstown; architect, Mr. W. D. Carøe. Lord Carysfort, new church at Arklow (cost over £25,000); Sir A. Blomfield, London. Lord Iveagh, new buildings at Farnleigh, Castleknock, and St. Stephen's Green; architect, Mr. William Young, London. New Hotel, Sackville Street; English architect. Kilkenny Cathedral; Sir A. Blomfield. I need scarcely say that in the remarks I venture to offer I have no desire to include such English architects as have honoured us by taking up their residence in Ireland. The practice I refer to is equally a slight on them."

THE most picturesque portions of the Old Bell Inn, of Holborn, have endured since 1521. Their doom has now been pronounced, and an auctioneer was last week engaged in selling the furniture and effects. Memories of Dickens, Thackeray, John Leech, Mark Lemon, and others are associated with this ancient hostelry. No doubt in the old days stage plays were enacted in the yard, and there is a tradition (which is picturesque, even though it may not carry the weight of Mr. Furnivall's authority) that this was the scene of one of Shakespeare's own performances. Mr. William Black's readers will not need to be reminded that Queen Titania, Bonny Bell, and Count Von Rosen lunched there before the phaeton started on its strange adventures. The Uhlan, it will be remembered, spoke of "the old-fashioned air of homeliness and comfort noticeable in the inn, of the ancient portraits and the quaint fireplace, and the small busts placed about." Mr. Black's description of the "frail and dilapidated galleries" is not applicable to their present condition. But the first story floors are anything but level. Creepers still hang from the galleries.

IN the report of the vestry meeting of the parishioners of St. Mildred, Bread Street, and St. Margaret Moses, a remark was made by one of the speakers to the effect that in a few years time in all probability the site of the parish church will be sold. Such a suggestion requires to be promptly nipped in the bud, and the City Church Preservation Society and all lovers of Wren's Architecture will, it is to be hoped, take immediate action in order that when the attack is made it may be met and successfully combated. It is admitted that the church merely encumbers the ground from an ecclesiastical point of view, but for this position of affairs to be regarded as any argu-

ment in favour of demolition must not be countenanced for a single moment. The connecting links between the past and the present are disappearing all too quickly by the hand of the improver. All the more necessary, therefore, is it for the lovers of the past to unite in resisting any attempt at vandalism such as that suggested by the proposal to remove one of Wren's grandest churches.

MARKS HALL, near Kelvedon, is to be offered for sale at the London Auction Mart on October 14th. The manor of Marks Hall was held at the Conquest by Nigel under the Montforts, then by the de Meres or Merksalls (whence the modern name). This powerful family held the manor for 500 years; then ceded it to the Coles, who passed it to the Deraughs, from whom in 1605 it was purchased by the Honywoods, the present owners. While the new possessors in the early days of James I. found it necessary to rebuild the ancient structure, they preserved such of the more recent additions as were substantial, the Tudor gateway and parts adjacent. The main body of the manor-house belongs naturally to that hybrid period which partakes both of the Elizabethan and Jacobean types. Thus even in the entrance hall we have the high oak wainscot, old oak chimney-piece, and open fireplace, with dog irons; yet we have a comparatively wide oak staircase, to which the corridor screen of the hall serves as staircase screen. The internal arrangements underwent considerable modification at the commencement of the Georgian epoch of architecture. The situation of the house on high ground renders it probable that the most ancient existing portions do not antedate the early Tudor period. The mansion, which is approached by a carriage drive winding through the undulating and well-timbered park, contains, in addition to the fine old entrance hall, a pleasant breakfast-room, a well proportioned, hexagonal-shaped dining-room, a handsome drawing-room and library, together with fourteen principal bed and dressing-rooms and eight secondary sleeping apartments, a lantern-lit billiard-room, and an ample set of domestic offices.

FEW artists of great distinction have had their personality less frequently paraded in public than Mr. Holman Hunt, whose picture, "Gloria in Excelsis," was last week exhibited at Nottingham in connection with the Church Congress. Mr. Hunt, who lives at Draycott Lodge, Fulham, but is rarely seen in town now, was admitted a student of the Royal Academy in his seventeenth year, and two years later sent his first picture to the exhibition of that institution. In conjunction with the late Sir John Millais and Dante Gabriel Rossetti, some forty-six years ago, he introduced what is now universally known as the pre-Raphaelite style of treatment, one of the most powerful literary champions of which was John Ruskin. Mr. Holman Hunt was born in London seventy years ago, but in what month of 1827 no one appears to know.

THE last of the great suspension bridges across the Niagara gorge is about to be taken down, and workmen are now busy preparing for the erection of a second steel arch to span the chasm, where for many years the suspension type of bridges held undisputed sway. The final structure to be removed is the bridge close to the State reservation and falls. It has the longest span of any of the Niagara bridges, and the arch that is to replace it will be one of the most notable structures of its class in the world. With the construction of this second arch, this style of bridge will share with the cantilever the honour and credit of transporting all travel across the gorge, while it will also define a most wonderful advancement in bridge building. The proposed arch especially referred to will be the fourth bridge to be erected on the site. The abutments for the arch have been built for over a year. They are four in number and stand close to the water's edge on either side of the river. Each abutment will support one leg of the bridge. In preparing for their construction the accumulated rock and loose dirt of the banks were

excavated by hydraulic means until a solid rock foundation was reached. On this foundation of rock a concrete foundation was built. From cliff to cliff at the point where the bridge will stand the distance is 1268ft., and the span proper of the arch will be about 840ft. In width it will be a little over 49ft., the present structure being but 17½ft. It will be of the single deck pattern, and about 23ft. of the centre will be devoted to trolley tracks, while carriage-ways will be on each side, beyond which will be elevated walks for pedestrians. Located, as this great arch will be, close to one of the natural wonders of the world, it is destined, no doubt, to attract much attention, not only while in building, but in its finished state.

ALTHOUGH the restoration of the old Priory Church of St. Bartholomew the Great is practically completed, further portions of the original building are still being found. During the last fortnight some 20ft. of the exterior wall of the north side of the Lady Chapel have been uncovered. This wall will now be left permanently exposed. The building, and especially the Lady Chapel, which was opened last May, continues to attract large numbers of visitors. During October the whole church, including the crypt, will be thrown open during the afternoons of October 9th and 16th, and the points of interest will be explained by one of the honorary secretaries of the restoration fund.

THE committee responsible for the carrying out of the work of erecting suitable memorials in the Isle of Wight to the late Prince Henry of Battenberg has received an important communication from the Society for the Protection of Ancient Buildings, which will, in all probability, retard the work the committee has in hand. The memorials decided upon were two. The first was the conversion of the ancient gatehouse and Portcullis Chamber of Carisbrooke Castle into a museum for the reception of articles of interest connected with the Castle and Isle of Wight. The other memorial was an addition to Carisbrooke Church. Sir Charles Seely, Bart., formerly M.P. for West Nottingham, offered the sum of £1000 towards the second memorial, providing that at Carisbrooke Church a chancel should be built on the site of the one formerly said to have existed at the church. The memorial at Carisbrooke Castle is almost completed, and has given great satisfaction to those who are responsible for the work. With regard to the memorial at Carisbrooke Church the Committee of the Society for the Protection of Ancient Buildings has interposed, and the secretary, Mr. Thackeray Turner, has addressed an important letter to the secretary of the Battenberg Memorial Committee on the subject. The committee expresses the hope that the rumour as to the destruction of the ancient chancel arch is unfounded, as in its opinion it would be an unjustifiable act of vandalism. Carisbrooke Church, it points out, is so well known, and is of so much interest to many people beyond the area of the Isle of Wight, that any interference with its ancient character and appearance could only be looked upon as a calamity, and therefore the committee earnestly begged that the Memorial Committee would not give its consent to the destruction of the chancel arch, which was necessarily a record and an interesting feature of the church. The Society had no other object in view than as its title indicated, namely, the preservation of ancient buildings. The memorial has not been so popular with the island residents as that at Carisbrooke Castle. The action of the Society mentioned has caused considerable comment in the district, and it is quite probable that the committee will be prevailed upon to adopt some other scheme.

A HOUSE, No. 92, Great Titchfield Street, W., partially collapsed a few days ago. Building operations were in progress on an adjoining space, recently occupied by two houses which had been demolished. When the bricklayers had just left work for breakfast, what is described as a rumbling noise was heard, followed by a dense cloud of dust. When the dust had partially cleared off it was found

that the whole of the side wall abutting on the space where the building is in progress had collapsed, practically wrecking No. 92.

THE distribution of prizes to the students of the architecture and building construction and woodcarving classes was held on Thursday at King's College. The Rev. Dr. Robertson, principal of the College, occupied the chair, and was supported by, amongst others, Sir Henry Harben, and the Master, Clerk, and Warden of the Carpenters' Company. Professor Banister Fletcher reported that the competition for the two free scholarships, given by the Carpenters' Company, took place at the College on September 27. There were twelve candidates, of whom ten sat for the examination, the successful candidates being Mr. A. C. Remnant (126 marks) and Mr. C. J. T. Dadd (123 marks). Sir Henry Harben presented the prizes to the successful students, and afterwards delivered a short address to the students present. The Rev. Dr. Robertson proposed a vote of thanks to Sir Henry Harben, saying that a great deal of the success which the classes had achieved was due to the munificent and thoughtful support received from the Carpenters' Company. Mr. Joseph Henry Gibbins, Master of the Carpenters' Company, seconded the vote, which was carried unanimously. Architectural drawings, prepared by the students, were afterwards exhibited. We hope to illustrate the work in an early issue.

At the Ecclesiastical Art Exhibition at Nottingham, which was held in a building adjoining the Guildhall, a very interesting collection of artistic church relics was brought together. Many pieces of Communion plate are shown, of which, perhaps, the most interesting are the chalice and paten from Bacton, in Herefordshire. The chalice is undoubtedly made by the same hand as the celebrated Nettlecombe chalice, which is supposed to be the oldest piece of English hall-marked plate. As the Bacton plate is unmarked, it is probably of older manufacture than the Nettlecombe chalice, and experts have fixed the date at about 1470. One peculiarity is the name, John Caputt, or Capull (probably the donor), engraved or stamped on the foot, contrary to mediaeval custom. The chalice with cover from Findern, in Derbyshire, is unique in design, and, bearing the hall-mark of 1564-5, is believed to be the oldest chalice in Derbyshire. The quaint hammered silver cup is supported on three elephants, and the cover bears another in lieu of the usual knob. In the cover is inserted a Danish coin of 1642. It is thought by some that this cup was used at one time in a monastery, but on the other hand it is suggested that it might have been once in the possession of either a member or an official of the Danish Order of the Elephant. An excellent collection of monumental brass rubbings is shown: the one that claims most attention is Sir John d'Abernon's, being the oldest brass in England. A melancholy exhibit is a case consisting of old carved work and portion of an alabaster tomb and relics of painted glass from St. Mary's Church, and in the same case can be seen specimens of Nottingham pottery from the fourteenth to the nineteenth centuries.

THE new drainage system of Naples has already given excellent results. The outfall at Cumæ is an interesting piece of engineering. The sewer is covered to within a few yards of the sea, and runs under an embankment having the appearance of the Barking sewer, though on a smaller scale. At the outfall a break-water has been built, and a solid dome of very strong masonry. The point selected is immediately to the north of the acropolis of Cumæ, where the marshy plain which contains the lakes of Licola and Patria is situated. This plain is so malarious that it is wholly uninhabited for many miles, and, consequently, the emanations from the sewer do no injury, for no one bathes there, and the place is practically a desert. The pumping stations which are to raise the sewage of the Chiaia district and of the lower quarters of the port are not yet at work, but this will probably be altered before long.

Surveying and Sanitary SUPPLEMENT.

OCTOBER 6TH, 1897.

MODERN SANITATION.

By H. A. SAUL.

(Continued from page 83.)

II.

IN the last article the construction and method of laying the drains were considered, and it is now proposed to deal with the appurtenances of the same in detail, bearing in mind that the class of work is in accordance with the nature of the house, and not of the first order, though thoroughly

direction of its course should be constructed so as to be easily got at.

In the plan accompanying the last article all the changes of direction take place within the inspection chambers, with the exception of a rain-water drain in front of the house—the reason for which will be explained later.

Figures 1, 2, and 3 are a plan and two sections in detail of the inspection chamber at the lower end of the drain, that containing the trap or interceptor for disconnecting the drain from the sewer, and generally known as the *disconnecting chamber*, to distinguish it from the other chambers or manholes of a system. The walls are built of hard bricks

towards the channels, and floated with cement trowled smooth; the sides of the chamber are also coated with cement.

The size of the top is reduced by gathering over the brickwork until the opening is of the dimensions of the cover, which is of galvanised cast-iron.

The interceptor has an arm, which enables

adapted in every way for the purpose for which it is intended.

Although the bye-laws obtaining in many of the districts in and around London make no mention of inspection chambers, a system of drainage can in nowise be considered perfect without adequate means for getting at every portion thereof other than by digging.

If a drain becomes stopped up, the obstructing matter is nearly always found in a bend; it is therefore necessary that every bend formed by a drain having to alter the

set in cement mortar, and rest upon a bed of concrete. The incoming pipes stop short at the inner face of the wall, and the drains continue into the chamber in the form of open channels approaching one another and culminating in a single channel towards the interceptor. The channels are formed with Portland cement, and are semi-circular in section, with a diameter equal to that of the pipe.

The bottom of the chamber is formed of concrete laid with falls (shown by arrows)

the short length of drain between the chamber and the sewer to be cleaned if necessary, and the arm is capped with a plug which fits into a socket at its upper part, and is made with a Stanford joint. This joint consists of a bituminous substance which is applied to the socket and the edge of the plug, and, owing to the elastic nature of the material and the slight adhesion caused by the contact of the surfaces, is a very complete one, and effectually prevents any sewer gas entering the drain. At the upper part of one side of the chamber is

shown the pipe which conveys fresh air for the ventilation of the drain.

The inspection chamber shown upon plan No. 1, at the upper end of the drain, would be constructed in every way similarly to the one described, except, of course, that it would contain neither a trap nor an inlet for fresh air.

The greatest source of danger, viz., the access of sewer gas into the drains, having been prevented, the matter of next importance is to guard against the possibility of any smell from the drains themselves entering the house. This is effected by means of traps fixed at the ends of all branch drains, except those that act as ventilators; these traps all work upon the same principle, viz., the water seal, but are combined in various ways, as, for instance, with a w.c. apparatus, or with a gully at the foot of a rain-water pipe, or with a grease-containing gully to receive the waste from a sink, &c. Figs. 4 and 5 are a section and a plan of the gully at the foot of the rain-water pipe at the front of the house. As this pipe receives the bath waste in addition to the rain-water, it is made to enter the gully by a back inlet, to avoid the unsightliness caused by the splashing of soapy water and the collection of filth which invariably results when the down pipe discharges its contents by means of a shoe above the gully grating. To this gully is also connected the short length of drain which conveys the water from the bay window, and which is made to enter through a side inlet, and in order that the drain may be laid with sufficient fall, the gully has been deepened by means of a piece known as a *gully top*, upon which rests the gully grating of galvanised cast iron, to prevent leaves and other matter from entering the drain. It should be noted that the gully is well embedded in concrete, which keeps it rigidly in position, thus preventing any failure of the joints. The gullies throughout are constructed of glazed stoneware, similar to the drain pipes, and all the joints are made with cement. All the rain-water pipes are shown upon the plan connected to the gullies by back inlets. A method commonly adopted is for the pipe to terminate a few inches above the gully, and be fitted with a *shoe*, which causes the water to be discharged clear of the wall, and well above the centre of the grating; this answers very well as long as the grating is not allowed to become choked, but the system adopted has the great advantage of a direct connection between down pipe and gully, and a clear way for the water in the event of the grating becoming stopped up.

Fig. 6 is a section of the gully placed to receive the waste from the scullery sink, and known as a *grease trap*; it is made larger and deeper than the gullies already described, and the bottom is slightly sunk to hold sand or other heavy settlement, while the grease rises to the top of the water, and becomes collected upon the surface. The large size of the gully possesses the double advantage of a considerable surface of water upon which the grease may collect, and of being easily cleaned out. The sink waste enters by a back inlet, and a rain-water pipe by a side ditto, and an inspection cap, with a Stanford joint, is provided above the trap to enable the drain to be cleaned in the event of a stoppage.

Traps to be thoroughly efficient must possess the following points:—
Freedom from sharp angles, where filth would be likely to accumulate.

An easy bend which will allow the waste to flow smoothly and unchecked.

A water seal—i.e., the dip of the upper part of the pipe within the water of not less than from 1½ in. to 2 in.

Every precaution has now been taken to prevent the access of sewer gas to the drains, and of smells to the house; and all that remains to be considered in connection with the drains themselves is the subject of their ventilation.

For the proper and efficient ventilation of any system of house drainage, it is necessary that at least two *untrapped* openings be provided to the drains, arranged according to either of the following methods, as the circumstances of the case may render advisable:

First, one opening to be at or near the surface of the ground adjoining such opening, communicating with the drains by means of a suitable pipe, shaft, or disconnecting chamber, and situated as near as practicable to the sewer intercepting trap, and on that side of the trap which is the nearer to the building. The second to be obtained by carrying up from a point in the drains, as far as practicable from the above-mentioned opening, a pipe or shaft vertically to such a height and in such a manner as effectually to prevent any foul air from entering the building. In no case should this pipe be of a less height than 10ft.

The second method is simply a reverse of the first, and not so generally adopted, as it is usually possible to place the pipes in the position above described, which method is the more rational on account of the *outlet* ventilating pipe being at the upper part of the drains, the point where any gas or smell would naturally accumulate.

It frequently happens that the soil pipe, i.e., the vertical pipe connected with one or more upstairs water-closets or slop-sinks, occurs in such a position as to form the ventilating pipe at or near the upper part of the drains, for, as will be explained later, a soil pipe must always be carried up well above the roof. In the case under consideration this pipe, although acting as a ventilator, ventilates only a very short length of drain, and so another pipe has been provided at the back of the house connected to the upper part of the drain which conveys the water from the gully adjoining.

(To be continued.)

REFUSE AND ELECTRICITY.

THERE is more than one place in the country where the dust and ashbin refuse of the district is burnt and chastened to clinkers in the furnace, and there is more than one vestry which produces its own electric light. But Shoreditch is alone in the attempt to use the dust as fuel, to apply that fuel to the driving of electric motors, and so to turn the very refuse of the dustbin and the ashpit into sweetness and light. As you turn down one murky street of Hoxton to the Shoreditch Dust Destroying Works, you come upon a string of dust-carts piled up with all the miscellaneous refuse which the miscellaneous life of Shoreditch affords; as you come up another you encounter a tall post of painted iron with an arc light on top, and two incandescent shade lamps branching on either side; and the two, the dust-carts and the electric lights, are as the cause and the effect. Between them is a long chain of ingenious contrivance and scientific adaptation. The dust-carts drive into the Shoreditch works in Coronet Street over a weighing machine, where the refuse from Shoreditch kitchens and Shoreditch manufactories is weighed as carefully as if it were precious metal coming into the Mint. Then the cart goes on—it will be best to follow an individual cart in order to get a general idea of what is done—until it comes opposite one of two lifts. The lifts have square-shaped funnels on top of them,

FUNNELS ON A LARGE SCALE,

and into one of these funnels, after the pause of a moment or two for reflection, the cart tips its load. A man waiting by one of the lifts rakes the precious burden into its place in the lift-bin, and separates from it any hoops of iron or disused bath rims which the inhabitants of Shoreditch may have seen fit to discard. When this task is finished he shouts the British workman's equivalent for "kindly take note that a bin is coming up above there!" to the dustman upstairs, and the heavy ash-bin electrically moves upwards. We, as spectators, follow its direction if not its course, by making our way up a couple of uncompromisingly steep ladders to a floor above. Along this big chamber runs a double line of rails, and along the railway lines run a couple of trucks. But these trucks are the same things as the bins, one of which we have just seen loaded and have followed upstairs. When the platform of the lift containing this truck-bin reaches the level of the rails, it

stops automatically. The attendant dustman, or topman as he is called, on the bin's arrival, adjusts it, and fits to its two little copper horns, which we just notice for the first time, two electric antennae, the effect of which is to draw the bin along just as if it were a piece of soft iron pulled by a magnet. These

ELECTRIC CONTACTS

gently lead the truck with its refuse until it comes to an open grave upon the tipping platform. There are a good many of these graves placed at appropriate intervals along the trucks' railway lines, and they greedily swallow many trucks of refuse during the day. The truck tilts and tips sideways into their yawning mouths. But the refuse does not go straight into the fire. It falls into other bins which move on railway lines at right angles to those on the tipping platform, and each of these lower lines of rails runs over the top of a furnace. The lower rail bins, too, are divided into five compartments, for a binfull of refuse at a time is more than a steady-going fire should be called upon to swallow. One-fifth of a bin is all that a furnace wants at a time, and when the proper time comes the bin slides to its proper position over the sliding roof of the furnace; the sliding roof slips back, detaching the false bottom of the lower bin as it does so, and one-fifth of the bin's contents falls into the back of the fire. The back of the fire is the proper place for it, so that it may be dried and swept by the furnace blast before it comes into contact with the flame. So far we have followed the refuse to the furnace. Here it becomes converted into clinker, and in this form serves the State in an honourable capacity on country roads. But in the course of conversion into clinker it gives out heat which generates steam power, to be used immediately or stored in a huge thermal storage cylinder, and the steam power works dynamos, and the dynamos give light and electric power. First of all, let us consider the furnaces. There are a dozen of these, eight of which are working, and they will eat up more than 20,000 tons of refuse a year. Their average at present is set down as sixty-five tons a day; but there are many days when this is exceeded. The ordinary ashbin refuse is of a very varied description—straw hats and gingerbeer bottles go down to destruction with tea-trays and bedding which has seen better days. The furnaces consume everything. Not a pound of coal is used to burn the rubbish. But a ton of rubbish does not seclude the same amount of heat as a ton of coal, and some day, as the electric wants of Shoreditch become enlarged, the amount of heat afforded by the consumption of the refuse will not be sufficient to supply it, and coal will have to supplement the refuse. At present on Sundays the supply of refuse has to be carefully husbanded, and when the scavengers have cleared up Shoreditch for Sunday, and the destroying works have been swept of every speck of dust and disinfected, there is not quite enough refuse to keep the fires going, and so some tons of coal have to be used. Nevertheless, the destroyers present a striking example of a self-supporting organisation, and the instances of this self-supporting activity extend from the general to the particular. For instance, part of the electric force generated is used

TO WORK ELECTRIC FANS.

The furnaces are kept going under the forced draught set up by these fans. The hot air and any noxious gases that may collect in the upper portion of the destructor house are drawn down air ducts to the fans and there forced through the fires and away up the chimney. The upper portion of the destructor is thus supplied with fresh air every few minutes, while any foul gas arising from refuse is at once drawn off and sent through the fires as a forced draught. There are six boilers, of water-tube construction, and they are supplied with duplicate fittings throughout to guard against breakdown. In order that the heat generated at all hours may not be wasted, the steam raised in the boilers may be passed into a thermal storage cylinder, where it is conserved at a temperature such that when night approaches, and all the resources of the estab-

ishment are called upon to supply electric light, it is full of water at the temperature, and steam at the pressure, required by the engines. It is almost impossible to convey in figures the money value of this valuable and ingenious organisation; but it may be mentioned that in the speech with which Lord Kelvin accompanied the formal opening of the works he stated that whereas the parish used to pay 3s. 2d. a ton to have its rubbish carried away and cast into the sea, it can now treat it here and turn it into light or motive power at a much lower cost.

As people are now preparing to go to the Riviera for the winter, it may be opportune, writes "A Winter Resident on the Riviera," to call attention to the sanitary condition of most of the houses they will find there. Last year before going out I let my house in London. The tenant before taking it had an exhaustive examination by an expert, and it was necessary to show, by a very stringent test, that there was no possibility of the escape of sewage or sewer gas into the house or the adjoining soil. This represents the sanitary standard in England. On arrival at my destination on the Riviera I found a house of an expensive character being built in a very good situation. In the middle of it, in the basement, was a great pit. Inquiring the object of this I was told it was the "fosse," or cesspool for the whole house. The pipes that led into it from the closets were very large and of rough earthenware, with very imperfect joints, and they were all inside the house. I was told that this was quite a common construction. A friend of mine who had an examination made of a house he proposed to take was told it was in the best sanitary condition, so much so indeed that "not a drop of sewage could escape outside the house." Examining a house myself later on with a view to hiring it for the year, I found the cesspool partly outside and partly under the house, the soil pipes coming down inside the house of the very roughest construction, and no pretence of a syphon trap; an inch or so of water in the pan was supposed to provide all necessary security against the admission of sewer gas. The English doctor informed me that 99 houses out of 100 were no better. The same people who insist on excessively stringent tests before taking a house in London go gaily into such a house as I have described on the Riviera. Perhaps they would not do so if they knew the facts which I have set forth above.

Surveying and Sanitary Notes.

MR. R. M. PANKHURST vigorously denounces the Manchester culvert scheme in a letter to the Manchester Guardian. "Surely the citizens will stir themselves," he writes, "to stop the waste of a sum estimated at £258,000, but actually much larger, on the proposed culvert scheme—a scheme at once of panic and of despair. The culvert is wholly unnecessary. By chemical precipitation alone a good effluent can be now sent into the Ship Canal. This effluent can be put on a constant course of improvement, and the standard of purity be constantly raised. Stop any untreated sewage passing into the canal, and put in the effluent obtained by an approved system of chemical precipitation, and no more is needed. The culvert is demonstrably unnecessary. Notice at what point it is to come in. The Corporation is to go to all the trouble and cost of adopting chemical precipitation. It is to go to all the trouble and cost of sludge disposal. Then, and then only, is the culvert to be brought into service. For what? Merely to send the effluent, after 'chemical treatment and precipitation,' miles and miles away by the culvert. That effluent can, by chemical precipitation alone, be made good enough to go at once into the canal. It is charged by some that the effluent from chemical precipitation alone on passing into the canal, stagnant as it is at the point of discharge, will set up secondary decomposition. Now there is no evidence of this. Indeed, all the evidence is the other way. How can anyone say how this effluent will behave in the canal, as long as there goes into the canal untreated sewage? All experience proves that the effluent arising from chemical precipitation turned into the open canal is not liable to anything that can be called secondary decomposition."

THE Rivers Committee of the Warrington Corporation has presented a resolution to the Town Council that the town clerk and borough surveyor be instructed to report upon the Manchester sewage scheme, and that they be authorised to take such steps as they may consider necessary to protect the interests of the Corporation.—Councillor Bennett said that he would like to send forth an uncompromising opposition to the

scheme. A paper had described the scheme as an impudent one, and he did not consider that that was one whit too strong. The scheme was practically the same as the one which last year was withdrawn owing to the strong opposition raised against it. On that occasion it was amended, by which it was intended to put the sewage into the river at Woolston Weir, instead of at Randell's Sluices. That scheme had aroused very great opposition even with the ratepayers of Manchester, and had been defeated at a ratepayers' meeting there. They had now fallen back on their original scheme of sending their filthy effluent into the river at Randell's Sluices. They would also further interfere with the already deficient water supply in the river.—The resolution was carried.

THE recommendations of the sub-committee appointed some time ago by the Sanitary Committee of the Leeds Corporation to consider the subject of reorganising the ashpit and street cleansing department of the city came before a meeting of the main body recently. With very slight modifications, the recommendations were adopted. If approved by the City Council, they will involve the practical reorganisation of this department of the Corporation work, and it is believed that if carried into effect they will place the department upon such a footing that it will be one of the most efficient in the United Kingdom. The main items in the recommendations of the sub-committee, who seem to have gone most exhaustively into the matter, are that the Council be asked to appoint Mr. George Darley as Chief Superintendent of the two departments of ashpit and street cleansing, which are to be amalgamated, at a salary of £350 per annum. Another proposal is to appoint an assistant superintendent, at a salary of 50s. per week, and that the Council should advertise for a man to fill that position. For the purpose of the cleansing work the sub-committee recommends that the city shall be divided into sixteen districts coterminous with the present ward boundaries, that a foreman should be appointed for each ward, to supervise and be responsible for the work of emptying ashpits, cleansing streets, clearing out gullies, &c., and for the removal of water and snow from the streets. Under these men sub-foremen are to be appointed to perform special duties. Then the sub-committee recommends that the duties of the foremen at present employed by the department shall be rearranged.

Practical Carpentry and Joinery.

(Continued from page 171.)

By GEO. ELLIS.

SHORING.—A shore is a temporary timber construction to support a wall that is falling or in danger of so doing, or one that has to undergo alteration and repair; the first, called retaining shores, are of two kinds—raking and horizontal. The raking act by extending the base of the fabric, and so prevent overturning; the horizontal,

FIG. 25. HEAD OF RAKER.

used mainly between two buildings, from which a central one has been removed, by counteracting the thrust of one building by that of the other. The other form, known as dead shores, are used to support the superstructure when the lower part of a wall is removed, as in the insertion of a shop front in a dwelling house. When a raking shore is put up as a precautionary measure, generally one balk only is used, as shown in Fig. 23; the top end is pitched against a vertical piece of deal (called the wall-plate) at some solid point in the wall—theoretically the centre line of the raker should bisect the angle formed by the vertical and horizontal thrusts, but, as a matter of fact, one has to be governed by circumstances in regard to the position. For instance, the foot can seldom be taken further from the wall than the edge of the pavement, and string courses and ornaments often prevent the needles being placed in the best position. The wall-plate is prevented from sliding by a piece of quartering, 3in. square, passing through it and entering the wall to the depth of half-a-brick. This piece, called the needle, should be 1in. deeper outside the wall-plate, and be shouldered on the top side, and further strengthened by a cleat, sunk and nailed above it (see Fig. 25). It also forms an abutment for the raker, the head of the latter being notched under it, to prevent side-slipping. The foot of the raker rests upon a sole-piece firmly embedded in the ground at an angle of less than 90 degrees with the shore, so that it may tighten as it is driven forward. This should be effected gradually with a crowbar, and not by blows with a maul, the shocks from which are likely to injure the wall. When a wall is in danger of falling through failure of the foundation, its tendency is to turn outwards

FIG. 22. FLYING SHORE.

on the sound parts as on a hinge (see Fig. 21), and, being secured at the top part by the wall plates, &c., its turning tendency is developed at the middle in a bulge, which if not stopped will continue till the course joints fracture, when the whole fabric will collapse. To prevent this shores must be applied at various points, to be determined by the particular circumstances. Frequently the floors follow the wall; then shores would be placed in a line with each; they should never be placed

over openings or set-backs in the brickwork. Several shores ranged over each other in the manner shown in Fig. 21 are termed a *system*, and several of these systems may be required for a wall. They should not exceed 12ft. apart.

It is not convenient or advisable to use timber much more than 30ft. long for rakers, and when a greater height than this has to be reached, the shore is used in two lengths, as shown in Fig. 21. The lower piece, called the

FIG. 23. SECTION.

FIG. 24. HALF ELEVATION. HALF LONGITUDINAL SECTION.
DEAD SHORING FOR ALTERATIONS

FIG. 26. BRICKLAYER'S SCAFFOLD.

back shore, rests upon the top raker; the upper piece, called the rider, springs from this with a pair of hard-wood folding wedges between the abutment for the purpose of setting it up to the needle. 1in. by 9in. braces should be nailed across the system at each side of the head of the rakers to stiffen them, and several turns of hoop-iron bound around near the bottom; the back shore should also be dogged to the sole piece. It is usual in shoring to use stuff much larger than the strains actually require, as it is more economical in the eventual conversion. The following scantlings are the minimum for the various heights mentioned, for walls 20ft. high: Size of raker, 5in. by 5in.; 30ft., 6in. by 6in.; 40ft., 8in. by 8in.; 50ft. 9in. by 9in.

Horizontal or flying shores consist of a beam fixed tightly between vertical wall plates, secured to opposite walls of the adjacent buildings, the ends resting on needles. Struts set at an angle of 45 degrees spring from needles in each end of the wall plate, and abut against straining pieces nailed to the shore. Wedges are driven at the ends of the straining pieces and the beam to set all up tight. Cleats must be fixed behind the needles, and should be sunk as shown in Fig. 25. The space between these shores should not exceed 15ft., and the height of beam should not be less than three-quarters of the height of the wall. Scantlings: Span 15ft., beam 6in. by 4in., struts 4in. by 4in.; span 30ft., beam 8in. by 8in., struts 8in. by 4in. or 6in. by 6in.

When the lower part of a wall is to be removed, as, for instance, when a dwelling-house is transformed into a shop, it is necessary to insert a breastsummer or a girder to carry the upper part. To do this with safety, raking shores have to be placed against the front, to prevent running out, and the dead weight of the wall taken on to a rectangular arrangement of shoring, shown in Figs. 23 and 24. Holes are cut through the wall, as near the proposed opening as possible, but always above the floor and under a solid piece of brickwork. These holes should be about 6ft. apart, and just large enough to get the needles through. These are either 12in. square balks or 8in. rolled iron joists, and they are supported by upright balks, called dead shores, on each side of the wall. These must be carried on to solid ground, cutting through any floors or cellars that may intervene, and their lower ends rest on sleepers, to distribute the weight.

Folding wedges are inserted at the heads of the shores to set the needles close up to the brickwork; timber dogs are then driven in at each end of the shores to prevent them shifting.

All window openings should be well strutted, and uprights sprung between deals laid on the floors and ceilings throughout the house down to the basement. These deals, of course, run at right angles to the joists. The brickwork can then be cut away, the girder or breastsummer placed in position—the latter should have a 4½in. plate spiked on the inside to carry the floor joists, which are notched out to receive it, a stone template inserted under the ends, and the brickwork built up to it; a bed of cement is laid on top, and the work made good up to the cutting away. At least a week should be allowed to elapse before the shoring is struck, to give time for the new work to set, the rakers being left till the last.

SCAFFOLDS are temporary erections to carry materials and the workmen employed in building operations; they are of several forms, according to the extent or kind of work in which they are employed. The bricklayer's scaffold (Fig. 26) is the commonest and simplest in point of construction. It consists of a number of upright poles of Swedish fir, about 30ft. long and average diameter 4½in., placed about 8ft. apart and 4ft. distance from each side of the wall it is proposed to build. These uprights, called standards, are firmly fixed in the ground, or sometimes in tubs of earth, are crossed by horizontal poles called ledgers about every 5ft. in height, securely fastened with scaffold cords, tightened up with wedges. Upon these ledgers rest one end of the putlogs, the other ends to the depth of half a brick being built in the wall as the work proceeds. The holes so formed are filled in from a ladder after the scaffold is struck. The putlogs are hewn pieces of any tough hard wood about 3in. square and 5ft. long, the scaffold boards are made from 1½in. by 9in. by 10ft. lengths of rough but sound spruce fir with their ends bound with hoop-iron. When the scaffold is of considerable height or length, diagonal poles are

fixed to brace it. Masons' scaffolds, having to carry heavier material, are made more substantially than bricklayers'; they are in two tiers, one about 12in. from the wall, the other 4ft. 6in. away; the inner tier is necessary, partly because it would be impossible to arrange for holes for the putlogs in the right places, and partly because the great weight would injure the "green" wall. The standards

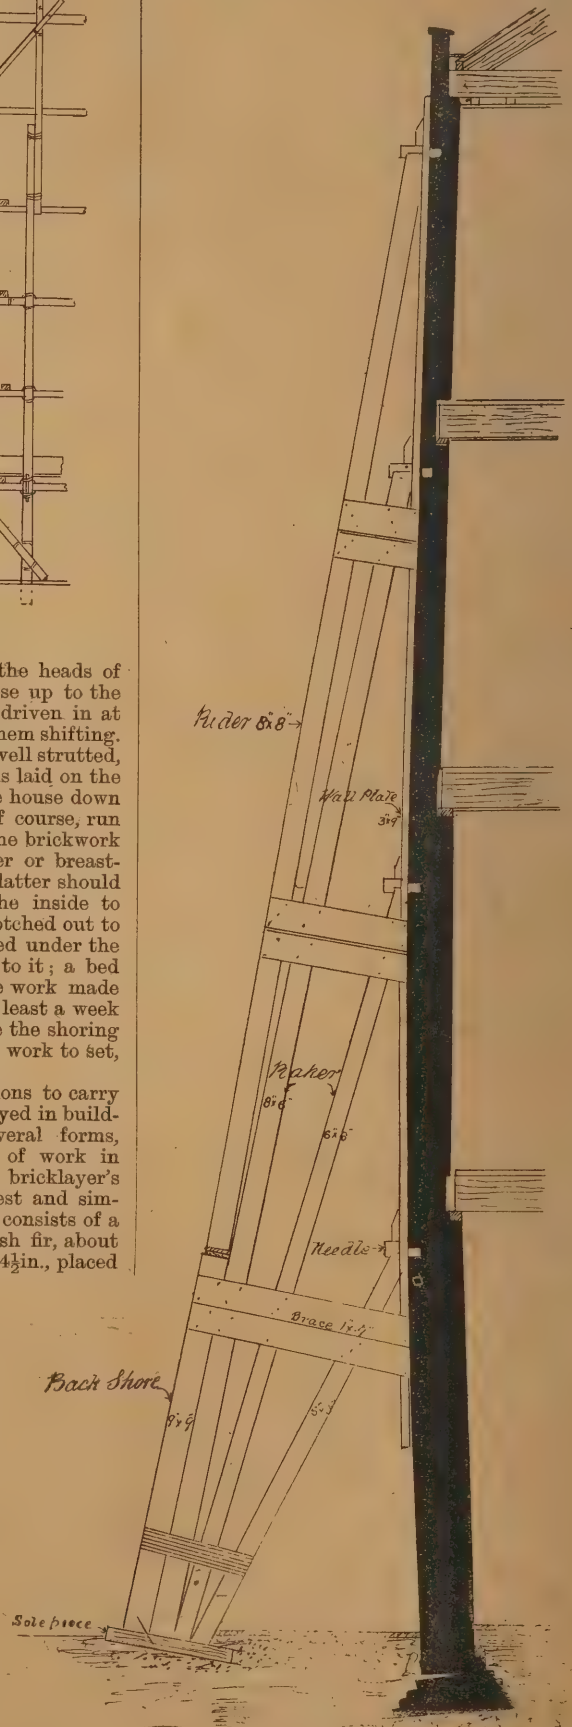

FIG. 21. A SYSTEM OF RAKING SHORES.

are formed of deal or batten stuff bolted together, the ledgers running between and resting on short lengths of batten fixed in the standards. When ordinary scaffold boards are used they are laid in two thicknesses, but frequently 2½ in. deals are used for the staging.

GANTRIES are substantial erections of balk timber used in extensive building operations. There are three varieties—the platform, the traveller, and the tower. The platform gantry (shown in Fig. 27) is used in urban districts, where it is necessary to keep the footway clear, the scaffold proper being erected on the top. It consists of two tiers of standards out of balk timber, 8 in. by 8 in. by 10 ft., resting on sleepers, and supporting a head of similar scantling; between the standards pairs of angle braces are fixed to cleats, and straining blocks; the platform is constructed of 2½ in. battens spiked to the heads. All the parts are dogged together.

THE TRAVELLER gantry is used for lifting, moving, and depositing in position heavy blocks of stone, &c.; it is made both in permanent and temporary form, the former for use in stone merchants' and builders' yards, the latter upon the site of the building. It is constructed in a similar manner to the platform gantry, but more extensively braced, and as the space between the tiers requires to be clear for the passage of the traveller, there are no cross ties except at the ends where transverse heads are firmly bolted. Iron rails are fixed on the longitudinal heads, and upon these runs the carriage of the traveller; this is formed of two trussed girders bolted to two short cross beams mounted on wheels; rails are also fixed on the tops of the girders for the carriage of the winch to run upon. This carriage moves across the space transversely, whilst the traveller carrying it moves longitudinally to the extent of the gantry, thus enabling the load to be deposited anywhere within the boundaries of the framing.

THE TOWER OR DERRICK gantry is a lofty construction of deals bolted together in three thicknesses, forming three square skeleton frames arranged in a triangle in plan. Each frame or tower, about 8 ft. square and 30 ft. from its neighbour, is diagonally braced in 10 ft. heights; the tops are joined by three deep trusses, and covered with a platform of deals. The crane or derrick is mounted directly over the centre of one tower, and its stays are anchored by chains to the bottom of the other two. The bottoms of the towers are filled with bricks or sand, to counter-balance the weight of the crane and its load.

(To be continued.)

A WINDOW has been placed in the church at Theydon Bois, as a memorial of the late Miss Frances Mary Buss, founder of the North London Collegiate School for Girls.

THE life-size marble statue of the late Judge Thomas Hughes, which is to be erected at Rugby by old Rugbeians and others, has been entrusted for execution to Mr. Brock, R.A., who will carry out the work forthwith.

At the Shire Hall, Norwich, the portrait of Mr. C. S. Read, for many years M.P. for Norfolk, was unveiled on Saturday week. It was executed by Mr. J. R. Shannon, R.A., and may be pronounced a good likeness. It is full length, and depicts Mr. Read with an agricultural implement in his hand.

ANOTHER alarming result of subsidence caused by brine-pumping occurred recently in Northwich, Cheshire. A large store-room in Castle Street, belonging to a furniture broker, fell on its back without the slightest warning, and was completely ruined. It is only a few weeks since a church in the neighbourhood was condemned for the same cause.

MR. A. G. TEMPLE, F.S.A., director of the Guildhall Art Gallery, is acting as the editor of a new serial publication that is about to be issued under the title, "Sacred Art: The Bible Story Pictured by Eminent Modern Painters." The book will be a panorama of the Bible history, beginning with the Creation, and passing in review the whole story as it has been told by the great modern painters. The pictures will be entirely modern.

Professional Items.

BANGOR.—The organ which has been erected in Bangor Cathedral by Messrs. Hill and Co., London, at a cost of over £2000, and which is said to be the largest in Wales, was opened by Sir W. Parratt, the organist of St. George's Chapel, Windsor.

BIRMINGHAM.—At a meeting of the Public Works Committee of the City Council the question of the sewers was mentioned, and the City Surveyor (Mr. J. Price) reported that the work of inspection was making good progress. None of the districts are finished, but the report from the Edgbaston and Harborne district may be expected first, and this, it is hoped, will be ready for presentation to the Committee at the next meeting, a fortnight hence. Contracts which had been arranged during the recess were entered into for the construction of the sewers in Greenfield Crescent, Edgbaston, and Golden Hillock Road, Small Heath, and also for the construction of new sewers in Washwood Heath Road, Alum Rock Road, and Arden Road, Saltley, thoroughfares in the midst of a rapidly-growing district.

BLACKBURN.—A report issued recently by the Town Clerk of Blackburn showed that the following public works are to be undertaken for that town as necessity arises:—Tramway purchase and conversion to electricity, £100,000; sewerage, £38,000; recreation ground, £12,000;

SECTION. FIG. 27. PLATFORM GANTRY ELEVATION.

markets, £28,000; municipal lodging-house, £17,000; wood paving, £11,000; cemetery extension, £12,000; refuse destructors, £15,000.

BRADFORD.—A new Art Gallery is proposed in conjunction with an extension of the Rawson Place Markets. The scheme is only one of private origin, and therefore may not be accepted, although it has been supported by weighty recommendations from many quarters. The plans provide for an extension of the Meat Market and the erection of fourteen shops in Northgate, while the main entrance to the Free Library would be in Rawson Square. There would be a handsome porch entrance about 40 ft. in width, flanked by a large tower about 125 ft. high. On the Northgate side would be a fine dome, 70 ft. high. The Art Gallery accommodation would be on the first floor above the shops, with a gallery crossing the market, but there would be a large air space in the middle to secure the maintenance of light in the markets. The floor space which would be comprised within the new Art Gallery would be 14,000 square feet, as compared with 5400 square feet at the present premises in Darley Street. The most satisfactory feature claimed for the project is that it would carry out the contemplated extension of the markets and the erection of an Art Gallery, together with the widening of Northgate, at a total cost of about £25,000, whereas the extension of the markets alone, it is estimated, would cost £15,000. Thus an Art Gallery would be obtained at a cost of about £10,000.

CANNING TOWN, E.—Sir Walter Besant has agreed to open the new residence of the Mansfield House University Settlement at Canning Town about the second week in November. The new residence, which has been firmly bedded on concrete foundations, will contain room for about sixteen men, and about £2500 are required to open it free from debt. The Men's Club has also been enlarged by the addition of another house, and will shortly be ready for occupation.

CARDIFF.—At a special meeting of the Town Hall Committee of Cardiff Corporation, the Borough Engineer (Mr. W. Harpur) submitted certain slight alterations suggested by Mr. Waterhouse, R.A., assessor for the Town Hall and Law Court plans, on the answers to the various questions which had been sent out to the competing architects; but inasmuch as the answers had already been forwarded, the Committee thought it would be unwise now to alter the decision previously come to.

The initial ceremony in connection with the building of a new Catholic Church at Mountain Ash, took place last week. The church is designed to supersede the present unpretentious school-chapel in Napier Street. The new church, pleasantly situated on the hillside at the entrance to the busy little township, when completed, will present the simple but graceful outlines of an edifice in the decorated style of the Gothic order, and is being erected by Messrs. Collins and Godfrey, Tewkesbury, from designs by Mr. Bernard Smith, F.R.I.B.A., whose services were employed in the planning of the

London Law Courts. It is estimated to cost over £3000.

CASTLETON.—The foundation stones of a new Wesleyan Chapel and schools to take the place of the old building, which has done duty for nearly a century, were laid a day or two ago. The new buildings are being erected on a site off the Chapel-en-le-Frith Road. They comprise chapel, school, vestry, class-rooms, kitchen, lavatories, with heating vault, cellars, &c. The buildings will be entered through a porch in the angle, with arched, moulded, and enriched doorway and small traceried window. The chapel will be 50 ft. long by 33 ft. wide, divided into five bays by internal buttresses arched over to form an arcade on each side, enclosing mullioned windows. In the gable towards the road will be a large five-light stone window, with cusped tracery, and at the chancel end a similarly treated window, intended to be filled with painted glass. The end bay will be raised 3 ft. above the chapel floor, and treated as a combined choir and chancel, with rich traceried screen, reredos, &c. The school, which will be 30 ft. long by 22 ft. wide, will form a transept divided from the chapel by folding doors. The chapel has a moulded and traceried hammer beam roof, ceiled at the collar. All the internal woodwork will be of pitch pine, stained and varnished. The windows are to be fitted in with leaded lights in "cathedral" tints. Externally the buildings are to be of the local limestone in regular coursings, with Stoke stone dressings. The contracts, amounting to £1571, have been

let to Mr. Jas. Fidler, of Eckington, for the builders' work; Messrs. Wheat and Son, of Castleton, for the joiners' work; Messrs. Chadwick and Sons, of Sheffield, for the plasterers' and slaters' work; Mr. George Rusling, of Sheffield, for the plumbers' and glaziers' work; and Mr. Roe, of Castleton, for the painters' work. The architect is Mr. Herbert W. Lockwood, of Pinstone Street, Sheffield. Although the contracts amount to a little over £1500, the estimated cost of the building is £2000.

DUNDEE.—The pipe organ built for Lasswade Parish Church by Mr. John R. Miller, Dundee, has been erected in the choir gallery behind the pulpit, and occupies two side arches. The console is placed in the centre arch, and in front of the choir seats. Tubular pneumatic action is applied to the whole organ with great success.

EAST MARKHAM.—The restoration of the church at East Markham, near Retford, which was commenced last June, is almost completed. This is a continuation of the work which was executed in 1883. The church is a neat Gothic edifice, with chancel and side aisles, and a lofty embattled tower, containing six bells; it has several ancient monuments and armorial paintings of the Markhams, Cresseys, Merings, and others. The floor has been entirely relaid on concrete, with a raised surface of wood for seating accommodation. There is to be added a new pulpit in oak to correspond with the other furniture. A new altar, consisting of Casham stone, measuring 12ft. long, 4ft. wide, and 3ft. 6in. high, and weighing about four tons, has been placed in the chancel, which is to be elaborately fitted. A heating apparatus has also been fixed at a cost of upwards of £100, and was supplied by Mr. John Grundy, London. In taking up the old floor the original altar was discovered, and also a stone, upon which was a single name. The architects of the restoration are Messrs. W. Bucknall and J. N. Comper, of Westminster, S.W., and the builders Messrs. Rudd and Son, of Grantham.

GLASGOW.—At a recent meeting of the Dean of Guild Court, Lord Dean of Guild Graham made a statement of the work done during the last twelve months. Though not exactly a record year, it had been far and away the largest year since 1875-76. The number of linings granted had been 676, and the value of the buildings authorised had been £1,851,005, an increase of no less than £560,000 over last year, and £830,000 more than the average of the last ten years. Examining the figures in detail he found that, as in recent years, the chief progress had been in two-room tenements, the number of which had been 2755, as compared with 1733 last year and 1247, the average of the last ten years. In one, three, and four-room tenements there had also been an increase, the figures being respectively 811, 972, and 204, as compared with 523, 776, and 166. Five-room houses seemed less in favour, as only 24 linings had been passed, and for larger-sized houses the number had only been 104. For shops 235 linings had been granted, which compared unfavourably with last year, when the figures were 277, but it was considerably above the average of the ten years, which was only 136. Public buildings naturally fluctuated, as one large building in any one year might turn the scale, but with four buildings of a value of £180,000 the year had more than doubled the recorded average. Those who were specially interested in churches and schools would be disappointed at a falling off, the figures being £79,600, as compared with £99,150 and £96,700 in the last and previous years, but here, again, the average had been more than maintained, that average having been £63,000. In warehouses and shops the progress had been most marked, the year having been a record one with 141 linings, valued at £486,690, which overtopped even the great year 1875-76, when the amount was £445,174.

LONDON.—For some months past, under the direction of the Board of Works for the

St. Giles' district, a public lavatory has been in course of construction at High Holborn, near the Royal Music Hall. The work was designed and executed, at an estimated cost of £3697, in accordance with the drawings and specifications of Mr. George Wallace, engineer to the Board, the contractors being Messrs. Killingbank and Co., of Camden Town. The internal fittings are of the most modern description, and the sanitary arrangements have been carried out by Mr. G. Jennings, of Palace Wharf, Lambeth. Considerable difficulty was experienced in making the necessary excavations beneath the public way owing to the presence of a cast-iron tube, about four and a half feet in diameter, embedded in solid brickwork. This tube was constructed some thirty years ago for the purpose of conveying parcels between the General Post Office at St. Martin's-le-Grand and Euston. The removal of the obstruction involved some delay in the construction of the lavatory, which has been built for the convenience of men and women, and erected under the provisions of the Public Health (London) Act, 1891.

MANCHESTER.—Manchester is at last to have a grain elevator. The contract for the work has been let to the American elevator builders, Messrs. John F. Metcalf and Co., of Chicago, and the elevator is to be ready for traffic in January, 1898. The storage capacity of the building will be of the most complete character, and the elevator building will have room for the storage of 40,000 tons of grain. There will be 226 bins in the house, varying in storage capacity from 37 to 300 tons. The bins are to be constructed of wood; and the exterior of the building will be brickwork. The building will stand at an average distance of 340ft. from the front of the quay, where there will be a tower containing a marine leg, which will be lowered into the hold of the vessels, and is designed to discharge a cargo of grain at the rate of 350 tons per hour. The appliances for the delivery of the grain will be on an extensive scale and of the most complete character. An important feature in the house will be Metcalf's patent dryer, used in America with most satisfactory results. The dryer will be capable of drying 50 tons of grain at each operation, and grain can be moved to or from the dryer from or to any bin in the house.

NEWRY.—Whilst a labourer was engaged raising some bank gravel in a field near the Glen, opposite Tower Hill, the bank gave way, and revealed a large cave or tunnel. The interior was explored and it turned out to be a fine building some 25 yards long in two compartments, about 4ft. high, and 5ft. broad, well faced in both sides with stone, and covered over the top with very large stones, some 3ft. broad, passage quite dry, altogether forming a curious underground structure.

SHEPLEY.—St. Paul's Church, Shepley, was reopened last week after alterations and improvements. The alterations, carried out under the superintendence of Mr. W. Cooper, embraced the removal of the old-fashioned pews, which have been replaced by substantial oak benches, with sloping backs; the erection of a gallery over the west end, approach to which is gained by a staircase from the body of the church—the gallery taking the place of an old one which was narrow and dangerous; the erection of a new oak vestibule, the upper portion of which is filled in with stained glass, and which serves as a shield to the main entrance; the erection also of a handsome oak screen which divides the chancel from the nave, and the enlargement of the chancel. This latter has been effected by extending westwardly into the nave beyond the chancel arch; and the spaces on the north and south sides of the part extended are fitted with oak benches, which are set apart for the lady members of the choir; and the general idea in carrying out one part of the improvements has been to give more space in the chancel and sacarium, the general improvement of the entrances and exits of the church, and

the repair of the edifice. The floor of the chancel has been laid with marble mosaic, and tiled pavements have been laid down on spaces which were formerly flagged. The heating arrangements have been greatly improved, and the external structure has been overhauled, and many greatly needed repairs carried out. The works have been well carried out from designs and under the superintendence of Mr. W. Cooper, architect, Huddersfield, by the following contractors:—Mason, Mr. Harris Wood; joiners, Messrs. T. and J. Hawley; plumber, Mr. G. Lindley; slater, Mr. W. E. Jowett; plasterer, Mr. A. Jessop; mosaics, Messrs. Pateson; tiling, Messrs. Maw and Company; decorating, Messrs. Lunn and Cardno; and heating, Mr. J. W. Thornton.

SHREWSBURY.—The ancient church of St. Alkmund, Shrewsbury, has been reopened after partial restoration. The work of restoration has been to render the inside of the building more church-like and dignified in form. As soon as further funds are obtainable it is proposed to fill in the windows with stone tracery and improve the flat plaster ceiling with wood principals and panelling; to open out to view the ancient tower arch (now blocked up with a brick wall), and generally to improve the appearance both internally and externally. The work just executed has been the removal of the west gallery (which on examination proved to be absolutely rotten and unsafe), the lowering and reconstruction of the seating to a more convenient form, putting concrete and solid wood block floors under same in place of the old boarded floors, which were found to be in a bad state of dry rot; the formation of a chancel by throwing out a projection into the nave, in which are placed oak stalls for the clergy and choir; and the erection of oak screens, for forming vestries and organ chamber. The organ, which formerly stood in the west gallery, is now placed in the chancel, Mr. Ebrall, organ builder, of Shrewsbury, having entirely reconstructed it for its new position. The new chancel floor is paved with blue stone in squares, the sacarium with polished coloured marbles; and an oak-traceried pulpit is placed against the north screen. One of the nave windows has been filled in with stone tracery and cathedral glass, and it is proposed later to fill in the other windows in a similar manner, though with some variety in detail. A new porch has been erected on the south side of the church. The old porch at the east end of the church has been built in, and forms a choir vestry. The whole of the work has been executed by Mr. E. Price, builder, of Shrewsbury. The architect was Mr. A. E. Lloyd Oswell.

STONEHAVEN.—The designs of the proposed new Corporation lodging-house at Stonehaven, submitted by Messrs. J. and J. A. Scuttar, architects, Aberdeen, have been awarded the first place by the professional assessor, and the architects instructed to proceed with the preparation of the working plans, &c. The selected site is on the south side of Cowie Lane, to which the building will have a frontage of 52ft., extending back 63ft. The front elevation shows a two-story building of neat design, although not ornate. The main entrance is in the centre, and leads to an entrance hall, from which, to the right, is the day-room, with scullery, superintendent's office, and shop; while to the left the superintendent's house, comprising kitchen, parlour, bedroom, and bathroom, is placed. To the rear, in the main building, is a dormitory for twelve cubicles, with bathroom and lavatory. The out-buildings consist of a wash-house for use of lodgers, store, coal cellars, and lavatory accommodation, with an airing yard. The staircase, which is conveniently situated in the centre of the building, commands all the dormitories. The upper floor consists of three dormitories, containing twenty-eight cubicles, with ample lavatory accommodation, a sick room being provided in addition. The cubicles have been designed so that each has a separate window, thus assuring complete ventilation. The whole arrangements will be on modern and improved principles.

Enquiry Department.

"ARCHITECTURE IMPROVED."

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have in my possession a little book entitled "Architecture Improved, in a Collection of Modern, Elegant, and Useful Designs, &c., in the taste of Inigo Jones, Mr. Kemp, &c. Designed by Robert Morris, surveyor, late of Hyde Park Street, London; and sold by Robert Sayer, opposite Fetter Lane, Fleet Street (1755)." I shall be glad if you could inform me whether it is of any value as a curio.—Yours faithfully,

J. G. R.

There are many of these books. They were published at a time when Architecture was considered a thing to be learnt by rule and proportion, and that, given a certain amount of "taste," any person could, by the aid of rules, produce living Architecture. When these books were printed the Gothic tradition still survived among the workmen, so that good work was produced by their means, because round the lifeless skeleton of scholasticism the mason and the carver built their quiet, unassuming "classic" edifices. The book has little pecuniary value, and is only interesting to the student.—ED.

SOCIETY MEETINGS.

The Architectural Association.—The Architectural Association commences the winter session this week. It will hold its annual general meeting on Friday, at No. 9, Conduit Street, W., when Mr. Hampden W. Pratt, F.R.I.B.A., will deliver his presidential address and distribute the prizes, medals, and certificates. The drawings submitted in competition for the various prizes offered by the Association will be exhibited, also student's drawings executed in the studio and school of design during the past session. The classes, which are held at 56, Great Marlborough Street, commence on October 11, and the studio re-opens on October 12.

The Institution of Civil Engineers.—The prize list of the Institution of Civil Engineers for the session 1896-97, now made known, contains awards as follows:—The Howard prize of 50 guineas to Mr. Hilary Bauerman, in recognition of his work on the metallurgy of iron. For original papers presented to the Institution, Telford medals, with premiums of books or instruments, to Messrs. H. A. Humphrey, for "The Mond Gas-Producer Plant and its Application;" to Colonel Penny-cuik, R.E., for "The Diversion of the Parivar;" to Mr. E. C. Shankland, for "Steel Skeleton Construction in Chicago;" to Mr. Dugald Drummond, for "High Pressure in Locomotives;" and to Mr. Thomas Holgate, for "The Enrichment of Coal Gas." George Stephenson medals and Telford premiums to Mr. Cruttwell, for "The Tower Bridge Superstructure," and to Professor Unwin, for "A New Indentation Test for Determining the Hardness of Metals." Watt medals and Telford premiums to Messrs. Hay and Fitzmaurice for their joint paper on "The Blackwall Tunnel." The Telford premium list contains the names of Messrs. Donaldson, Ripper, Ravenshaw, Worth, Santo Crimp, Homfray, Nichols, Ramsay, H. D. Smith, and Major Leach, of the Corps of Engineers, United States Army. Awards to students attached to the Institution comprise—The James Forrest medal to Mr. A. H. Jameson, the Joule medal to Mr. H. W. Barker, and Miller prizes to Messrs. Beer, Brand, Berridge, and Kitchin for papers read in London, and to Messrs. Godfrey and Garvie, of Manchester, Mr. Carter, of Newcastle, and Mr. Hurt, of Leeds. This year marks the first award by the Institution of the medals named after James Prescott Joule, the discoverer of the mechanical equivalent of heat, and James Forrest, whose long service as secretary and the care devoted by him to fostering the student class have, on his retirement, been commemorated by the foundation of this medal.

Trade and Craft.

WORKMEN'S COMPENSATION ACT.

The concise and well arranged handbook to the Workmen's Compensation Act, 1897, prepared by Mr. M. Roberts-Jones, will be found an easy key to the workings of an important but little understood Act. Questions of liability often trouble employers in the building trades, and his liability in respect of workmen in cases of accident is a matter in which the master may easily familiarise himself by perusal of Mr. Roberts-Jones's well-written handbook. In his treatise, the author has been thorough and at the same time lucid, and we recommend his work to those interested in the subject.

STEAM DUST-CARTS.

The Chiswick Urban District Council has shown a good example to other districts by the adoption of a new kind of dust-cart, which is known as the Thornycroft Patent Steam Dust-Wagon. The carts, which have a capacity of six cubic yards, are built on the familiar tip-wagon model. They can carry a weight of four tons. The weight of a car unloaded is three tons. The cars are driven by steam, the boiler being of the Thornycroft launch type, arranged to pass air directly over the heating surface, so as to check the generation of steam when necessary. The engine can run up to 400 revolutions a minute, and can be thrown in and out of gear without shock by means of a special clutch. This is, of course, very convenient when constant stoppages have to be made. A run of five or six hours can be made without taking in water. During a working day of ten hours collecting dust and taking it to the tip, about two hundredweights of steam coal are consumed. On an average eighteen cubic yards of refuse are collected and tipped in the day. One man drives and steers. The Chiswick authorities estimate a saving of £250 a year on each steam wagon over the old system of collecting by horse carts.

TILE-LAYING—WHICH SECTION?

At a recent meeting of the Barry Trades' Council, held under the presidency of Mr. T. Evans, a letter was read from the local Master Builders' Association, in reply to a communication from the Council, stating that the question of laying brick tiles by plasterers was discussed at great length. It arrived at a unanimous decision that tile laying was work that should be performed by either bricklayers or masons, and not by plasterers. This decision was based on the ground that tiles were a manufactured article, and to lay them properly tools must be used which no plasterer ever used, and the Association was now fully determined to abide by this decision. Mr. Saunders, a representative of the Masons' Society, asked for the Council's acceptance or rejection of that ruling, as a plasterer was now employed in doing such work. Seeing that the Plasterers' Society was not represented that evening, it was decided the question be adjourned.

NATURAL GAS IN PHILADELPHIA.

A discovery of a remarkable kind is reported from Philadelphia. For some time past the proprietors of a stockyard near that city have been much troubled by the bubbling out of gas from wells sunk on their land, the effect of which was to render the water disagreeable for drinking and unfit for some other purposes. As a consequence fresh wells were sunk, until the number in all reached seventeen. The same phenomenon, however, was observable. At last, by accidental contact with a torch, it was found the gas was combustible. An engineer then tried leading it through pipes, and lighting it in the usual way. The gas is said to make a capital illuminant, largely free from smell and smoke. It has been used, therefore, for lighting all the works, and the supply shows no signs of exhaustion; on the contrary, it is said there appears to be enough to light half the city.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ACTON.—For the erection of additions, &c., to accommodate 600 children, and for caretaker's house, at the Beaumont Park Board Schools, Acton-lane, for the Acton School Board. Mr. E. Monson, architect to the Board, Acton Vale, W.

Lott and Son	£10,045 0	G. Hooper	£8,225 12
Leeder and Co.	9,343 0	C. F. Kearley	7,994 0
Pattinson and Co.	9,195 0	Exors. of Nye	7,965 0
J. and M. Patrick	9,138 0	Goole and Son	7,800 0
J. W. Brooking	8,947 0	W. Blackburn, Chis-	
Godson and Sons	8,317 0	wick, W.	7,750 0

* Accepted subject to the approval of the Education Department.

AWSWORTH.—For sewerage and sewage disposal works, for the Basford Rural District Council. Mr. H. Walker, C.E., Newcastle-chambers, Nottingham. Quantities by engineer:—

J. F. Price	£3,077 7	Hawley and Son	£2,522 5
H. Vickers	2,998 10	H. H. Barry	2,320 0
J. H. Vickers, Ltd.	2,527 0	James Holmes	2,249 0
J. Lane and Son	2,475 10	J. Holme	2,156 0
Amos Jenkins	2,440 5	Cope & Raynor, Gre-	
R. Holmes and Co.	2,350 0	gory-street, Lenton*	2,096 13

* Accepted.

BALLYGOWAN.—For re-roofing and re-ceiling Presby-terian Church, for the Committee. Mr. A. H. De Wind C.E., architect, Comber, Belfast.

Andrew McRoberts
 £321 | Thos. Morrow, Bally- | |

David McNamee
 318 | gowan | £349 |

James Grogan
 350 | * Accepted. | |

CHADWELL HEATH (Essex).—For a further section of the foundations, and a lodge, in connection with a lunatic asylum at Chadwell Heath, Ilford, for the West Ham Corporation. Mr. Lewis Angell, borough engineer, Town Hall, Stratford, E.

J. Jackson	£8,066	Cliff Ford	£6,235
J. and M. Patrick	7,010	Gregar and Son, Strat-	
G. Sharpe	6,900	ford*	6,000

* Accepted.

DRAYCOTT.—For extensions to Victoria Mills, for Mr. E. T. Hooley. Mr. G. S. Doughty, architect, Britannia-chambers, Pelham-street, Nottingham. Quantities by the architect:—

J. Shaw	£4,600	W. E. Shaw	£4,220
J. F. Price	4,551	H. Vickers	4,220
J. W. Woodsend	4,500	F. Messom	4,219
T. Barlow	4,470	H. J. Robinson	4,140
W. Manle	4,400	John Brown	4,065
E. Woodward	4,275	F. Perks and Son, Long Eaton*	4,025
G. Youngman and Son	4,253		
J. H. Williamson and Co.	4,245		

* Accepted.

DYMOCK (Gloucestershire).—For the erection of a police-station, for the Standing Joint Committee. Mr. M. H. Medland, county architect, 15, Clarence-street, Gloucester:—

H. A. Forre	£1,950 14	E. W. Wilkes	£1,365 0
A. King and Sons	1,648 0	Gurney Bros., Glou-	
W. Jones	1,620 0	cester (accepted)	1,297 0

FOLKESTONE.—For the erection of fifty artisans' dwellings, East Cliff, for the Corporation. Mr. J. White, borough engineer, Folkestone:—

W. J. Adecock	£16,970 0 0	Stephen Vant	£13,297 0 0
Multon & Wallis	16,490 0 0	G. Castle & Son	
Thos. Barden	15,498 0 0	Folkestone*	13,922 6 10
Thos. L. Dennis	15,470 0 0		

FORRES.—Accepted for the carpentry, plastering, slating, plumbing, and painting works in the erection of five artisans' dwellings in Market-street, for Mr. J. Mackenzie. Mr. P. Fulton, architect, Forres:—

A. and R. Dunbar, Elgin			
C. Brodie, Elgin			
J. Fraser, Inverness			
R. H. W. Forsyth, Forres			£950
W. Fordyce, Elgin			

GLEN PARVA.—For the erection of six dwelling houses for Mr. Edward Shardlow. Messrs Simpson and Harvey, architects and surveyors, Alliance-chambers, Leicester:—

Halford and Sons, Blaby	£1,410		
-------------------------------	--------	--	--

The lowest of three tenders received.

GOSPORT.—For additions to house, 8, High-street, Gosport. Mr. W. H. Fry, architect and surveyor, Gosport:—

Vincent	£521	Gibbons	£485
Jube	520	Chrose	475
Lane	510	Lear	465
Rayley	516	Duga	450
Johns	460		

GROBY.—For the erection of workmen's dwellings, Ratby-road, Groby, for the Patent Victoria Stone Company, Ltd. Messrs. Simpson and Harvey, architects and surveyors, Alliance-chambers, Leicester:—

Joseph Plant	£3,820 16 3	J. E. Johnson and Son, Leicester*	£3,711 0 0
Hardington and Elliot	3,755 16 3		
Joseph Wright, South Wigston*	3,740 0 0		† Withdrawn.

* Accepted for the whole of the work.

CONTRACTS OPEN.

BOROUGH of KINGSTON-UPON-THAMES.

TO ROAD CONTRACTORS AND OTHERS.
The Corporation invite TENDERS for SEWERING, LEVELLING, MAKING, KERBING, CHANNELLING, PAVING, and LIGHTING Lincoln-road, in the said Borough, in accordance with plan and specification prepared by the Borough Surveyor, which can be seen at his office, Clattern House, in the said Borough, where forms of Tender can be obtained.

Sealed Tenders, endorsed "Tender for Road Making," to be sent to me on or before WEDNESDAY, OCTOBER 13th, 1897.

The person whose Tender is accepted will be required to enter into a contract and a bond (with two sureties) for the due performance of the work.

The lowest or any Tender will not necessarily be accepted.

Dated this 24th day of September, 1897.
HAROLD A. WINSER,
Clattern House, Kingston-upon-Thames. Town Clerk.

URBAN DISTRICT COUNCIL of BROMLEY.

TO BUILDERS AND OTHERS.
The Urban District Council are prepared to receive TENDERS for the ERECTION of a FIRE BRIGADE STATION and STABLES at West-street, Bromley, in accordance with the plans and specification which may be seen at the Office of the Council's Surveyor.

The bill of quantities and forms of Tender may be obtained on payment of Two Guineas, which will be returned on receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Fire Brigade Station and Stables," must be delivered to me as under, not later than THREE o'clock p.m. on TUESDAY, OCTOBER 12th next.

The Council do not bind themselves to accept the lowest or any Tender.

By order, FRED. H. NORMAN,
District Council Offices, Clerk to the Council.
Bromley, Kent.
September 29th, 1897.

WILLESDEN DISTRICT COUNCIL.

TO ROAD CONTRACTORS.
The Willesden District Council are prepared to receive TENDERS for the EXECUTION of certain ROAD-MAKING and PAVING WORKS in Churchill-road, Willesden Green.

Plans and specification may be seen, and all further particulars obtained upon application to Mr. O. CLAUDE ROBSON, M.Inst.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

The Tenders, upon printed forms, and endorsed "Private Streets," to be delivered at the Offices of the Council not later than FOUR p.m. on TUESDAY, OCTOBER 12th, 1897.

The Council did not bind themselves to accept the lowest or any Tender.

By order, STANLEY W. BALL,
Public Offices, Clerk to the Council.
Dyne-road, Kilburn, N.W.
September 29th, 1897.

TO BUILDERS AND CONTRACTORS.

The Shoreditch Vestry invite TENDERS for the ERECTION of Three Blocks of ARTISANS' DWELLINGS in Moira-place and Plumber's-place, City-road. Persons desirous of submitting Tenders are requested to send in their names to the undersigned, on or before OCTOBER 11th, 1897.

A copy of the bills of quantities will be delivered to every builder desiring to Tender on his sending with his application a cheque, value Five Pounds, when drawings and specifications may be seen at the Offices of the Architect to the Vestry, Mr. ROLAND PLUMBE, F.R.I.B.A., 13, Fitzroy-square, W. The amount of deposit will, when the Vestry has come to a decision upon the Tenders received (but not before), be returned to the Tenderer, provided he has sent in a bona-fide Tender, and not have withdrawn the same.

Contractors will have to observe the trade-union rate of wages and hours.

Tenders, on official forms, must be delivered at the time and in the manner stated in the bills of quantities. The Vestry do not bind itself to accept the lowest or any Tender.

By order,
Town Hall, H. MANSFIELD ROBINSON,
Old-street, E.C. Solicitor and Clerk.
September 29th, 1897.

COMPETITIONS.

CITY OF NOTTINGHAM.

TO LANDSCAPE GARDNERS AND ARCHITECTS.
NEW CEMETERY.
The Public Parks Committee of the Nottingham City Council invite COMPETITIVE DESIGNS from Landscape Gardeners and Architects for the Laying-out and Planting of a new Cemetery at Basford, in the City of Nottingham, and for the ERECTION of the Lodges, Chapels, Crematorium, and necessary Buildings.

It is intended that the competition shall be divided into two portions, A, to be competed for by Landscape Gardeners for the laying-out and planting of the site, and B, to be competed for by Architects, for the buildings, &c.

Premiums of £100 will be paid to the designs placed first, and £50 for the designs placed second in each competition.

The conditions of the competition, with a plan of the site, may be obtained on applying to the City Engineer, Guildhall, Nottingham, on payment of £1, which will be returned on receipt of Competitive drawings, or on receipt of the conditions and plan in case the applicant does not compete.

A WEEKLY ARCHITECTURAL CAUSERIE.

The Changing Architectural Student.

A FEW years ago we should have visited an exhibition of architectural students' works in

a desponding frame of mind, knowing that we should be surfeited with endless copies of ancient examples, without the spirit of the old work, and impossible designs of railway stations in Early Gothic or Renaissance of a feeble nature. But to-day a look at the designs sent in for national competition at South Kensington, at the preliminary studies of the aspirant to architectural fame who would design with beauty and build with truth, and the intelligent efforts in handicraft by members of the Arts and Crafts School, will undoubtedly possess an interest such as was never excited by the scholarly but limp designs of the earlier students. Instead of certain historic styles being applied to any kind of building, regardless of their use, there is a tendency clear and unmistakeable on the part of the students to so arrange their building and material that the design shall be the pleasant outcome of requirements settled for them by the conditions of to-day. Crude and eccentric as their work is at times, a freshness and vitality is present which we failed to find in the earlier attempts. The training of the old and new student, as they may be called, is changed, and it is in this fact that the very different results may be traced. It is not so very long ago that the pupil in an architect's office was invariably given the five orders to draw out, with perhaps a hint that he would do well to acquaint himself with the dates of the "styles," with their characteristic windows, doors, and mouldings, not that he might have a knowledge and certain reverence for past work, but to enable him to face up a town hall or a swimming bath with a style of Architecture learned by rote, and, as a rule, to be generally applied. It was of little consequence that the windows of the "style" chosen gave insufficient light, or that the doors only opened square, providing the design might be classified and labelled Early English, Greek, or something Egyptian, if originality was desired. The twentieth century architect will probably go to his work with a training that relies more on the development of the emotional and imaginative faculties directed by hand and brain, and acting upon materials fashioned to fulfil purposes of a practical nature; beautiful results being obtained by the harmonious arrangement of forms, the natural outcome of actual needs. It is towards such an outcome that the present day student is groping, he is not content as formerly to make designs on paper and to placidly contemplate results; he would know the processes by which the result is obtained, and occasionally find time to assist in the fashioning of his thoughts. It is a pleasant and encouraging fact that the younger architects, and the still more youthful architectural student, may often be found in the sculptor's studio throwing about the clay with more energy than skill, perhaps; at the bench, cutting and carving; or in the warehouse

taking notes, intent on learning methods of construction and the treatment of materials. He is edging away from his respectable and "superior" brother student, and is beginning to learn the joy of executing portions of his work in design, to alter here and there as he fashions it, finding that some other form lends itself more easily to the tool he is using than the one he had shown on paper. Such is the changing architectural student. May he grow in grace and wisdom, with an eye to see, a heart to feel, and a hand to fashion; he will go far.

G. L. M.

Architect or Surveyor?

THE juxtaposition of these two names, when representing a single individual, being so continually before our eyes, brings with it a danger that we should do well to guard against. We are getting so accustomed to them that we shall soon begin to think that there is a necessary connection between the two, that there is something incomplete in the one without the other. When we hear one we unconsciously think of the other

to a confusion between the persons represented, or to a blending of the two into one. We seem to be evolving a new type, which will doubtless be called the "Archiveyor." The "architect and surveyor" differs from the "architect and engineer" and the "architect and artist," whom we have occasionally come across, in that he really combines two distinct occupations, while the latter titles are more or less tautological, as if one were to say "poet and versifier," or "architect and constructor." We are not so much alarmed about these, they are evidently adopted to enlighten the public as to the real qualities and functions of the architect, each man emphasizing the attribute which he thinks is the most likely to be overlooked—or possibly to proclaim to the world what particular function he feels most fitted to perform—though there is always the danger that they may have the opposite effect and mislead the public, who, when it sees architect and artist, may not unnaturally draw the inference that an architect is one thing and an artist another. To mislead the public is bad enough, but to mislead ourselves is worse, and that is what we think this title of "architect and surveyor" is likely to do. We have heard somewhere of a young

APSE OF LADY CHAPEL, ST. AGATHA'S, PORTSMOUTH. J. H. BALL, ARCHITECT.
DECORATED BY HEYWOOD SUMNER.

simply by the continual association of the words; somewhat in the same way as we think of the walrus and the carpenter. There is growing up a fictitious connection between the two names which is apt to lead

American architect who, returning home after finishing his studies in Europe, endeavoured to entice the wary client by means of a colossal brass plate setting forth his qualifications—"Student of the Royal Academy, and

L'ecole des Beaux Arts; for some time with the late William Burges, A.R.A., &c., &c. But clients were coy and hard to please, and it became necessary to do something for a living. Did he put up a still more colossal plate with "Surveyor" inscribed thereon? No. He was a man of original talent—he opened a boot store and made boots, and waited for the goddess of fortune to smile on him at her leisure. At first glance there does not seem to be any connection between building and boots, beyond the obvious one that there is a "B" in both; but to the eye of philosophy there is as much as exists between Architecture and surveying. This American was doubtless a man with a fine passion for construction; if he could not be constructing buildings, he would, at any rate, be constructing something—he would construct boots. The exercise of his instinct for artistic structure would still be possible, and he could console himself with the thought that if the unkind Fates had denied him the opportunity of providing a permanent covering and shelter for the whole body, it was still permitted to him to provide a temporary one for the feet. A man of modesty and real strength is always willing to begin at the bottom—it is vanity and conceit that runs to hats and bonnets.

the eye keen, that will not stifle the instinct for Art or cause the right hand to lose its cunning.

A.R.J.

Architecture at the Royal Photographic Society.

It is not often that an architect has the opportunity of finding out how his Art is viewed by the general public, but such an opportunity presents itself at the moment in the Exhibition of the Royal Photographic Society which is being held at the galleries of the Royal Society of Painters in Water Colours in Pall Mall. Presumably the exhibitors are representative of educated men with an inclination towards artistic tastes, and it is pleasing to note that a large number of the views are of purely architectural subjects. That very few of these are modern is scarcely to be wondered at, or that the few modern examples chosen are atrociously bad. Yet even from this a lesson may be drawn to the effect that Architecture is not considered in the light of a living Art; and that the public fail to see beauty even in that modern domestic style upon which we

want, and we need not introduce, startling and original and elaborate features; they call for repose and peace and beauty everywhere; that is the public as represented by their illustrators, the photographers.

G.A.T.M.

ANOTHER NOTED INN DOOMED.

NOT far up stream from Maidstone, where the Medway runs between two ridges which rise steeply from either bank, is the village of East Farleigh, the Ferlega of the Domesday Book, one of the most ancient sites in Kent, as its name shows. Ferlega means the "place of the way," or "passage," over the river, and there the ancient bridge still remains, picturesque with grey ribbed arches and massive buttresses, the highway now, as it has been for ages, from one side of the valley to the other. Crossing the stream over the bridge from the railway station, the road climbs the southern ridge, on the top of which stands an architectural group suggestive of Old England—the church, mainly of the fourteenth and fifteenth centuries, with its lych gate, and, just across the road, one of those old, half-timbered inns which harmonise so

A CHRISTMAS MAGAZINE HEADING. DESIGNED BY HEYWOOD SUMNER.

But the architect who for the same reason adds surveyor to his professional title has a different sort of consolation. So overwhelmed by his devotion to buildings is he, that if he cannot construct them at least he will survey them, and value them up, and negotiate suitable sites for them, and entice other people to buy and to sell them, and jealously guard their "ancient lights." But there is, to our mind, a certain touch of foebleness, a certain lack of dignity, about this attitude; it reminds one somewhat of the attitude of the jealous, rejected lover. We prefer the attitude of our boot-building brother. Design something he would—if not buildings, then boots. If Art will not favour him he turns his attention to her handmaiden, Craft, then the jealous mistress smiles on him, and the last is abandoned for the pencil and brush. To our way of thinking there is less danger in boot-making than in surveying, and for this reason: that neither the architect nor the public is likely to confuse Architecture with boot-making, while they may confuse it with surveying, and this is a bad thing for both. There is a danger of it being thought that you survey for dilapidations and value for a mortgage, in your capacity as architect, and build a warehouse in that of a surveyor. To those architects who do not find a sufficient living in the practice of Architecture pure and simple—and they are many—we would say, try and fill up your time with something that will keep the brain clear and

are rather apt to plume ourselves. It is apparently void to them of all that sentimentality of homeliness and comfort which so many of us are attempting to invest it with; while the older manor-house, with its creeper and decay, though conceived in a similar spirit, appeals strongly to them. If, however, examples of modern work be absent, almost the same may be said of the Classic and the Renaissance. On the other hand, photographers, at any rate, have not lost their love of the Gothic, and all that is possessed of Gothic spirit, in however a remote degree. The qualities which seem to have appealed to the exhibitors in Pall Mall are mystery, vastness, simplicity, and dignity of tone, together, occasionally, with the merely quaint and curiously interesting. Yet all the best photographs possess the higher qualities just enumerated, and show that their authors would have been quite as willing to have taken views of modern buildings as of old ones had they clearly illustrated these qualities. The public demand, if one may judge from what one sees in this small room, is for a noble, a beautiful, and yet a mysterious Architecture; for buildings which lead one on to peep round corners and try and find new beauties everywhere, and occasionally rest and absorb the simple dignity of simple forms around one. Is it too much to look for these high qualities in modern works? It should not be so; and many of us at least are striving after them. The public do not

well with an English landscape—the Old Bull Inn, now under sentence of demolition. Midway in the road, between the entrance to the churchyard and the timbered front of the inn, is a little group of chestnut trees, and beneath them a mounting block of four courses of stone. For centuries before the days of the bicycle and the steam-engine the traveller bound to Maidstone, to Rochester, or southward to the sea-shore, has mounted his pad nag here after refreshing the inner man at the Bull; and there the worn stones still stand, a humble monument of the days when journeys were made on horseback, and when this charming valley of the upper Medway knew no such sounds as the steam-whistle or the cycle bell. In just such a place as this the wayfaring life of England was for hundreds of years at full tide. The present bridge, old as it is, had many predecessors, for, as we have seen, even before the Norman came the village was known as the "place of passage." Briton, Roman, Saxon, and Norman crossed the river here. On the height above where the present ancient church and inn now stand there stood a more ancient church, and in all probability a more ancient hostelry. Within a fortnight or so this charming little old-fashioned spot will be invaded by the destroyer. The Old Bull is doomed; its quaint and lowly front with its long windows and its pleasant outside seats will be razed to the ground to make way for a new and, no doubt, much smarter and more convenient public-house. Another bit of old England will have vanished.

Men Who Design.

No. 6.

MR. HEYWOOD SUMNER.

FEW of the artistic movements of our time have been more remarkable or more satisfactory than that which is concerned with the reform of English Decorative Art; and never probably has the level of achievement in this branch been higher in this country than at the present time. With this great movement the subject of the present sketch, Mr. Heywood Sumner, has from its inception been closely identified, and, as one of the founders of the Arts and Crafts Society, is entitled to a full share of the recognition which has slowly but surely come to the work of the English School of Applied Art. The strength of this School, and the best guarantee for its permanence, lie perhaps in the fact that it consists, not of disciples grouped round a great master, but of a company of artists of varied individuality and talent united by loyalty to a common ideal, and by faith in a definite and consistent theory of execution.

To say that Mr. Sumner is an artist is to say that he is an idealist. To praise him in print because his ideals are of the loftiest order, because he is uncompromising in pursuing them, or because he permits himself no pattering with his artistic conscience, would not only be improper, but offensive. The plain statement must therefore suffice—to say less would be an act of *suppressio veri*.

Originally educated for the law, Mr. Sumner's natural tastes led him to the study of Art, and since the year 1880 he has made his living as an artist. The first branch of Art that occupied his attention was the pictorial, both water-colour and etching. He has long since abandoned the pictorial for the applied Arts, and the motive that led him to do so is

MAGAZINE HEADING: "FOG AND FILTHY AIR." DESIGNED BY HEYWOOD SUMNER.

not only exemplary in itself, but admirably characteristic of the serious view that Mr. Sumner takes of the mission of Art, and of the duty of those who follow it. At the back of all his work as a pictorial artist was the feeling that Art is the handmaid of man, intended for purposes of social service and the fulfilment of human requirement; and it was the desire to come to close grip with definite human requirement that first led him to take up the applied Arts. Mr. Sumner is convinced of the infinite value to the artist of having some definite problem to solve on given lines; he is fascinated by the restrictions and the possibilities that human requirement brings as it comes along, the delight of combining in the closest union and in the fullest measure the great twin factors of use and beauty. Whether it be for the needs of common daily life or for religious worship the purpose of the work must be always plain to see; its conditions adequately fulfilled, its possibilities of beauty grasped and utilised to the full. In this respect Mr. Sumner endeavours to follow the example of the great craftsmen of the fifteenth and sixteenth centuries, whose work he admires so much. They fired no shots in the air, nor drew bows at a venture, but carefully mastered the human needs of their time, and then marvellously met them.

Mr. Sumner is distinctly one of those artists who have made their public come to them, instead of going to their public. As has been already hinted, his artistic integrity is incorruptible. He believes that it is the artist's business to get people to do what he wants, not to do what they want. While he values clients who know what they *think* they want—and clients do not always do that—his view is that the artist should always give them what they *ought* to want, that is, that an artist should lead his public and endeavour to "go one better" than they require or ask. Consequently, though clients may get what they like, they do not get what they expect. And herein is to be found the great distinction that marks the artist from the tradesman, i.e., that the one places Art before remuneration, and the other reverses the order. The tradesman, who gets a commission, asks himself: "How little can I do for this payment?" The artist says rather: "Here is a chance to put in some good work." The tradesman supplies exactly what his customer asks for, therefore his work never has the air of being *forced upon the public*; the artist, on the contrary, cuts through the cake of custom to give what he knows to be best, without expecting that his client will be able to tell him what that is.

Though the range of Mr. Sumner's work is fairly well represented by our illustrations, yet from their very nature black and white reproductions can often serve for little more than to show the existence of something that should be worth examining in the original. This is especially the case with the reproductions of the sgraffito work at All Saints Church, Ennismore Gardens, and St. Agatha's, Portsmouth, the chapel of the Winchester College Mission. A scheme of colour decoration seen without its colour is painfully misleading and inadequate, and the reader must therefore suspend his judgment until he has seen the substance of which the reproduction is the shadow. Concerning the beautiful and long-neglected Art of sgraffito decoration we cannot do better than quote the following remarks by Mr. Sumner from a booklet published in connection with the work at All Saints Church:—"The wall decoration that goes by the name of sgraffito is produced by laying a thin coat of fine white cement over a ground of cement mixed with colour, and then cutting away the white upper surface, in accordance with the design, so as to reveal the ground of colour beneath.

"Like fresco, each day's work must be calculated beforehand, as the cement sets hard in a few hours; accordingly the cutting of the design and the cleaning up of the colour ground laid bare must be done before the process of setting has advanced.

"The Art of Sgraffito was much practised in Italy during the sixteenth century. It was specially revived by an artist named Morto da Feltri, who appears to have re-discovered the method, in the excavation of ancient Roman antiquities undertaken by the Medici.

"In England it was used in the reign of Henry VIII., but seems to have been forgotten till about thirty years ago, when it was specially revived by the late F. W. Moody at South Kensington, and since then there has been a considerable amount of this work done in England."

All Saints Church is built in the style of the North Italian Basilica, and was originally designed by Mr. Vulliamy in 1849, though it has been greatly altered within the last ten years, and a new west front added, under the

WALL DECORATION AT ALL SAINTS, ENNISMORE GARDENS. EXECUTED BY HEYWOOD SUMNER.
C. HARRISON TOWNSEND, ARCHITECT.

direction of Mr. C. Harrison Townsend. A building in this style is but half complete without a rich and noble scheme of interior decoration; it is the jewel to which the fabric forms the casket. This is the work which Mr. Sumner has most happily begun in a spirit of dignified and restrained design, tempered with rich and sonorous colour, well befitting a place of worship. So far he has completed the east wall over the chancel arch, and the walls of the north and south arches next to the chancel. It is a work the full effect of which cannot be realised until it is complete, but there is quite enough to bear out fully the claim that it is a "new and most valuable departure in church decoration." One eagerly looks forward to the time—probably about a year—when it will be complete, and it will be possible to go to examine the finished work. Congratulations are due both to the artist for the promise shown by what he has already achieved, and also to those responsible for the commission, for the sound artistic judgment and discrimination manifested. It should be added that the central figure over the chancel arch is set in glass mosaic, and the border of the oval that contains the figure consists of a double row of large concave, mother-of-pearl shells, a rather original form of wall decoration. The effect of the light upon these is very curious, especially at night, the figure appearing to be surrounded by a soft luminous halo that seems almost magical. Mr. Sumner's treatment of Prior's glass in the windows must also be mentioned. He has aimed at bringing out the silky qualities of the material, using pieces of coloured glass (not painted), each selected with the utmost care and trouble for the particular place where it was required. He has arranged these in the mosaic manner, in lead lines. The charming accidents that occur in the glass are worked in and made the happiest use of with admirable judgment, and the result is that these windows give an altogether richer and more brilliant result than ordinary painted glass.

As specimens of Mr. Sumner's wall papers, we reproduce the "Fig and Olive," the "Flowery Trellis," and the "Oak, Ash, and Bonnie Ivy Tree," all designed for Messrs. Jeffreys. The latter is a staircase paper, so arranged that it can either be hung straight or drop with each step.

Our illustrations, "St. George and the Dragon" and "Work," are two of the Fitzroy pictures, a series of large prints, some chromolithographed, others coloured by hand, intended for schools, mission-rooms, hospitals, and such-like places of meeting where the walls are barely furnished. This undertaking, of which Mr. Sumner is director, has been a striking success, both artistically and com-

mercially. Associated with Mr. Sumner in the enterprise are C. W. Whall, Selwyn Inage, Louis Davis, and C. M. Gere. In a statement upon the aims of the Fitzroy Pictures, Mr. Sumner writes:—"We think that the schoolroom—the schoolroom of the rich as well as of the poor—should be recognised as a fair field for connecting Art with daily life, and that when there is a desire for simple, vital art on school walls, there will arise a desire that our other public modern buildings should be more worthily and expressively adorned. Thus our ultimate aim touches on the large and intricate question of the spectacle of modern daily life, which has been shaped for so long by men of commerce and men of science." The design "Work" which we reproduce is rather remarkable for the courage shown in attacking artistically a forbidding subject, as well as for the skill with which Mr. Sumner has arranged those terrible parallel railway lines.

We also reproduce three headings designed by Mr. Sumner for Messrs. Macmillan, and a panel portrait of the artist by Mr. Henry Pegram, being a cast of a clay relief intended to be cast in bronze.

LISKEARD CHURCH TOWER.

TO BE RESTORED OR REBUILT?

THE Chancellor of the Diocese of Truro (Mr. Robert Maclean Paul) recently held a Court at the Town Hall, Liskeard, to receive a petition from the vicar and churchwardens of Liskeard for a faculty "to take down and rebuild the present tower, and to erect a choir vestry." The Chancellor was accompanied by Mr. C. E. Ponting, F.S.A., of Marlborough, Wilts, diocesan surveyor for the Dioceses of Salisbury and Bristol, who sat with him as assessor. Mr. Borlase Childs, in presenting the case for the petitioners, explained that the application for a faculty for taking down and rebuilding the tower of the Parish Church was made in open Court, and without opposition, by the vicar and churchwardens of Liskeard. Recapitulating the facts of the case, covering a period of more than twenty

WALL DECORATION AT ALL SAINTS. EXECUTED BY HEYWOOD SUMNER.
C. HARRISON TOWNSEND, ARCHITECT.

years, Mr. Childs explained that in 1876 a movement was set on foot by the vestry for the restoration of the Parish Church. Mr. Richard Coad, of London (who was in the office of Sir Gilbert Scott, one of the best-known ecclesiastical architects of the day), was the architect employed. One of the first points of the inquiry was as to what should be done with the ancient tower, and Mr. Coad reported that for an expenditure of about £200 it could be restored. At that time, however, it was impossible to know the actual condition of the tower, but when the roof of the church was taken off it was found that the tower was of a most defective character, and Mr. Coad then reported that the foundations were so very faulty—in fact, more than faulty—and the damage so very extensive as to render any attempt at

RESTORATION A HOPELESS TASK,

and Mr. T. Lang, the contractor, was directed to carry out temporary work, with the view of rebuilding the tower at a later date. The cost of rebuilding was estimated at £3000. In 1890 a lady of Liskeard died, leaving by her will a legacy of £1000 to be applied conditionally to the erection of a new tower. In 1894 the vestry appointed a committee to inquire into the matter and decide what should be done. There were no prejudged opinions at all as to whether the tower should be taken down or whether it should be restored. The committee thought it right to consider the question of rebuilding the tower, if rebuilding was necessary; because it must be remembered that application would undoubtedly have been made for a faculty, if deemed advisable, as long ago as 1878 if the necessary funds had then been forthcoming. But at that time there was a lack of money, and accordingly the question had to stand over. Miss Pedler's legacy gave an impetus to the committee, more especially owing to the fact that there was a condition which indicated that unless the tower was rebuilt, and the sum of £2000 raised within ten years, the money would go to Truro Cathedral. He wished to emphasise most strongly that, so far as the petitioners were concerned, it was in no sense whatever a fight for £1000 between Liskeard and Truro, which would not be worthy of the town or its associations, but the petitioners felt very strongly, indeed, that if the tower could not be restored and rebuilding was a necessity, they would be guilty of a grave wrong if they did not take steps to secure for Liskeard what was Miss Pedler's first thought—£1000 towards the erection of a new tower. The committee then called in Mr. G. H. Fellowes Prynne, architect, of London, to inspect the tower, draw up a report, and advise it what to do. Mr. Childs read Mr. Prynne's report of April 4th, 1896, in which he stated that while the tower was very dilapidated, "it is perfectly possible to repair and restore it in a satisfactory manner" for £800, including the rehanging of the bells. Having described the various defects, and the method of renovation, Mr. Prynne concluded:—"With such restoration and repairs, I believe the present tower of Liskeard Church could be strengthened sufficiently to last for many generations. The one thing, however, to be most careful about is that the archaeological features are in no way injured. The repairs can be well done without any such injury, and one of the most interesting old towers in Cornwall preserved for many years to come." Upon receiving this report, however, the committee felt that no mere work of restoration would be satisfactory, and came to the conclusion, rightly or wrongly, to make an effort to raise the necessary money for building a new tower, at the same time treating with the utmost reverence and care every single stone which could be looked upon as a point of interest in the old tower—in fact, building a new tower which would re-embodify, as far as possible,

ALL THE ARCHEOLOGICAL FEATURES

of the old Norman tower. The next step was to advertise for plans, introducing, as far as possible, the architectural features of the present tower consistently with the character of the church, and, in response, there were no fewer than twenty-five competitors. The committee called in Mr. Sedding, architect, of

Plymouth, to advise it in the task of selection, and after careful consideration the premium was awarded to one of the designs sent in under the pseudonym "Moorstone." It was naturally a source of gratification to the committee to find that "Moorstone" was Mr. John Sansom, of Liskeard, who was associated with Mr. Coad twenty years ago in the restoration of the church, who had in his mind ideas of what the tower should be, and whose design was really a labour of love. Mr. Sansom's plans introduced into the proposed new tower every stone and bit of old work which, in his judgment, was capable of reproduction. In order that the committee might be still further satisfied in the matter, it asked Mr. Sedding to give his independent opinion with regard to the re-erection, restoration, or entire rebuilding of the present tower. Mr. Childs proceeded to read Mr. Sedding's supplementary report dated January 29th. Having described the present state of the existing tower, Mr. Sedding continued:—"There can be no doubt whatever that the present structure is in a precarious condition, and should be promptly prevented from further dislocation, which would cause the fabric to collapse. It is, I understand, the desire of the committee to heighten the tower some twenty feet, as suggested by the successful competitor. This cannot be done with safety without strengthening the substructure, which is now unable to support itself. Any method far short of rebuilding would be but temporary, for the tower needs a foundation. Underpinning, under the circumstances, I should not recommend, for it would be attended with considerable danger. The only alternative, and, in the end, the most conservative method, would be to rebuild, carefully preserving and marking the old materials (as Mr. Pearson is doing at Peterboro') so that the present tower may be re-erected, as far as it can be done, any new walling stone being in harmony with the old; the 17th century granite facing to be used in the lowest part, with the old plinths. I am quite sure you could have no better man than your chosen architect to carry out this most important work, which, if carried out on these lines, will be one of the most interesting pieces of conservative craftsmanship executed in this county." On that report, continued Mr. Childs, if there was any thought in anybody's mind as to the possibility of the restoration of the present tower, that hope vanished. There seemed but one course open to the committee. It felt that it owed a duty to posterity, and that no work that was not of a permanent character should be undertaken. Accordingly, it set to work

THE "FIG AND OLIVE" STAIRCASE PAPER. DESIGNED BY
HEYWOOD SUMNER.

and made an application for a faculty, which the Chancellor had said he did not see his way to grant except upon certain conditions. It was well, he admitted, that there was a power that could stop work upon our ecclesiastical buildings which some people might wish to carry out. If it was left to the wills of a few irresponsible persons they might even have their cathedrals pulled down, and it was well there was a power to restrain them. But,

THE "OAK, ASH, AND BONNIE IVY TREE." DESIGNED BY
HEYWOOD SUMNER.

on behalf of the petitioners, he asked the Chancellor to exercise the power vested in him to give them a faculty, because they were satisfied, from expert evidence, that the present tower

COULD NOT BE RESTORED

in any way worthily of the town, and that it must be taken down, but, as he had said, not with a view of destroying the interesting features of the fabric, but of carrying out a scheme of "conservative craftsmanship," such as Mr. Sedding recommended. Continuing, Mr. Childs said if the Royal Institute of British Architects had an earnest desire to preserve

an ancient landmark its proper course would have been to send down one of its members to make a careful examination, and then oppose the petition. But it had not the pluck to do that. What it had to say, therefore, was not worth discussing, except that it was an unjust attempt to influence public opinion in Cornwall.—Mr. T. Lang, a builder of experience, and head of the firm of Lang and Sons, contractors, said in 1876 the vestry decided to restore the parish church, and he contracted to carry out the work. A part of the work of restoration was to take off the roof of the church, which was accomplished in 1878. He made a thorough examination of the tower, which he found to be in a very defective condition. He had pits sunk below the tower, chiefly on the south-west side, and found that about 4ft. below the surface they had actually unbottomed the tower. He remarked upon the dangerous character of the structure, and ordered the pits to be filled in with concrete. There was no masonry at all in the foundations of the tower.—Mr. Edmund Sedding, architect, of Plymouth, was then examined. He said he was familiar with Cornish Architecture. He was called in by the tower committee to advise in the selection of designs for a new tower, and after the utmost care had been taken, the premium was given to the design signed "Moorstone," prepared by Mr. Sansom. He recommended the adoption of a compromise between "Moorstone's" main design and his alternative scheme, that the height of the tower should not exceed 80ft., that all the old features of the present tower be reused, of course including the old tower arch—in short, that a scheme of rebuilding be aimed at rather than the demolition of the existing structure. Subsequently he carefully examined the tower, and presented a supplementary report, which he still adhered to, although a recent inspection had convinced him that the foundations were not so strong as he thought they were.—The

Chancellor intimated that he would deliver a written judgment.

A new hotel is to be erected on the front at Sheringham. It will cost £30,000, and be completed for the 1898 season. It will have 101 bedrooms.

The death took place within the past few days at his residence, Copeland Street, Stoke, of Mr. Edwin Penn, a well-known architect in North Staffordshire.

Mr. C. T. Ritchie, M.P., has laid the foundation-stone of the Passmore Edwards Public Library, which is to be erected at 236, Cable Street, St. George's-in-the-East.

DEVONPORT'S DOCKS.

A GIGANTIC EXTENSION SCHEME.

THE Keyham extension works, when complete, will place Devonport in the position of being the finest naval arsenal in the world. Magnificent docks and basins, capable of accommodating the largest battleship afloat, will have been constructed by that time. But a lot of work must be accomplished before that period arrives, and the development and progress of the undertaking will be watched with unusual interest during the interim. As is well-known, the work is being carried out by Sir John Jackson, who, it may be mentioned, is engaged at the present time in new harbour works at Dover, and many other big contracts in this country. The works at Dover were commenced some five years ago, and are now just approaching completion. The Keyham extension was started in January, 1896, and provision is to be made for a large closed basin, which is to cover an area of 35½ acres, a tidal basin, and four graving docks, with a deep loch entrance, allowing ships to enter at all states of the tide. The closed basin is 1550ft. by 1000ft., the tidal basin 1000ft. by 500ft. The whole of the great area necessary for these works seaward has had to be enclosed by a cofferdam of exceptional length and strength.

EXTRAORDINARY LENGTHS OF TIMBER

are necessary, owing to the great depth of mud underlying the site. The cofferdam is composed of piles running from 65ft. to 85ft. long, driven in two rows 5ft. apart, and filled with clay puddle. The timber necessary for this important work has been specially brought over from Vancouver. It is Oregon pine, and has all been brought around Cape Horn. The first vessel with this timber arrived in January last, and nine other cargoes have since followed. Some 13,000 piles alone have been driven in the dam and stagings in connection therewith. When this work is completed the enclosed area now covered by the waters of the Hamoaze will be pumped out, and the great bulk of excavation will be tackled. The vast character of this section of the work will be understood when it is stated that some 10,000,000 tons of mud will be removed from the area and conveyed out to sea. For this purpose six of the largest steam hopper barges are now being built on the Clyde, and very shortly two exceptionally powerful tugs will arrive at Devonport for working this fleet. The preliminary workshops, &c., which the contractor has laid out, have all been schemed with a view to making the maximum progress that a very large quantity of plant and forethought can bring about, once the cofferdam is closed and the area drained. Complete mechanical engineering shops, with foundry and forges, have been erected to enable the contractor to repair and renew the tremendous quantity of plant required with the least delay and inconvenience. The whole undertaking is estimated to cost three millions sterling, and an idea of the value of the plant now on the ground can be gained when it is stated that no less than 80 steam boilers are constantly at work, a large number of locomotives, 50 steam cranes, in addition to pile drivers, steam navvies, steam winches, nine gas engines for driving the repairing shops, and concrete mixing plant, not to mention a fleet of barges bringing

GRAVEL FOR CONCRETE, LIMESTONE, &c.

Very powerful pumping machinery has also been provided, but owing to the almost entire absence of water so far this machinery has had little work to do. But this can hardly be expected to continue. Substantial progress has so far been made with the work, and, judging by the present rate, there seems very little doubt but that the whole undertaking will be carried out well within the contract time. At present some 1500 men are employed on the extension, exclusive of those engaged at the quarries at Oreston, and a couple of hundred men at Weston Mill, where Sir John Jackson is erecting two hundred houses to accommodate his workmen. The staff of workmen will probably be doubled by next

year. By night as well as by day the work is being pushed forward, and the electric light is brought into use by night, no less than fifty arc lamps and upwards of 1000 incandescent lamps, besides a large number of Well's well-known portable lamps, being brought into requisition. The temporary timber alone represents approximately £150,000. These large extension works have been designed and are being carried out under Major Pilkington, C.B., R.E., as engineer in chief, and he is represented on the works by Mr. Whately Eliot, M.I.C.E. Sir John Jackson's chief agent is Mr. G. H. Scott.

TECHNICAL EDUCATION IN THE EAST END.

IT was a happy thought, indeed, which prompted Sir Walter Besant to write "All Sorts and Conditions of Men," the justification for which is amply evidenced year after year at the People's Palace in the Mile End Road, and was most powerfully demonstrated a few evenings since, when the students' annual conversazione was held and was participated in by some 3500 persons, whose enjoyment was ministered to by Mr. W. E. Steadman, L.C.C., Mr. J. L. S. Hatton, the Director of Studies, Mr. C. E. Osborn, the secretary, and others. The programme was arranged and carried out under the direction of Sir John H. Johnson, chairman and treasurer of this East London Technical College, with which, by the way, has been amalgamated the old Bow and Bromley Institute. Besides chemical and telegraphic demonstrations, wood-carving and book-sewing were shown in actual operation, and these, together with the microscopical, engineering, and joinery sections, attracted considerable attention. The Art school, and engineering, chemical, electrical, and physical laboratories were thrown open for the inspection of visitors, and demonstrations were given in the Röntgen rays. Leaving the lighter for the more serious objects of this very admirable institution, we would remark upon the excellent quality of the work executed in the joinery section, as evidenced by the specimens in view, some of which were executed by very youthful students. Among the work which we particularly examined were some king posts for roofs, doors, and panels, and some inlay work, much of which is very neat and well executed, the operators having steered

CLEAR OF OVER-ELABORATION.

In the wood carving division were several excellent specimens of the handicraft, the workmen in which had displayed some very welcome departures from the usual designs. One panel, a quartrefoil, with a floral design, executed by a lad of sixteen, gained a London County Council scholarship, and is decidedly promising. Much satisfaction was expressed by visitors at the complete manner in which the Art school and the various laboratories and schools were fitted up for both the day and evening classes, and there can be no question but that the educational and social influence of the People's Palace is a large power for good in the East End of London. Coming now to the Calendar which has been issued for the 1897-8 session, whose work may be said to have been inaugurated by the conversazione above referred to, it may be cited as especially worthy of imitation in other industrial centres, that, in addition to the usual subjects provided by

THE FLOWERY TRELLIS WALL PAPER. DESIGNED BY HEYWOOD SUMNER.
BY PERMISSION OF JEFFREYS AND CO.

polytechnics and such-like educational institutions, there are trade classes (in which People's Palace trade certificates are awarded) held in plumbing, in which those portions of the various science subjects with which the trade is connected are studied and explained; in tailors' cutting, in which the teaching is individual as far as possible, the instruction practical, and as simply put before the student as the subject permits; in carpentry, joinery, and cabinet-making, in which the students are taught to work in the shop to detailed drawings; in brass work and scientific instrument making, in which particular attention is given to the making and use of electrical apparatus; in bookbinding, the workman being taken through the complete course of binding books and music, beside cleaning and restoring, map and photograph mounting, and finishing in all styles; in house painting, decorating, and sign writing and graining—a very necessary course, in a knowledge of which many otherwise efficient workmen are lamentably deficient, and in which instruction is given in the principles of letter writing, including different styles and ornamental lettering, gilding, shading, &c., together with graining in imitation of woods and marbles; in pattern making, and in practical smith's work. It will be seen from

this brief synopsis that the workers of the East End are well provided for in many of the trades with which they are the more immediately associated, a remark which also applies to the women workers, whose subjects do not come within the purview of this journal. Referring to the future, it may be mentioned here that, following on a very successful exhibition of Art which has been recently closed, on October 25th a Diamond Jubilee exhibition of trades and inventions will be opened, and so remaining till January of next year. This exhibition, which is being promoted by Mr. Hills, of the Thames Iron Works, will especially appeal to East End workers, as it will be largely representative of those industries therein pursued, the exhibition promising to be particularly strong in all that pertains to shipbuilding and ship's work, while

INVENTIONS.

by working men will also be very largely to the fore, Mr. Osborn having received many such already, several of which are decidedly clever. Among the professions and trades which are to find a place in the exhibition are Architecture, building, joinery, shipbuilding and engineering, electrical and other lighting, textiles and clothing, food and confectionery, toys, fancy goods, and gold and silverwork, clocks and jewellery, pottery, glass, &c.; furniture and decoration, printing, publishing, bookbinding, &c.; musical instruments, boots, shoes, and leather goods; brush, basket, and cane work, and brass and metal work, cutlery, and ironwork. We purpose dealing with the Exhibition in a future issue, and in the meantime we would congratulate the executive of the People's Palace and college and schools upon the good work it is accomplishing among the toilers of the East End.

At Barmouth a sheriff's officer took possession of the offices of the District Council for a claim of £1800 made by the contractors of the drainage works.

MAGAZINE HEADING. "CATCH ME WHO CAN." BY HEYWOOD SUMNER.

EFFINGHAM HOUSE, ARUNDEL STREET,

October 13th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

WE are glad to be able to announce the fact that the scheme for the decoration of the interior of the Royal Exchange is rapidly approaching completion. The ninth picture—that presented by Sir Samuel Montagu, Bart., representing Charles I. demanding the surrender of the five members at the Guildhall—is almost complete, and will be unveiled by the Lord Mayor very shortly. It is from from the brush of Mr. S. J. Solomons, A.R.A., whose pictures have from time to time proved valuable acquisitions to Art loan exhibitions at the Guildhall Gallery. Mr. Deputy Sayer hopes to be able to induce another of the large and wealthy livery guilds to contribute to the series of panel paintings.

WE understand that the new wing of the Admiralty buildings, the erection of which is being rapidly pushed forward, will be devoted to the medical and other branches of the department, which at the present time are scattered in all directions over Spring Gardens and Whitehall. The new block, which adjoins the First Lord's garden, will, when completed, connect the old and the new Admiralty buildings. Preparations are also now being made for clearing the Carrington House site in Whitehall, upon which the new War Office is to be erected, and when these important buildings are completed it is probable that they will be connected with the Admiralty by a subway beneath the street.

It needed a great fire to clear away the disease-smitten rookeries of ancient London. It needed two or three visitations of cholera to start London sanitation. And it looks as if London just now needs a typhoid epidemic to take her water supply firmly and once for all in hand. The Maidstone epidemic, which most of the medical authorities attribute to polluted water, is still spreading rapidly. Neither in London nor in any other town that is, was, or shall be, will profit-mongers in water take more precautions against disease than they are forced to.

A RESIDENT in Beechdale Road, Brixton, writes:—"The street in which I reside abuts on the main thoroughfare of Brixton Hill, and contains nearly 100 houses, all of which have been occupied as fast as they were constructed. The road, from a building point of view, was completed in the spring of last year, and I indulged hopes that the Vestry would promptly take it over with a view to its being duly made up and paved. However, in such matters the parochial mind moves slowly, and it was not until the following November that the various owners received formal notices calling upon them to pay their respective shares of the estimated charges. Many of them, to facilitate matters, paid in full, others, of a less sanguine turn of mind, in part; and in the spring of the present year were duly hauled before the magistrate at Lambeth Police Court and ordered to disburse the balance and costs forthwith. The financial outlook, therefore, especially from a Vestry

point of view, may be considered satisfactory, but there the matter has rested, and although we are now approaching the end of the year, nothing in the way of making-up the road has been attempted.

It is not everyone in the Profession, perhaps, who knows that the closing years of Wren's work at St. Paul's were darkened by wrongful and insulting treatment. There had been a Commission appointed to superintend the progress of the works. An idea took possession of their minds that Wren wanted the work prolonged as much as possible in order that he might continue to enjoy his sumptuous salary (£200 a year!) as architect. Accordingly, three years before the close of the seventeenth century, a clause had been inserted in an Act of Parliament which had authorised them to suspend payment of one half his salary till the work was finished. But, says a writer in "Cathedral Churches," disputes about money were not all; the Commissioners continued to meddle with the work, and to thwart the architect. Contrary to his strongly expressed wishes, they cooped up the cathedral within an enclosure consisting of a stone wall surmounted by a heavy cast-iron railing. They insisted upon crowning the side walls of the cathedral with a balustrade, since this, to quote Wren's words, "was expected by persons of little skill in architecture," and by ladies, who "think nothing well without an edging." At last, as the result of a miserable Court intrigue, they obtained from George I. the dismissal of the illustrious architect from his office of Surveyor of Public Works. Wren, then in his eighty-sixth year, but in full possession of his faculties, bore this ill-treatment with equanimity, retired to his house at Hampton Court, and resumed his studies in philosophy and theology, until, four years later, he passed quietly away from this world.

SHOREDITCH is not to have a monopoly of the economical arrangement by which the furnaces at the dust destructor generate steam for the electric lighting engines. As a result of the investigations undertaken in many of the principal towns by the special committee appointed by the Fulham Vestry to consider the best means of disposing of the dust and refuse of the parish, it has been determined to follow the plan adopted in Shoreditch. At first provision is only to be made in Fulham for the destruction of one-half of the parish refuse. It is probable that the same method will be adopted at Brentford and in Newington.

Two more blocks of buildings are about to be commenced on the Boundary Street scheme of the London County Council. Tenders have been received for setting up a bandstand on the summit of the terraced garden, and for building the flights of steps leading up to it. There is a further large amount of work for which plans have long been ready, but which the Committee have delayed for further consideration. Since this scheme was originally drawn up there has been a considerable rise in the price of labour and material, and the Committee is now revising its calculations. The transformation thus far effected in this locality is marvellous. What was perhaps the vilest rookery in all London has become one of the brightest and pleasantest of working-class neighbourhoods.

THE City of Pittsburg, U.S.A., will in time, thanks to the generosity of one of its inhabitants, possess probably the finest collection of modern Art in the whole world. A fund is now available which will admit of £10,000 a year being spent upon pictures. The programme which has been adopted is both elaborate and costly. A deputation will visit Europe each year and select pictures for an exhibition to be held at Pittsburg every autumn, the first opening next month. From this exhibition a jury of two artists of note from each country represented will select pictures to the amount of money at their disposal, the jury visiting Pittsburg and having all their expenses paid. The two British artists who have been asked to form the English delegation at the first exhibition are Mr.

Orchardson and Mr. Swan; but the former has had to decline the honour. The works sent from Great Britain to this opening show are by no means representative or worthy of the school—a remarkable fact, considering that such outlets as this for the disposal of pictures should be greedily grasped at, especially as purchases will certainly not be confined to those for the Trust, and an acquisition by the Trust would probably mean the artist being adopted by the American public.

A CASE which recently came before the Chancellor of the Diocese of York is worthy of note. The vicar of South Cave, before he had been in the parish a couple of years, proceeded to erect a carved oak communion table and reredos in the church. The former was in substitution of one which had been designed by Mr. Pearson, R.A., when the chancel was recently restored. The latter, which included a cross, was arranged so as to partly obscure an east window of fine old glass which had been brought from Holland by one of the ancestors of the lay rector and patron of the living—a lady who had presented the parson in question. The Chancellor severely commented on his conduct, and condemned him in costs.

A CORRESPONDENT challenges the vicar of Folkestone to give proof that the bones preserved in his Parish Church, and which have been recently exhibited there, are those of the late St. Eanswythe, as claimed. Mr. Harry Hems has come to the rescue. He writes:—"As I was practically the person who found them, perhaps it may be as well to record what little I know on the subject. In June, 1885, members of my staff were engaged in arcing the sanctuary of the church in question (SS. Mary and Eanswythe, Folkestone), with polished alabaster and costly marbles. To further this work, on Wednesday morning, the 17th of the month, we were constrained to remove some small portion of the original Norman, or, may be, early thirteenth century, north wall within the sanctuary in question. This was being done, under my personal supervision, as tenderly as possible, when suddenly we espied, deeply embedded in the rubble, a leaden casket. Upon careful removal it was seen to measure 16in. long, 10in. wide, and 6in. deep. Chastely ornamented with geometrical and diapered enrichment, it had fastenings of lead encircling it to keep the lid securely closed. Within we found some female bones, consisting, in the main, of the upper portion of a skull, two thigh bones, some finger bones, and a beautifully white tooth."

"THE 'find' created great interest amongst archaeological circles at the time," Mr. Hems continues, "and was considered by learned antiquarians to be one of the most valuable discoveries of the kind ever made in Kent. Circumstances suggest the bones were the remains of the Saxon Princess Eanswythe, originally buried in the long-ago destroyed Chapel of St. Peter, in the priory she founded in the sixth century on Folkestone's cliff. When the encroaching sea wrecked this priory, the old historian Lombard tells us, the saintly relics of the foundress did not share the fate of the fabric, but were removed to the new building on the site of the present Parish Church. There, close by the altar, they are believed to have rested from that long-ago day, almost undisturbed, until unearthed by myself in the unexpected manner described on a bright and sunny June morning twelve years ago. No doubt they were originally in a handsome shrine. The battered condition in which the leaden box was when we found it was probably due to the fact that during the time of Oliver Cromwell it is recorded many acts of sacrilege were committed in the Parish Church. The shrine of St. Eanswythe fared as badly as the rest; the coffin was probably torn open and rifled of any valuables it contained, and then thrust into its resting-place and built up in the position recorded. In due course we made a handsome reliquary of veined and polished marble, and fixed it on the precise spot where the discovery was made, and therein

the bones and their casket were piously placed, and there they have since continued to remain. We must not overlook the fact that when St. Augustine first came to preach the Gospel in Kent, St. Eanswythe, the little granddaughter of King Ethelbert, who was converted by him, came to Folkestone, leaving behind her the Court and all its fascinations. There, by the seashore, she remained, spending her life in prayer and good works, and at Folkestone she died."

LAND hunger is a malady from which East Finchley is happily free. Its existence would, in fact, be an absolute anomaly, since eligible freehold building sites in that locality are regarded as of such trifling importance as to be scarcely worth looking after. A gentleman of Shepherd's Bush, who claims to be the proprietor of part of this land, strolled up, after a year's absence, to glance at his ancestral estate, and was somewhat surprised to find that it had nearly all been dug away. Peering into the abyss, which was once a building site for a bijou villa, he saw half a dozen men digging with great industry. In his amazement he shouted to them to stop, but they laughed and jeered at him, and said they were entitled to cart away as much of the sand as they liked. The owner of what remained of the freehold called a policeman, who conveyed two of the diggers, by name William Reid and Henry Coleman, both labourers, before the Highgate Magistrate on a charge of illegal excavation. Mr. Forbes, solicitor, who conducted the defence, maintained that this was in reality a kind of No Man's Land, from which people had been accustomed to take sand from time immemorial. A legal discussion ensued, in the course of which doubts arose respecting the freeholder's proprietary rights over the sand taken away, and ultimately the charge was withdrawn on the two men agreeing not to dig any more. By this arrangement the remains of the eligible site will be rescued from total disappearance.

MR. G. FRAMPTON, A.R.A., in an interview in this month's *Idler*, observes:—"Every memorial should, to my mind, not be a carved statue of the man himself, but it should embody his life and chief characteristics. Myself, I always endeavoured to reproduce the man's actual personality." "This," Mr. Frampton observes, "I see exemplified in the memorial Mr. Frampton is just completing of Mr. Charles Mitchell, which is not wanting in dignity or individuality. It represents all the characteristics, aims, and ambitions of the subject. His Profession is denoted by the two ships, his aims by the orange trees which branches upward, whilst on either side are representations of the church and the tower and hall of the Aberdeen University he built, surrounded below by emblematical figures denoting the man's personal greatness—Charity, Truth, Energy, and Science, and above all towers a figure with an olive-branch."

THERE can be no greater proof of an artistic advance "all along the line" than the greatly increased attention paid to the applied Arts. At the last Spring Exhibition in the Leeds Public Art Gallery considerable space was given up to objects coming under this description, and it is satisfactory to know that it is hoped to extend this section next spring. Wood carving is one of the most generally practised of the crafts, but often with more zeal than knowledge. For those who want to become acquainted with the technicalities, a handbook by Messrs. H. Rogers and J. W. Darnborough will prove useful. Of course, practical demonstration is the best form of instruction in a craft like this, but "The R. D. Scheme of Wood Carving: Elementary Course" (Simpkin, Marshall and Co.) is one of the most business-like text-books we have ever seen. Without wasting time upon historical or æsthetic discussions which, however interesting, would be irrelevant for the present purpose, it goes at once into a practical discussion of the half-dozen tools used in the course, and the important detail of how to sharpen them. Then we have a series of

twelve exercises, in a graduated scale of difficulty, and introducing the six tools in order, so that the student may master the use of each before proceeding to another.

THE London County Council has adopted a motion instructing the Parliamentary Committee "to take the necessary steps to insert a clause in one of the Council's Bills empowering the Council to purchase or contribute towards the cost of purchasing or otherwise incur expenditure in connection with the preservation of buildings and places of historic or architectural interest."

WITH no further formality than a private reception, there was recently opened the splendidly equipped laboratory which the Crown Office of Works has built for the important analytical work required equally by the Inland Revenue Board and the Crown Contract Department. Hitherto these labours have been carried on in very unsuitable surroundings at Somerset House. While the laboratory has required better facilities, the space occupied there has been sorely needed for other uses, and in 1895 Professor Thorpe, director in chief in this department, was charged with the erection of a suitable building. A convenient site in Clement's Inn Passage, near to the Law Courts and King's College Hospital, was secured, and under Professor Thorpe's constant supervision the Office of Works has reared a simple but dignified pile, in which every possible appliance that science and delicate machinery can afford to analytical inquiry is to be found. The entire cost is estimated to be somewhere between £25,000 and £30,000 and the staff will be about sixty, while provision is also made for the assistance of the students in this branch of science at South Kensington. The enterprise is an especially interesting one when it is borne in mind that the new laboratory is the first institution of the kind built by the State in this or any other country, and if not heralded by any flourish of trumpets, or ceremonial opening, it only goes to show how quietly and unostentatiously the British Government carries out its most notable achievements.

THE work of students at the Art Schools of the London Polytechnics, both in artistic quality and skilful execution, has made a vast improvement lately. Recently the authorities of the South Kensington Museum were so pleased with the work of one student, only sixteen years of age, that they purchased it for the National Collection. The work in question was an original panel designed and executed in wood-stains, by Mr. F. Wilkins, a student of the Art School of the South-West London Polytechnic.

MR. ASHLEY HONEY, of 93, Brixton Road, writes:—"There is a class of historical relics which cost nothing to preserve, but which are apt to suffer from the acts of the unthinking, and cannot be restored. I refer to the sepulchral tumuli which crown the hill tops of our heaths and downs. On visiting recently the four round barrows on the top of Banstead Downs, near Sutton, I found that they had been partially demolished, apparently for the earth and turf. One in particular is covered with human bones which have been disinterred. I feel that it is not seemly that the remains of the ancient dwellers in England—our predecessors, if not our ancestors—should be treated with such scant courtesy."

THE town of Nottingham, which has just been entertaining the Church Congress, is full of interesting memories; but, unfortunately, very few of its old edifices have escaped demolition. There are some old houses round its famous market-place, but they have been refronted and stuccoed till most of their ancient charm has been lost. A number of interesting old houses in the centre of the town have recently been sliced away to make room for the new station of the Great Central Railway. Even the Castle, where the mayoral hospitality is so often dispensed, is ancient only in its site. It stands on a high rock, honeycombed with tunnels and the remains

of secret passages which once communicated with the Castle. It was here that Charles I. first raised his standard in Civil wars. The Castle was, however, taken by the Parliamentary army under Colonel Hutchinson, and an old ale-house under its shadow still bears his name as its sign. The Castle remained in the hands of the Duke of Newcastle, though in the last century the houses in what is now Castle Hill were erected on a portion of its grounds. In the Reform Bill riots of 1832 the Nottingham mob was exceptionally violent, and the Castle was sacked and burnt. It long remained in this condition, but ultimately the site was purchased by the Corporation, who rebuilt a portion of it in something of its former style, and laid out the grounds as a pleasure garden. Some of the blackened beams of the old Castle may still be seen outside. Inside, in happy contrast, is a municipal museum and Art gallery.

How few probably are aware that within a few yards of the Strand stands one of the most interesting of the relics of Roman London—a bath that is 2000 years old, and that is still used for the purpose for which it was built? It is reached, says the *English Illustrated Magazine*, by Strand Lane, a small passage opposite the east end of St. Mary's Church, and a few yards east of Somerset House. Some twenty yards down this alley, on the left hand will be seen a small, unpretentious-looking building, behind a row of iron railings. Descending a few steps, and passing through an inner wooden doorway, recently erected, we shall find ourselves in a narrow vaulted passage; through an arch on our left we enter. Here, in a vaulted chamber some 16ft. in length, 16ft. in height, and 9ft. in width, lit by a single oval window at its western end, is the historic bath which was probably built either in the reign of the Emperor Titus or of Vespasian—nearly 2000 years ago. The bath is sunk in the ground to a depth of 4½ft. Its length is about 13ft. and the width 6ft. At the north-east end within the bath is a small flight of steps, round which the water rushes in—beautifully clear, cool, and pleasant to the taste. Some 26,000 gallons pass through the bath daily, the supply being derived from a perpetual spring, the source of which is believed to be the old Holy Well which gives its name, though not its cleansing quality, to Holywell Street, hard by. A waste-pipe inserted in the bath carries off the overflow of water. On the west end of the bath the old Roman bricks still remain to attest the antiquity of the structure. The other three sides are now lined with the marble that was taken from what was known as the Essex Bath until its destruction in 1893 to make way for the buildings of the Norfolk Hotel. The Essex Bath was built, so some assert, in 1588 by the Earl of Essex. It was a fine marble plunge bath, supplied with water from the Roman Bath by means of a leaden pipe. Nothing of it remains but the marble linings already referred to.

THE superior Jury at the Brussels Exhibition has confirmed the awards made to the following British artists:—*Médaille d'Honneur*, L. Alma-Tadema, R.A.; first-class medals (painting), Frank Dicksee, R.A., E. J. Gregory, A.R.A., Seymour Lucas, A.R.A., H. Herkomer, R.A., Sir J. D. Linton, P.R.I., J. W. Waterhouse, R.A., J. C. Hook, R.A., J. S. Sargent, R.A., E. Onslow Ford, R.A., (sculpture); Second-class medals (painting) W. Q. Orchardson, R.A., S. J. Solomon, A.R.A., J. Aumonier, R.I., G. Clausen, A.R.A., Charles Green, R.I., D. Murray, A.R.A., Mrs. Allingham, R.W.S., R. Macaulay Stevenson, J. Lavery, J. W. North, A.R.A., W. W. Ouless, R.A., J. L. Pearson, R.A. (Architecture), G. Frampton, A.R.A., (sculpture) A. Drury, D. Y. Cameron (engraving). The exhibition authorities have purchased the picture "Apple-blossom and tulips" by Alfred Parsons, A.R.A., for the Grand Lottery.

THE Art Gallery Committee of the Manchester Corporation has passed the following resolution:—"That as, without preventing the adequate exhibition of the permanent collection, it is not possible to give to any

temporary exhibition more than four rooms, a number wholly insufficient for the autumn exhibition as hitherto held, such exhibition be abandoned, and its place taken by temporary exhibitions, open free to the public, as an addition to the permanent collection.' The building now known and used as the City Art Gallery was erected in 1830 for the Royal Manchester Institution, raised by Manchester merchants and other influential residents defraying the cost, which was about £30,000. Annual and occasional exhibitions of works of Art, the Committee goes on to state, were held; the nucleus of a permanent collection of pictures was gradually formed; and in time the annual exhibition of the Manchester Academy of Fine Arts also found a home in the building. In the year 1882, by special Act of Parliament, the governing body of the Royal Institution handed over the building and its contents to the Corporation under certain conditions, which included (a) representation of the Governors on the Art Gallery Committee; (b) the appropriation for twenty years of the sum of £2000 annually out of the city rate, and the profit on exhibitions held in the building, to the purchase of pictures; (c) the reservation to the Governors of certain privileges enjoyed by them. The Act also provided for the alteration and extension of the building, and for its sale and the substitution of other buildings if desirable. The Art Gallery Committee, thus formed, continued the annual and occasional exhibitions, and the annual exhibition of the Manchester Academy continued to be held in the gallery. But, as had been foreseen from the outset, the permanent collection began to encroach upon the space available for the autumn exhibition; and, although by structural alterations three rooms have been added to the galleries since 1882, it has now become impossible to accommodate the autumn exhibition, except at the cost of crowding the permanent collection into little more than half the space needed for its satisfactory exhibition; and every addition to the permanent collection, whether by gift or purchase, will add to the difficulty. The permanent collection is now valued at about £50,000. It is one of the best of its kind out of London, and includes important works by many of the principal English painters."

THE Art Gallery Committee's report continues:—"It is frequently alleged in the press that the earlier exhibitions were better in average quality than the recent ones, but the contrary opinion is also strongly held. Upon this point the Committee must be silent. But this much may be said: Several commanding personalities have been removed from the world of English Art, while others are not producing as much as formerly; and these gaps have not as yet been filled up. Two or three works by these men would make an exhibition popular; and such works are not now available. (e) The decrease in the available space has led to a decrease in the number of exhibits, and quantity, as well as quality, counts for a great deal in the popular estimate. The above are probably the chief causes of the decline in popularity of the exhibition. The facts themselves are suggestive; they are also constantly quoted in the press and by visitors to the Art Gallery. It should be observed, however, that the decline of interest in the autumn exhibition is not in itself considered by the Committee a sufficient reason for its abandonment, but simply a reason for not sacrificing the permanent collection for the autumn exhibition when there is not sufficient accommodation for both. The Art Gallery Committee will be only too glad to continue the autumn exhibition if a new gallery is placed at their disposal for the purpose; and with adequate accommodation the exhibition would doubtless be more successful than in recent years. With a new and well-arranged gallery the Committee would be able not only to offer to the public better collections of oil paintings, but also to do justice to water-colour painting and sculpture, the treatment of which hitherto has inevitably been miserably inadequate. The need for such a new gallery is admitted; but, in view of the financial position of the city, the Committee

do not feel justified themselves in urging the Council to build one. They feel that, under the circumstances, this is a matter in which the public and the Council itself should take the initiative. Assuming, then, that the Committee will have for the next few years only the present gallery at their disposal, they see their way to make the following use of it:— (a) The adequate exhibition of the permanent collection; (b) the annual exhibition of the Manchester Academy of Fine Arts; (c) a small annual exhibition (free) of selected oil paintings; (d) an annual exhibition (free) of selected water-colour drawings. Exhibitions of sculpture, historical exhibitions, black and white exhibitions illustrating foreign schools of Art, and Arts and Crafts exhibitions, would only be possible by giving up the water-colour or the Academy exhibition; and could for the most part, be only very limited in extent. Such a restricted programme as is suggested above will only be possible, however for a few years longer, as the whole of the present gallery will soon be required for the permanent collection. The proposed change would involve increased annual expenditure. The autumn exhibition has more than paid expenses on the average; the profit going to the picture-purchase account. But the free exhibitions now suggested would have to be paid for out of the city rate."

A LARGE and influential meeting of merchants has been held at the London Chamber of Commerce, Eastcheap, for the purpose of petitioning the Commission of Sewers to widen the eastern end of Lower Thames Street, where a daily congestion of traffic exists in connection with Billingsgate Fish Market. For some time past the inhabitants of the ward have been agitating for the widening of the street from Fish Street Hill to Botolph Lane, and the meeting resolved to appoint a deputation to wait upon the Commission of Sewers with a memorial in favour of the widening of the street, the cost of which is estimated at over £100,000. The widening of Upper Thames Street has just been completed at a cost considerably in excess of the above amount.

WEST SMETHWICK PARK of more than fifty acres was presented to the public two years ago by Mr. James T. Chance, J.P., D.L., who bought the land for it, laid it out, and endowed it at a cost of about £25,000, in memory of his long connection with the district. An interesting ceremony took place in the park on Saturday week in the unveiling of a bust of Mr. Chance. The bust, in bronze, is the work of Mr. Hamo Thornycroft, R.A., and the likeness is excellent. The architectural support for the bust, designed by Mr. William Henman, F.R.I.B.A., is a pedimented screen in red brick and terra-cotta, with oval recess to receive the bust, which stands upon an ornamental bracket below which is a bronze inscription tablet. On either side of the central feature there are wing walls curving forward protecting seating of deep buff terra-cotta. The whole structure is mounted upon red Aberdeen granite steps, and being backed up by trees and shrubs, forms a very ornamental addition to the park buildings.

A VERY interesting antiquarian and geological discovery is at present in progress in the Isle of Man. A fortnight ago traces of fossil remains of the extinct great Irish elk (*Megaceros hibernicus*) were discovered in the marl beds in the west of the island by certain members of the Isle of Man Natural History and Antiquarian Society. Since then the ground has been trenched, with the result that the antlers and ribs of a superb specimen of the animal have been laid bare. It is expected that a complete skeleton will be disclosed. Last year the British Association made a grant in aid of the cost of the search.

THE new municipal electricity supply works erected by the vestry of Hammersmith were formally brought into operation last week. The distribution of electricity is arranged on the high pressure alternating current system. The current is generated at the central supply

station in Fulham Palace Road, at a pressure of 2000 volts, and distributed to six substations, where it is transformed to a low pressure current of 110 volts. There are in all four dynamos, three of the Ferranti disc type, and one of Ferranti's revolving field magnet type. The former are each driven by a vertical compound engine made by Messrs. MacLaren, of Leeds, the alternator being placed between the high and low pressure cylinders. The speed is about 150 revolutions a minute, and each dynamo can light 4000 eight-candle power lamps. Steam is supplied by two Badcock and Wilcox water-tube boilers, a type which has been chosen as being best adapted to raise steam quickly in case of fog causing a sudden demand for current. The fourth dynamo, which can light 750 eight-candle power lamps, is intended for use in the day time, and is driven by a compound engine made by Messrs. Bellis, running at 450 revolutions a minute, the steam being provided by a Lancashire boiler. The exciting current comes from a small continuous current dynamo carried on the main dynamo shaft; the exciters of the large alternators are driven by ropes from the governor drum. The lighting of the main thoroughfares is by Brockie-Pell arc lamps, which are supplied with continuous current by means of three of Ferranti's patent rectifiers. The lamps are placed from 70 to 110 yards apart, and give about 1200-candle power each. Fixed on the same standard are two incandescent lamps of 32-candle power, which are intended for use after midnight, and are automatically lighted by means of Edmunds' patent switch should the arc lamp go out. Private consumers have their choice between two scales of charges—they may either pay 6d. a unit for two hours' maximum demand, and 4d. for each unit additional, or 2½d. a unit, with an additional fixed charge of 1s. 3d. a quarter for each lamp demanded. For ordinary and irregular consumers the former scale is said to be the more suitable, while large and constant users of current will find the latter advantageous. The total cost of the installation has amounted to about £40,000. All the buildings and plant have been so arranged that they can be economically extended to meet a largely-increased demand in the future, and the mains have been laid in such a way as, it is hoped, will obviate the necessity of again disturbing the streets for many years.

THE new Weights and Measures Station occupies a very prominent position in the road leading down from High Street, Shoreditch, straight to the central raised garden. The building is itself a picturesque and interesting one, and forms a very effective embellishment of this broad avenue leading down into the heart of the new estate. Curiously enough, the one great disfigurement of the portion of the scheme now completed is a Board School. This was one of the earliest set up in London after the passing of Mr. Forster's Act, and it had to be left when all the slums around it were swept away, and brought as well as circumstances permitted into the general plan. The school, as a building, is already out of date, and so far behind the best of London schools that at no very distant date it should be rebuilt.

THE admission of pictures to the walls of Protestant churches will always be a debatable improvement, but the Dean and Chapter of St. Paul's have determined to test the feelings of the public on the question. They have accepted Mr. Watt's "Time, Death, and Judgment," and propose to hang it in the central nave near the north-west quarter arch of the dome.

THE large organ at St. Paul's is silent. It is only for a time, however. This is due to the fact that a thorough renovation is in progress, the action being made as perfect as the most up-to-date methods will allow. Among other additions is that of a celestial organ in one of the alcoves of the dome, the connection with the large instrument being made by electricity. A similar improvement has been made in the Westminster Abbey organ, the additional instrument being erected in the triforium.

III.

CARE should always be taken to place the ventilating pipes in such positions that the longest length of drain may become ventilated, but giving precedence wherever possible to those drains which convey the foulest matter. Thus, had the outside w.c. been attached to a wall which continued up to the entire height of the building, it would have been better to have ventilated the drain connected therewith; but as the scullery and w.c. are only one story in height, this was inadvisable, as the presence of a ventilating pipe so near and below the upper back windows of the house would have been attended with inconvenience and danger. The length of unventilated drain being short, however, and the w.c. well away from the house, and communicating only with the garden, no danger or unpleasantness would be likely to accrue.

The above principle of ventilation for the longest lengths has been adopted with the drains in front of the house. If each of the down pipes had terminated in trapped gullies, and been separately connected to the intercepting chamber, there would have been two short lengths of unventilated drain. To avoid this, the R.W.P. near bay window has been taken into an untrapped gully, and this gully connected by a short drain with the trapped ditto. The untrapped gully being provided merely for the purpose of obtaining access to the drain if necessary, is fitted with a closed top, and the drain becomes ventilated by the air which enters through the grating of the trapped gully, and passes out of the R.W.P. at its point of juncture with the eaves gutter. The drain being short, and used only for rain-water, no inconvenience from smell is to be apprehended, particularly as the outlet is on a level with the roof, but with a longer drain or a gutter outlet immediately beneath a window it would be better to trap the gully and leave the drain unventilated.

A few words as to the junction of the ventilating pipe with the drain. The junction should be made at the top of the drain pipe, or, if this is not possible, in such a manner as to prevent the ventilating pipe becoming choked by the passing matter within the drain.

Ventilating shafts must be of the same diameter as the drain to which they are connected. In the case under consideration this shaft is constructed of 4in. circular cast-iron socketted pipes, jointed with red-lead and tow, carried well above the eaves gutter, and surmounted by a galvanised wire dome to prevent leaves or other matter from entering to obstruct the air passage. It is a matter of great importance to observe that ventilating

shafts should be constructed perfectly straight, and no bends should be introduced unless absolutely unavoidable, as they tend to prevent the easy passage of the air, the up-drawing of which is induced by the slightest breeze across the mouth of the shaft. Many a ventilating shaft has been rendered worse than useless by the unnecessary number of bends it has been made to contain.

The air inlet shaft shown, connected to the intercepting chamber, is constructed like the outlet shaft with cast-iron pipes, and is carried up against the boundary fence, terminating a few feet above the ground in a mica flap air inlet valve. This valve consists of a small galvanised iron box with a grating in front and a circular opening at the bottom to fit into the socket of the shaft; upon the inside of the grating one or more thin sheets of mica are suspended in such a manner as to completely close up the opening in the event of a rush of gas from the chamber, but to open readily at the slightest puff of wind from without or the suction of air from within the drain.

In Chapter I. it was stated that all drains must be disconnected from the house by means of traps, and in the last article diagrams were given showing the method of doing this in connection with the rain-water pipes and grease gully; but two points of connection remain yet to be dealt with before the drain can be considered complete—viz., that of the soil-pipe and the water-closet apparatus attached thereto, and the outside w.c. adjoining scullery.

Fig. 1 shows in detail a part section and part elevation of the upper portion of the soil-pipe. In this example the soil-pipe is constructed throughout its entire length of 4in. heavy cast-iron socketted galvanised pipes, jointed with lead which has been melted and run into the sockets; the top of the pipe is finished in exactly the same manner as described in the last chapter for ventilating shaft. At the point of intersection with the slates a lead collar is shown soldered to the pipe, and attached to a soaker to prevent the wet getting through and injuring the roof.

A glance at Figs. 1 and 2 will show the method of disconnection by means of the traps attached to the w.c. apparatus. Fig. 2 is a stoneware washdown apparatus of strong manufacture, finished cane colour on the outside and white inside, with the complete trap forming one piece with the basin; it is joined immediately to the drain, which is brought to the surface by an easy bend, and connected to same with cement.

The apparatus shown for the first floor upon Fig. 1 is an "Aquarius" washdown, finished a uniform ivory colour, but in this case the whole of the trap does not form one piece with the basin, but is completed within the cast-iron branch from the soil pipe, the socketted end of which fits into a groove cast in the apparatus, and the joint is completed by pouring in liquid cement until the groove is full.

The feature of this apparatus is the joint, which is always submerged in water; this insures it being left sound when first executed, and enables any defect which might occur subsequently to be readily noticed.

All fittings within the house must be trapped. At first thought this, in the case of appliances whose wastes discharge into trapped gullies, may seem superfluous, but a little consideration will prove otherwise. Every pipe which has to convey greasy or seapy water becomes fouled in a short time by an accumulation upon its inner surface. The atmosphere within the house being usually warmer than that outside, a current of air is induced which passes through the pipe, and bears with it a smell which, if not absolutely dangerous, is at least unpleasant. To prevent such an occurrence, a trap is fixed immediately below the apparatus, and it is advisable as a further precaution to insert a vent at the upper end of the waste-pipe, as shown on Fig. 3.

Fig. 3 is a section through the outer wall of the scullery, showing the sink and its connection with the grease gully. The sink is of stoneware and cane glazed, and the grating is of brass, to the underside of which is connected a drawn lead trap, which has a brass screw plug at bottom to enable the trap to be cleaned if necessary. The waste-pipe is of drawn lead, 2½in. in diameter, and is connected at the floor level to a stoneware bend, which communicates with the gully. This connection is shown in detail in Fig. 4.

The impossibility of making a sound joint between lead and earthenware pipes renders it necessary to provide a third material which shall act as intermediary, and hold readily to either lead or cement; brass or gunmetal has been found to possess both these advantages. Short lengths of brass or gunmetal pipe, known as *thimbles*, are specially manufactured with grooves upon the outside of the lower end, and with the upper edge prepared for contact with lead pipe. Fig. 4 shows the method of forming the joint where the *thimble* is cemented into the socket of the drain pipe, and connected to the lead waste with a plumber's wiped joint.

Plan No. 2 shows the sanitary arrangements upon the first floor. The bath and lavatory basin has each its separate trap, and a screw inspection cap of brass has been inserted near the point where the two waste-pipes are connected before passing into the outside pipe, to facilitate cleaning in the event of a stoppage. The bath is of the type known as "Roman," and is finished to be fixed without top or enclosures. The bath waste-pipe is of drawn lead, 2in. in diameter, and the lavatory waste 1½in., carried along the inside face of wall with a regular fall to the bath waste. In the w.c. the angle at which the soil-pipe branch is fixed is shown by dotted lines, and illustrates a further advantage of the apparatus used, as the branch is cast in one piece with a length of the soil-pipe, and can thus be readily set to any angle horizontally.

THE HEALTH EXHIBITION AT LEEDS.

(Continued from page 169.)

THE Health Exhibition at Leeds has quite realised its opening promises of success. We continue this week the brief notices of the exhibitors' wares we commenced a fortnight ago.

MESSRS. SUMMERSCALES AND SONS.

Laundry machinery needs no apology at a health exhibition, and Messrs. Summerscales and Sons' specialities are well to the front. Complete fittings for public wash-houses are

tion, showing as sanitary engineers, whose work is well-known in the North generally and round Leeds in particular.

THE UNITED ALKALI CO. LTD.

exhibit its chlorine disinfectants, with pamphlet of description.

THE HORSFALL FURNACE SYNDICATE, LIMITED.

This stand contains a small model of the Horsfall Destructor as erected at Hamburg, Edinburgh, and Bradford. The furnaces are placed back to back, and are filled by means of a special self-sealing hopper or platform

which is another exceedingly well-known feature of the Horsfall Furnace. This arrangement brings the gases over the hottest part of the fire before they escape, while at the same time it does not afford any facility for the escape of dust. Instead of having separate steam jets as formerly to each side of each furnace, they have now provided air-ducts, common to all the blast trumpets in the installation, and these are fed with air by steam jet blowers of colossal size. The Company exhibits one of these blowers designed to deliver 176,400 cubic feet of air per hour against a pressure of 2in. of air in the ashpits. This blower is probably the most powerful steam jet apparatus hitherto constructed.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

MODERN SANITATION.

PLAN No 2

Scale of feet.

a particular feature of the firm's manufacture, and leave little to be desired in any respect.

MESSRS. CLAUGHTON BROS.

have a first-rate show of lead castings and sanitary plumbing in general. They also show a special wash-down closet, and a "metallic combination" stair-tread.

THE MAGNETITE SEWAGE AND WATER PURIFICATION CO. LTD.

draw attention to its system, and provide full information and scale drawings of their "Simplicitas" continuous flow automatic sludge-removing precipitation tank.

MESSRS. SLATER AND SONS

assist in the local representation at the Exhibi-

common to both furnaces. The draught is forced in the well-known way peculiar to these furnaces by means of steam jets blowing air into cast-iron sides forming the sides of the furnace for a foot above the grate bars and delivering the air for combustion into the ashpit. The ashpits, of course, are closed—this arrangement has the effect of warming the air for combustion, and also of protecting the sides of the furnace from undermining by the clinker sticking to the brickwork. This feature is further illustrated by a full size cast-iron side made to the order of the Corporation of Ashton-under-Lyne for the triple scheme of refuse destructor, electric lighting, and electric tramways, for which Messrs. Fawcus and Clirehugh are the consulting engineers. A model also shows plainly the front exhaust,

The one exhibited has been made to the order of the Bradford Corporation.

THE PENDLETON SANITARY ENGINEERING CO.

shows Dr. Quine's patent sanitary ashbin, which solves the problem of the backyard in crowded localities by giving every facility for cleanliness and removal from the outside, while economising the yard space.

MESSRS. GARNER AND CO.,

of Smethwick, show Webb's patent reversible window sashes. In this window quite a new departure has been made. The sashes are pivoted, and placed in the frame one immediately over the other in a direct line, and not as with other windows, one behind the other.

This arrangement brings the insides of the stiles of both sashes flush with themselves and with the frame, which enables the employment of hinged and locking flies at the sides of frame, by which the sashes can be made perfectly firm, draught, dust, and burglar proof. The sashes, being loosely hung, can be easily taken out of frame for the removal of furniture, &c., while by the use of special friction pivots, or locking bolts, each sash can be regulated and securely fastened at any required angle for air inlet, or for cleaning, glazing, or painting inside room. It will be seen that this system dispenses with all cords, pulleys, weights, sash fasteners, and beads. All the fittings are simple. There are no loose parts.

MESSRS. RICHARD CLARKE & CO.,

of Heckmonwike, exhibit a new water-pipe, the "Eureka," a combination of an inner tube of pure block tin, an outer case of lead, and an intervening section of asbestos. The pure tin prevents lead poisoning, the water nowhere coming into contact with lead. This pipe, being made in the cold state, is free from all danger of amalgamation of tin and lead, which is formed when tin-lined lead pipes are made in a semi-molten condition. The danger of melting the tin lining when making joints (which occurs with the ordinary tin-lined lead pipe) is entirely obviated by the presence of the non-conducting section, which enables joints to be made as easily and even more quickly than in an ordinary lead pipe. The patentees also claim that the asbestos is a protection against frost, and that by reason of the great strength of the pipe will prevent bursting, being tested to ten times waterworks' pressure.

MESSRS. N. SIMMONS & CO.,

of Bristol, remind the visitor of the summer festivities by their "Diamond Jubilee" improved flushing apparatus, the object of which is to flush, not the closet only, but also, and specially, the soil-pipe itself, right away to the sewer.

THE Wortley Rural District Council is under the necessity of providing new sewerage works for the district of Chapeltown. The Council invited Mr. D. Balfour, an expert, to visit the neighbourhood and to advise, and, in accordance with instructions, Mr. Balfour has prepared three alternative schemes. The three schemes suggested are, first, a scheme for separately treating the sewage of each village in the district by chemical precipitation along with land filtration; second, a scheme for conveying the whole of the sewage by a system of branch and main outfall intercepting sewers to a site near Smithy Wood Colliery; and lastly, a scheme to take in further land adjoining the existing works at Ecclesfield, and Mr. Balfour condemns the first two schemes as impracticable and costly, and recommends the Council to adopt the latter. He estimates the cost at £10,650.

Surveying and Sanitary Notes.

MR. JOHN L. WRIGHT, in an article on "The Chicago Drainage Channel," describes it as "the greatest feat of sanitary engineering in the world." The channel is nothing less than an artificial river, 106ft. wide, cut from Lake Michigan to the Desplaines, a distance of 28 miles. It is intended to carry off the sewage of Chicago by this route, and the rivers Desplaines and Illinois, into the Mississippi. The sewage amounts to 50,000 cubic feet per minute. This is to be swept along by a volume of lake water averaging 300,000 cubic feet per minute. There is a fall of 82ft. from the surface of Lake Michigan to the surface of the Illinois river at Ottawa, 52 miles below the southern end of the canal. This fall means not merely an effective scour, but industrial driving power to the extent of some 80,000 horse-power. The total amount of drift and rock displaced is put at 40,000,000 cubic yards, and the entire cost at 31,000,000 dollars. It is hoped that this will lead to the Government constructing a ship canal from the Illinois river, which will open up a clear waterway for the largest ships from the Mississippi to the lakes via Chicago.

COLONEL A. G. DURNFORD, R.E., one of the Inspectors of the Local Government Board, has held a public inquiry with regard to the proposal of the Ipswich Corporation to borrow £4600 for works of sewerage. The Town Clerk said there was no question as to the need for the proposed works. It was not a matter of approving a new system; it was merely the extension of a system which the Board had approved many years ago, and in respect of which several loans had been allowed. The work of preparing the plans and so forth had been left in the hands of the Borough Surveyor.—Mr. E. Buckham (Borough Surveyor) produced the plans. The gradients were in all cases sufficient, he said, for the working of the sewer; provision was made for flushing manholes and ventilators, and the intercepting sewer was quite competent to take away the additional quantity of sewage.—In reply to the Inspector, the Town Clerk said that in some streets old drains were to be taken up, and new work put in; but these old drains were laid many years ago, and formed no part of the present system, for which loans had already been granted. It was pointed out, amongst other details, that it was proposed to continue the sewer in St. Peter's Street from College Street, where it joined the main line of sewer, to Rose Lane. The streets included with the list for which this amount is borrowed, which will not all be dealt with at once, lie in many parts of the town, including the Californian District, where sewerage has been so urgently called for.

At the recent Congress of the Sanitary Institute an interesting paper was read before the members of the engineering and architectural section by Mr. Edwin T. Hall, on "Fever Hospital Construction." Mr. Hall, who was the architect for the Park Hospital, belonging to the Metropolitan Asylums Board, which is the largest institution of its kind in the United Kingdom, pointed out that all the essential principles of hospital planning were laid down in the memorandum of the Local Government Board, issued in 1888, "On the Provision of Isolation Hospital Accommodation by Local Authorities." They were—(1) thorough isolation of infected buildings; (2) cross currents for thorough ventilation; (3) avoidance of dark corners anywhere; and (4) the necessity of keeping from direct contact with wards, as far as possible, receptacles for excrement. No matter what was the size of the hospital, those principles should be acted upon. The happiest results had followed the decision of the Metropolitan Asylums Board, taken in 1885, to separate smallpox patients, from which the danger was greatest, from other infectious cases, and to establish for smallpox cases floating hospitals on the Thames, at Darent. With regard to sites, an open area, surrounded, if possible, by roads which induced wind currents, on a gentle slope, with good trees near the boundaries, and as compact in shape as possible, would be found the best. In conclusion, Mr. Hall made an appeal for an architectural treatment in all hospitals. He believed, he said, in the artistic treatment of wards as being of a refining as well as a curative value to patients.

MR. G. W. WILCOCKS, M.Inst., C.E., an Inspector of the Local Government Board, has held an inquiry into an application made by the Rotherham Town Council for sanction to borrow £55,269 for the purposes of sewerage and sewage disposal. In his statement the Town Clerk said the Corporation had decided to have constructed sewage disposal works, and had visited a large number of the best schemes in the country, ultimately coming to the conclusion that the one in operation at Wolverhampton was the best adapted for the Rotherham district. The Council therefore engaged Mr. R. E. W. Berrington, the Wolverhampton engineer, whose plans and scheme it had adopted. A contract had been entered into for the purchase of 90a. 1r. 2p. of freehold land for £18,052 10s., as a site for the proposed works. Mr. Berrington produced plans and gave detailed particulars of the scheme. The sewage after being collected and carried to the outfall works would pass into tanks, the effluent going through two series of coal filters, and afterwards passing on to land, finally finding its way in a satisfactory condition as to purity into the river. The sludge would be treated and pressed, being available for farmers' use.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
Oct. 15	Bletchingley—Workhouse Alterations	Godstone Union	T. Eliff, Caterham, Surrey.
" 15	Redruth—Stone Fencing, &c.		H. W. Collins, Architect, Penryn-street, Redruth.
" 15	Birstall, Yorks.—Boys' Cloakroom	Brownhill National Schools	Holtom and Fox, Architects, Westgate, Dewsbury.
" 15	Devonport—Residence, &c.	A. J. Rider	R. H. B. Neal, Architect, Central Exchange, Plymouth.
" 15	Rathdrum, Ireland—Labourer's Cottage	Guardians	— Little, C.E., Rathdrum.
" 16	Buckfastleigh, Devon—Alterations, &c. (Two Contracts)	J. Fleming	Torr Dean Farm, and Bigdon Stables, Buckfastleigh.
" 16	Callan, Ireland—Fifty-eight Cottages	Guardians	J. F. Shelly, Clerk, Board-room, Callan.
" 16	Spalding—Three Small Houses	R. W. Walden	R. H. Holmes Hand, 6, Double-street, Spalding.
" 16	Silsden—Twelve Houses	Co-operative Society	R. P. Holdsworth, 1, St. John-street, Silsden.
" 18	Bradford—Nineteen Houses		Milnes and France, Architects, Bradford.
" 18	London, W.—Enlarging Nurses' Home	St. Marylebone Guilds	A. S. Snell, 22, Southampton-buildings, Chancery-lane, W.C.
" 18	Croydon—Boundary Wall	Union Guardians	T. West, 23, Coombe-road, Croydon.
" 19	Alnwick—Additions		E. R. Temperley, Clerk of Works, Alnwick Castle.
" 20	Coventry—School Additions	School Board	G. and J. Steane, 22, Little Park-street, Coventry.
" 20	Leeds—Walling, &c.		City Engineer, Municipal-buildings, Leeds.
" 20	Morley, Yorks.—Public Baths	Corporation	Holtom and Fox, Architects, Westgate, Dewsbury.
" 20	Morecambe—Concert Pavilion	Pier Company	E. Hill, Secretary, Morecambe.
" 21	Belfast—City Hall	Corporation	E. Thomas and Son, 7, Queen Anne's-gate, S.W.
" 21	Kingston-on-Thames—Hospital Buildings		Town Clerk, Clatterton House, Kingston-on-Thames.
" 22	Eastbourne—Lodging-house	Sanitary Committee	W. C. Field, Borough Architect, Town Hall, Eastbourne.
" 22	Elgin—Buildings		J. Innes, 86, Gordon-street, Huntley.
" 22	Lowestoft—Batteries, Drill Shed, &c.	Admiralty	Director of Works Department, Admiralty.
" 22	West Mersea, Essex—School Alterations	School Board	J. W. Start, Architect, Colchester.

COMPLETE LIST OF CONTRACTS OPEN—continued.

THE ARCHITECTURAL ASSOCIATION.

PRESIDENTIAL ADDRESS.

THE Architectural Association commenced the Session 1897-98 last week. The annual general meeting was held on Friday night at 9, Conduit Street, and, after the presentation of prizes—a list of winners will appear in our next issue—the President, Mr. Hampden W. Pratt, delivered his inaugural address. He said: There are certain periods in the history of an institution when it is convenient and customary, not to say interesting and instructive, to look back and trace the course of events—in other words, to review the past; also to consider the present, and look forward to the future. For fifty years the Architectural Association has striven to supply the needs and promote the welfare of the architectural student, and it must be very gratifying to the founders of the Society, a few of whom happily survive, to look upon the flourishing body that still bears the name of the Architectural Association. The object of establishing the Association was “to enable young men who are studying Architecture to meet for general improvement in the various branches of their Art.” In a circular issued at the origination of the Society it was pointed out that “the great advantages a scheme like this, if carried out, would offer to the architectural student, must be obvious at a glance. By this institution all the future members of the Profession, their objects, their labours, their studies, would become known to each other. The incalculable advantages this knowledge and acquaintance would afford to those engaged in the same study; the mutual instruction and valuable assistance each could afford, the

HONOURABLE SPIRIT OF EMULATION

that would be engendered; the furtherance of their Art in general, and the happy effect that must be produced by all the future architects becoming a band of friends, intimately associated with each other in their plans and projects, must and will prove of the greatest advantage to all those connected with the scheme.” This forecast has been fulfilled to the letter, and we may truly say that the bonds which unite us to-day are as strong and as powerful as ever they were, and no one but a Hercules could sever or destroy them. There is scarcely anything recorded of the early years of the Association, its proceedings were not reported as they now are, and it is mainly through the unpublished minutes of its meetings that we are able to glean something of its history. As we turn over the pages of its log-book we may note the chief incidents of the voyage, and trace its progress from year to year. The question of public competitions seems to have been early considered, for in 1850 a code of regulations was drawn up and issued; this interesting document was published in the jubilee number of “Architectural Association Notes,” and contained some excellent suggestions which

THE AGITATION OF MANY YEARS

has not succeeded in satisfactorily settling. As evidence of a desire to enlarge its scope, we find that Mr. R. Kerr, 1852, laid before the Committee a scheme for the formation of an Architectural Academy, comprising courses of study, professorships, lectures, graduation, &c., and a resolution was passed to the effect that “the proposition is well worthy the consideration of the Profession generally, and that any assistance toward the furtherance of this object that can be rendered by the Association shall be liberally given.” Unfortunately, financial troubles proved a stumbling-block to the smooth working of the Society, chiefly owing to the members getting into arrears with their subscriptions—an experience not confined, by the way, to the infancy and youth of the Association, as subsequent treasurers can testify; but at the outset it was a serious matter and led to the appointment of a Committee of Investigation in 1855. This Committee reported that they “found the Association in a state of apathy, torpor, and depression unparalleled in former sessions”

the financial statements had been misleading owing to the

CONCEALMENT OF HEAVY LIABILITIES,

and the management of the Society called for improvement. It was further suggested that a lending library should be formed, and an “Architectural Association Magazine” might, if published, be expected to pay its own expenses. The report concluded with an earnest appeal for a renewal of the enthusiasm which characterised the members at the formation of the Society. Following closely upon the reception of this report came a proposal to memorialise the Institute “for the establishment of an examination which should eventually serve as the basis for the issue of such a diploma as shall certify that the holder thereof is fully qualified to practice as an architect.” A reply was received from the Institute in 1856 to the effect that the Council felt it was premature to pronounce an opinion upon so important a subject, and that before they could recommend the Institute to undertake such a charge it would be necessary to ascertain the opinion of the Profession generally, at the same time they would be able to come to a sounder judgment after some experience of the District Surveyors’ Examination recently instituted. Disappointment followed this decision, interest in the Society continued to flag, and in May, 1856, a special meeting was held, at which a resolution was brought forward to

TERMINATE THE EXISTENCE OF THE ASSOCIATION;

this, however, was defeated by a large majority, thus indicating that there was at any rate some vitality amongst the members. In the following month, an important letter was received from the Institute suggesting an amalgamation of the Association with that body. This communication was duly considered, and a resolution passed to the effect that it is not expedient for the Association to join the Institute on the terms suggested. The crisis through which the Association passed in 1856 was followed by an awakening interest in its welfare, and a committee was appointed to take into consideration the defective means of architectural education and the desirability of forming classes for the special study of subjects immediately connected with professional practice. In January, 1857, a *conversazione* was held, at which Mr. Ruskin was present and read a paper on “The Use of Imagination in Modern Architectural Design,” and though forty years have passed since then it is interesting to recall and record some of the words of a master in Art who in times past has kindled so much enthusiasm in the architectural breast. Mr. Ruskin said: “If they were asked abruptly, and required to answer shortly, what were the qualities which distinguished great artists from mean artists, he believed they might reply—first, their imagination; second, their industry. Some of them might doubt the justice or the necessity of attaching so much importance to this latter quality, because there might be dull men who were industrious, and clever men who were indolent; but though the industrious man might be dull, and the indolent man might be clever, he had never known a great man who was not industrious. But though this quality of industry was essential to an artist, it

DID NOT MAKE AN ARTIST;

for many people were always busy whose doings are of little worth. Neither did feeling make the artist; but the gift which distinctively made the artist—without which he would be feeble in life and forgotten in death—was that of imagination. Imagination was not manipulation, or calculation, or attention; it was something more, something higher than all or any of these. If an architect lays his bricks and stones well, we praise him for his manipulation; if he keeps well within his contract, we praise him for his calculation; and if he arranges his beams so that nobody drops through his floors, we praise him for his caution. But, if he is to be a great architect, he must do something more than possess and exercise these qualities.” After referring with

regret to the separation between sculpture and Architecture in modern times and to the field opened to the fancy by the junction of sculpture with Architecture, he remarked that “nearly every other Art was limited in its space; but was there anything within the range of sight, or thought, or conception, which might not be of use to the architect, or in which an interest might not be awakened to the advantage of his Art?” Concluding an eloquent address, Mr. Ruskin said, “So soon as they desired to build largely, they would find that their work must be associative; one could not

CARVE A WHOLE CATHEDRAL

himself, either their own work must be disgraced, or they must raise their fellow-designers to some correspondence of power. They would take the lead in disposing of their building, but they must trust to the genius and invention of others in the disposal of its detail; and in doing this, too, they must rejoice in the very powers that may promise to rival them. If they endeavoured to depress or disguise the talents of their subordinates, they were lost to their Art, for it was their own prosperity they were seeking, and their own skill that they were striving to perpetuate. He placed no utopian standard before them; he had said that they must surrender their own pre-eminence to their love of building, and whomsoever they found better able to do what would adorn it than they were, that person they were to give place to, and rejoice at seeing their edifice growing more beautiful under his chisel, and next rejoicing that they had done kindly. The man who sees capacity in another, and does not acknowledge it, or assist in bringing it forth, is not the refuser of a kindness, but the committer of an injury. They had the sweet consciousness that as their Art embraced a wider field than all others, so it was more profound and holy than all others. The artist, when his pupil is perfect, must see him leave his room that he may pursue his destiny perhaps as an opponent in toil; but architects alone were called by kindness to fraternity of toil. Those massive piles which rise above the

DOMESTIC ROOFS OF OUR ANCIENT CITIES

have a meaning more profound and true than is commonly attached to them. Men say they are good for worship—but so is every mountain, glen, and rough sea shore; they have the indisputable and distinguished glory that their mighty walls were raised by men who have given aid to each other in their weakness, and the strength of their structure has its foundations on manly friendship, which conduces to awaken the sweeter cadences and symmetry of the human soul.” What effect Mr. Ruskin’s eloquent address had on the members is not recorded, but it is pleasing to find that the Committee were able at the commencement of the next session to congratulate the members on the general improvement which had taken place in the prospects and financial position of the Association, which was at length freed from its embarrassments, a fund having been raised for the purpose. A movement was on foot at this period to provide a home for the architectural bodies in London; the Architectural Union Company had been formed, and was erecting a building in Conduit Street, and after prolonged negotiations, the Association arranged terms, and removed from Lyon’s Inn Hall, holding its first meeting at 9, Conduit Street, on April 1st, 1859. In that year, for the first time, a prize was awarded in the class of design, and a prize essay instituted, the subject being “Street Architecture and its proper treatment.” The

ACQUISITION OF NEW PREMISES

might have been expected to mark a renewal of vigour in the work of the Association, but, strange to say, only twelve months had elapsed when a resolution was passed regretting the want of support afforded by the members, and asking the Committee to consider and report whether there was any course short of closing its operations. The Committee recommended that all office bearers, with the exception of three, should for the next session be members who had never held office before; accordingly

some new blood was introduced into the direction of affairs. A circular having been issued by the R.I.B.A., inviting suggestions on the establishment of a voluntary examination, the Association held two meetings at the close of 1860, and after fully discussing the matter passed two resolutions: 1. "That in the opinion of the Architectural Association a strictly voluntary examination should be instituted with a view of guiding the student in architecture to such a course of study as would enable him to arrive at

COMPETENCE IN HIS PROFESSION."

2. "That in the event of a professional examination being insisted upon, it should be limited to those subjects which bear directly upon the practice of the Profession, and this Association is apprehensive that any examination upon the principles of taste might lead to results unfavourable to the progress of Art." In 1860 botany and modelling classes were formed, the latter proving very successful. In 1862 the library, which had been in course of formation for some time, was at length opened. In the same year Saturday afternoon visits were organised, the first being to Westminster Abbey, a prize being given for the best account of the visit. At the conversation in October, 1862, a musical programme was introduced for the first time, the services of the artists being gratuitous. In 1863 the voluntary examination class was established for the study of practical subjects, with special reference to the examination then instituted, the Association having pledged itself to use all its influence to induce the members to qualify themselves for it. In the following year a class for the study of figure-drawing was formed, under the direction of Mr. E. J. Poynter, and was so attractive that fifty members joined it. A water colour class was subsequently started. In 1867 the A.A. Sketch Book was commenced, the parts being issued monthly at a subscription of one guinea per annum, as now, and an excellent publication it has always been. At this time the Class of Construction was formed to carry on the work formerly undertaken by the Voluntary Examination Class; and a year later the Elementary Class of Design was started. The Association had now

SETTLED DOWN TO STEADY WORK,

for in Session 1868-69 a number of sub-committees were appointed and a balance sheet published for the first time, showing an income of about £240 and a substantial sum in hand; it became necessary, also, to compile a catalogue of the library, and this was issued in 1869. We next come to an important report drawn up in 1869 by a Joint Committee of the Institute, the Academy, the Architectural Museum, the Association, and the Architectural Exhibition, on the question of establishing a "School of Art accessorial to Architecture." This Committee carefully investigated the scheme of the voluntary examination, and arrived at the conclusion that its failure was due to: 1. The absence of a formal certificate of having passed the examination. 2. The want of such a stimulus or pressure as would make the passing of the examination professionally necessary. 3. Inefficient preliminary education. 4. Want of system in architectural education. They accordingly recommended: 1. That a text-book or pamphlet should be prepared, containing a complete curriculum of study for the architectural student. 2. That a certificate be granted to all who pass the voluntary examination. 3. That at some future period the membership of the Institute be made dependent on the passing of the voluntary examination in the Class of Proficiency. 4. That a preliminary examination be held in elementary subjects open to all students who have been at least one year in an architect's office. 5. That

THE INSTITUTE SHOULD ASSIST THE ASSOCIATION

to carry out the proposed Drawing School. 6. That a Committee be appointed to compile the text-book referred to. As a result of the fifth recommendation Architectural Art Classes were established at the Architectural Museum under the management of a Com-

mittee composed of representatives of the Institute, the Museum, and the Association. These classes were commenced in 1870, and comprised figure drawing and architectural ornament, the latter being conducted by well known architects as visitors. For two years the Association contributed £25 annually towards the expenses of these classes, which, however, soon languished. The first annual excursion took place in 1870, when Lincoln and district were visited, the party being conducted by the late Mr. Edmund Sharpe; and it may be remarked here that every year since then some fresh district has been visited. During the next ten years (1870-80) no important change or event took place, the membership grew from 500 to 800, two new classes were formed, viz., for the study of colour decoration and architectural science, the latter being subsequently called the Advanced Class of Construction; some courses of lectures were also delivered; special arrangements were introduced

FOR THE BENEFIT OF COUNTRY MEMBERS

in connection with the classes and library, and the Birmingham Architectural Association was admitted as a provincial branch. The Institute opened its Library to members of the Association under twenty-three years of age. New and amplified rules were adopted in 1877, and four years later the entrance fee was raised to one guinea. Additional rooms were taken at Conduit Street in 1879; the Architectural Association medal was founded in that year and the Architectural Association Travelling Studentship two years after, when a sum of nearly £700 was subscribed by past and present members to provide the necessary funds. In 1881-82 the Committee thought it desirable to vary somewhat the arrangement of the classes, with a view to making them specially useful to members preparing for the new obligatory examination of the Institute, which commenced in 1882. Courses of lectures on the history of Architecture and on Construction was given, and a new class started for the study of planning and specification writing. In 1884 a Special Education Committee was appointed to enquire thoroughly into the general organisation of the Association, with a view to further systematise its working and extend its usefulness, and a scheme was adopted, in 1885, for amending and consolidating the work. The main feature consisted in forming

TWO DEFINED DIVISIONS OF STUDY,

called the elementary and the advanced, the former comprising elementary classes of design and construction, preceded by lectures on history and construction, and the latter consisting of classes of design, colour decoration, advanced construction, quantities and surveying, but no lectures. The work was conducted by visitors, who were formed into a Committee of Advice. An attempt was made at this time to increase the subscription of members to one guinea, with the object of affording increased educational advantages, but the proposal was defeated by a small majority. In 1885, the Saturday vacation visits were first organized, and in the ensuing session many improvements were effected in the library, viz., a new system of registration, the addition of a reading room, and the opening of the library twice a week instead of once. In 1886-87, a practical class of masonry was carried on as an experiment at the City and Guilds Institution, and a series of lectures started on Graphic Statics. A noteworthy step was the issue in April, 1887, of the first number of A. A. Notes at a small subscription, the desirability of providing a means of intercommunication amongst the members being at length realised, though it was not until four years later, when it was issued free to all members, that its purpose was more completely fulfilled. The gradual

INCREASE IN THE NUMBER OF MEMBERS

and the large attendance at the ordinary meetings forced the Committee to consider the necessity of providing better accommodation, and by the kindness of the Institute we were permitted to hold our meetings in their room during session 1887-88, a privilege which has

been courteously extended to us ever since. About this time rules were passed to facilitate a scheme of affiliation, with the desire of creating a bond of union between the Association and provincial Societies; the Birmingham and Glasgow Associations joined us, but the arrangement did not long exist. An elementary class of ornament and colour decoration now appeared and was well taken up, and two years later the sketching and measuring class was formed for the purpose of visiting buildings in the neighbourhood of London during the summer. At the same time an A.A. Cycling Club was organised with the object of making runs to places of architectural interest, but this club soon disappeared, and, notwithstanding the growing popularity of cycling, no attempt has been made to restart the club. Another club was founded in 1888, viz., the Lyric Club, one of the objects being to promote friendly intercourse among the members; and those who appreciate the social advantages of music, dancing, and smoking are still provided for at this club. Reference may be made here to the Camera Club, though founded at a later date (1893). Apparently, this club is not so prosperous as it was at first, and a hope may be expressed here that some effort will be made to revive its usefulness. We have now arrived at

THE LAST GREAT MOVEMENT

in the Association. In 1889 a Special Committee on Education was appointed, and after exhaustive enquiries its recommendations were approved by the general body in May, 1890. Following this, a special committee was appointed to consider the revision of the rules, a new constitution and bye-laws being adopted by the general body in the following January. These included the raising of the entrance fee to two guineas and the subscription to one guinea, to all members elected after 1890; and also provided for the appointment of paid officials. A re-organisation committee was next appointed to prepare the new education scheme and resulted in the new curriculum. In order to establish the new scheme and provide for the extra cost and risk incidental thereto, as well as the outlay involved in obtaining suitable premises, an appeal was issued and generously responded to by members of the Profession. The scheme provided for a complete course of study extending over four years, that being considered as the least time that should be given to the study of the subjects. It was laid down that the

AIM OF THE COURSES

was to help members to fit themselves for their work as architects, by providing the means by which they may supplement the training acquired in offices; the principal object not being to prepare candidates for the examinations, although the courses were chiefly based upon the programme of the examinations. Premises having been secured in Great Marlborough Street and adapted to meet our requirements, the new scheme was launched in 1891-92. From the outset the first and second years' courses were well supported, the third being thinly attended, and the fourth not fully started. In 1892-93, Divisions I. and II. continued to be well supported, and Divisions III. and IV. showed improvement. In 1893-94 there was a poor attendance in Divisions III. and IV., indicating the necessity of re-arranging these Divisions. In 1894-95 the complete course was arranged in three divisions, but the attendance in Division III. was again disappointing, and a special committee was appointed to enquire into the working of the classes. As an outcome of this enquiry the Institute agreed to alter the dates of the examinations so as to avoid interference with the working of the classes. In 1895-96 the curriculum was arranged in two divisions, the complete course extending over four years, and a School of Design started, being attended with considerable success. Last session the work of the classes and studio showed a continued improvement, especially in Division I. The School of Design and Handicraft was most successful, and the whole session was devoted to one subject with good results.

(To be continued.)

Professional Items.

ABERDEEN.—The Plans Committee of the Town Council reports having sanctioned the plans of the following new buildings:—Two dwelling-houses on the south side of Hilton Street, for Mr. George Mackie, surveyor; Woodside; two dwelling-houses on the north-east side of Cranford Road, for Mr. William Anderson, builder, per Messrs. Davidson and Watt, architects; dwelling-house, offices, and shop, on the west side of Belmont Street, for the City Property Association of Aberdeen, per Messrs. Walker and Duncan, architects (amended plan); alterations at No. 53 and 55, St. Nicholas Street, per Messrs. Brown and Watt, architects (amended plan); four dwelling-houses on the west side of Clifton Road, three of the houses being for Mr. Joseph Shirras, builder, and one for Mr. Thomas Philip; additions to cottage at Clayhills, for Mr. John Chisholm, carting contractor, per Mr. Duncan Hodge, architect (amended plan); five dwelling-houses on the west side of new street off Urquhart Road, for Mr. William Bremner, per Messrs. Walker and Ross, builders; two dwelling-houses on the west side of the proposed new street at Angusfield, for the Rubislaw Granite Company, per Mr. R. G. Wilson, architect; four dwelling-houses on the north-east side of Whitehall Road, for Mr. Alexander Young, house proprietor; two dwelling-houses on the north-west side of Walker Road, Torry, for Mr. John McGregor, builder; shed on the west side of Broomhill Road, for Mr. James Farquhar, builder (amended plan); stables and van sheds at Millbank, Berryden Road, for the Northern Co-operative Company, Limited, per Mr. Alexander Mavor, architect; dwelling-house on the west side of Holburn Street, per Mr. Duncan Hodge, architect; alterations and additions in connection with the property, No. 76, Bon-Accord Street; two dwelling-houses on the north side of Union Grove, for Mr. James Park, builder, per Mr. John Cameron, builder; two dwelling-houses on the north side of Union Grove, for Mr. James Fyfe, contractor, per Mr. John Cameron, builder.

BIRMINGHAM.—The finest stained-glass window erected in St. Philip's Church, in memory of the late Bishop Bowlby was dedicated a week ago. The interior of the fine old church—"the pride of the place," Hutton called it—is certainly enriched by this latest addition to its beauties. From the design of Sir Edward Burne-Jones, and constructed by the well-known firm of Messrs. Morris and Co., the window is a magnificent work of Art. It overlooks the baptistery at the west end of the church, immediately facing the much-admired Burne-Jones window in the chancel. The design represents Christ sitting in judgment surrounded by angels, carrying vials of destruction. Immediately beneath is an angel blowing a trumpet, with a city in ruins, and waiting below a crowd of people, with upturned, expectant faces, on which there is a look of awe-struck suspense. The whole work has been admirably conceived, and carried out with a truth and an attention to detail which will win for it the admiration of all who see it. The whole of the figures are life-size. The prevailing colour is a rich, deep ruby-red, diversified with the delicate half-tones of which Burne-Jones is so fond.

BRADFORD.—The new chapel which is Mr. Walter Morrison's gift to Giggleswick School, and of which the memorial-stone was laid last Thursday, occupies an imposing site on a knoll of millstone grit that rises steeply above the school buildings. Owing to its position, it will be a conspicuous object from the surrounding country in nearly every direction. The plan, which is unusual, consists of a Latin cross, with a dome over the crossing, surrounded at the four angles by turrets, which are crowned by small cupolas. The choir is placed under the dome, and the shallow transepts contain each a gallery, that in the north transept being intended for the organ. The school will occupy the nave, which is lit by a

lofty clerestory, and has a narrow and low aisle on each side for access to the pews. The materials will be chiefly the local stone of various kinds, including a black limestone, which will be used in bands or chequers with the lighter coloured masonry. The dome will be of concrete, with a wooden covering, laid with sheet copper, and it is to be surmounted by a stone lantern and a cross of gilded metal, resembling those on Oriental churches. The principal dimensions are:—Length, 101ft.; breadth of transept, 54ft.; of nave, 46ft.; height of dome above the floor of nave, 85ft.; and above the vestry floor, 92ft. The plan shows seats for 344, with a good deal of free space. The architect is Mr. T. G. Jackson, R.A., and the work is being carried out under his direction, without a contractor, by Mr. Evans, his clerk of works. The chapel will be heated with hot air by Messrs. Haden, of Trowbridge.

DUNDEE.—The notable block of buildings which has been erected in Albert Square, Dundee, by the Prudential Assurance Company Limited, is now all but completed. The greater part of the structure has been let and occupied for several months, but the chambers of the Company, from the lavish nature of their equipment and decoration, are only now emerging from the hands of the contractors. The building will rank as one of the architectural features of Dundee, and it goes a long way in enhancing the appearance of the best built quarter of the city. Prepared in the offices of Messrs. A. Waterhouse and Son, New Cavendish Street, London, the designs have combined the most modern ideas with a refined artistic taste, and the result, as seen in the finished structure, is a building which up to the present time is unique in the Architecture of Dundee. The building is four stories in height, with sunk mezzanine floors, and the design is handsome and elegant. The material used in its construction is red Dumfriesshire stone mixed with terra-cotta bricks, while Peterhead granite has been freely employed with excellent effect upon the ground floor. On the left is the main entrance, leading to the principal staircase, which gives access to the upper floors. Entering by a handsome carved oak door with ornamental hinges, one finds himself in the porch, from which, on the right, swing doors lead into the vestibule, and thence through other swing doors into the general offices of the Prudential Company, while ahead it passes into a vaulted corridor leading to the staircase and the sunk floor. The general office is lofty and spacious, and is lighted by large windows in Albert Square and McIntosh's Close. The walls have been treated in faience—a finely tinted glazed tile—which beginning at top with a blue-green cornice and frieze passes through deepening shades of yellow and brown, until on the floor level it has become a chocolate colour. Two large fireplaces with elegant overmantels, also carried out in faience work, are prominent features of the room. The design of the ceiling is hexagonal, and decorated in light tints to correspond with the colours of the walls. The floor on the public side of the counter is of mosaic laid by Italian workmen, as is also the floor in the vestibule, porch and corridor. In immediate connection with it are the manager's and assistant manager's rooms, separated from each other by walnut screens. The decoration of both is similar in style to that of the large office, and there cannot be the slightest doubt that these three chambers form the most artistic suite of offices in the city. The vestibule and porch are also treated in faience, while the dado of the corridor is of the same material. The corridor is lighted at the far end by a lantern, beneath which is a pretty little alcove for the accommodation of plants or statuary. Ascending the main staircase, the first stop is the mezzanine floor. The first and second floors are let as offices of two and three rooms, all the apartments being finely proportioned, well lighted, and provided with every convenience, while the top flat is set apart for the caretaker and for store rooms and other purposes. Many of the details of construction are new to Dundee, and must readily be recognised as improvements upon

former methods. The fireproof safes, for instance, are constructed in the walls of the corridors, one being provided for every large office. The sanitary accommodation is of the most approved type. Each flat has its range of lavatories, with tiled walls and mosaic floors. By the adoption of Boyd Wilson's fire-resisting floors, the danger from fire is reduced to a minimum. The lighting is done by about 130 incandescent electric lamps of 16-candle power each, introduced on the new interim-conduit system; and the heating is provided by fireplaces in every room. The stair wall is entirely lined with cream-coloured tiles. The contractors for the work were as follows:—builders, D. and A. Powrie; joiners, John F. Shaw and Son; plumbers, William Mitchell and Son; plasterer, James Laburn; slaters, Ramsay and Reid; painters, P. and A. Davie; electric light installation, bells, telephone, and window blinds, J. Pullar and Co.; faience work, Burmantofts and Co. Ltd., Leeds; mosaic work, Ebner and Co., London. Mr. T. M. Ponton has discharged the duties of Clerk of Works.

GLASGOW.—Messrs. Doulton and Company, of London, have just completed some very extensive alterations on the sanitary fittings of the Central Station Hotel, Glasgow, for the Caledonian Railway Company. These include the entire reconstruction of the entresol floor lavatories and the restaurant lavatories. They have also constructed on the entresol floor a new ladies' cloak-room and lavatory. The floor, walls, and ceiling are tiled with the firm's patent key-back tiles, the roof being panelled, and the floor in mosaic. The closet rooms are finished entirely in dark, fumed mahogany, highly polished, while the divisions are of marble, the lower section being of Bardillo marble, and the upper section of white veined marble. The closets are of Messrs. Doulton's well-known "Simplicitus" type, the cisterns being encased in mahogany. One very noticeable feature about these is the entire absence of noise when flushing, a desideratum brought about by a simple but most ingenious arrangement. The lavatory basins, which are the firm's "Waverley" pattern, are finished in rouge royal marble, and the hot and cold supply valves are on their self-closing principle.

LEICESTER.—The opening of the new school in the Newarke, built by the Corporation for the carrying on of technical and Art teaching in Leicester, took place a week ago. The building has a frontage of 215ft., and is four storeys high. The Architecture of the building is treated in a free Renaissance style, the general character being influenced by the large windows which are requisite for teaching the various subjects, especially those of drawing and modelling. The materials for the facing are Ellistown pressed bricks, with Portland stone dressings, the roof being covered with Westmoreland slates. The general construction of the work is of the soundest description, fire-resisting materials having been used for the whole of the corridors and staircases; also the three lower floors. The lower ground floor is chiefly given up to the staple trades of the town. On the ground floor are arranged two lecture rooms and four classrooms, which are available for the teaching of technical, commercial, and science subjects. It may be mentioned that the corridors leading to the various class-rooms and workshops have been made wide enough to facilitate their being used for the purpose of exhibiting objects in connection with the various subjects taught. The two upper floors are devoted to the teaching of Art, the first floor to elementary subjects, and the second to the advanced. The elementary shading-room is a spacious apartment placed in the centre of the building. There is also provided a spacious room for teaching architecture and building construction. At the south angle is placed the Art lecture-room; the floor of this gradually rises in order to give every student an unobstructed view of the models or lecturer's blackboard. At the north-west end of the building there are three rooms arranged for the modelling department, all of which have glazed brick dados 5ft. high. The second

floor contains the antique room which occupies the centre position, and is divided into three divisions by screens with curtains over same, each space having a large single window well above the floor. A spacious painting-room, also divided into three divisions, is provided, and rooms for needlework classes, and carving. A short flight of stairs gives access to a conservatory placed at the top of the building. This will be found a useful adjunct to the School of Art for the purposes of drawing from plant forms, which will be a great aid to design. Nearly the whole of the fittings of this building have been specially designed by the architects, the contracts for these having been chiefly carried out by Messrs. T. and H. Herbert, and Messrs. J. C. Kellett and Son. The electric and gas lighting has been carried out by the Corporation, under the able supervision of Mr. A. Colson. The heating and ventilation of the building has been carried out by Messrs. Ashwell and Nesbit on the "Plenum" system.

LOUGHREA.—The foundation-stone of the new cathedral at Loughrea was laid last Sunday. The new cathedral will be one of the best equipped churches in Ireland. The plans were prepared by Mr. Byrne, architect, 20, Suffolk Street, Dublin, and are, in the opinion of experts, exquisite in design, and well suited to all the requirements of a cathedral church. £20,000 is needed to build the church.

MIDDLEWICH.—On Saturday week at Middlewich, the foundation-stones of new technical schools and a free library were laid. The building, which occupies a site presented to the town by Sir John Brunner, is admirably designed, and is intended to commemorate the Jubilee. Provision is made for the teaching of chemistry, science and Art subjects, shorthand, wood carving, typewriting, cookery, dressmaking, &c., while a well-appointed library and reading-room will be provided.

PLYMOUTH.—A new colossal statue of our Lord, which was to stand within a richly carved niche of St. Peter's Church, has come to grief. The new work has been designed, thoroughly in keeping with its immediate surroundings, by Mr. Geo. Fellowes-Prynne, and during the past week members of the staff of Messrs. Harry Hems and Sons, of Longbrook Street, Exeter, in whose studios the sculpture and its accessories were carried out, have been engaged in its erection. On opening the large case containing the statue, it was found that in transit over the railway it had come to hopeless grief, being broken in twain, the damage being quite past remedy. A new statue—a replica—will have to be made, representing a labour and serious delay of several months. The damaged statue was a powerful example of the sculptor's craft. It represented a figure of our Lord, some 8ft. high, carved, like the niche, &c., in finely grained Caen stone, from the far-famed quarries in Normandy.

RATHMINES.—The Church of Holy Trinity, Rathmines, has recently undergone considerable structural alterations and improvements. The mural decorations of the chancel, which have been executed by Mr. Clarke, of 33, North Great George Street, are treated in decorative ashlar, with deep frieze and string-coursing borders, of bold and effective design. The lower portions of the walls are done in decorative arcading in rich colour to correspond with marble reredos. The panels of the arcades are treated in a conventional style of imitation drapery, which has a very pleasing effect, and harmonises with the surrounding work. The dado is done in a deep shade of bronze green, surmounted with a bold and effective castellated border on an old gold colour ground. The ceiling is in panels, filled with a rich floral design, on a cream-colour ground, having medallions with emblems and monograms in the centre of each panel. The mouldings are picked out in rich colours and gold. The marble panelling which traverses the chancel at the rear of the communion table has been carried out in the early pointed Gothic style. The bottom plinth is of St. Anne's marble, the base course on same being

of "Rouge Rozal" richly moulded. On this sits a range of panelling, the styles or framing being of Sicilian marble, tinted a Sienna colour, and the spaces are filled with Galway green marble. The string course is of moulded alabaster. The upper stage consists of arcading in alabaster supported on pillars of "Galway green" and "Sienna" marbles alternately with moulded bases and foliated capitals in white Sicilian marble, having a background of "Rouge Jaspe" marble enclosed in a moulded and cusped Sicilian frame; a richly-moulded cornice in alabaster surmounts the whole. It may be noted that the "Rouge Jaspe" panels have been specially selected, and that panels of this material and size have not previously been executed in this country. The erection of the marble work was entrusted to Mr. Smyth, of Great Brunswick Street. The stained glass window in the east has been designed in the fifteenth century English period. The window has a rich pictorial effect without in the least interfering with the brilliancy of the glass, which is so much prized, and which places so high a value on ancient work of this class. The glass used is antique and pot metals from the best makers, and bears evidence of careful selection. Mr. Charles J. Tegart, of the Bank of Ireland, has very generously presented a stained-glass window for the southern transept. The window consists of four lights, 13ft. high, with diamond-shaped tracery above. The lights contain nearly life-sized figures of the Evangelists, in very rich and brilliant colours, the faces especially being masterpieces of the glass-stainer's art. The upper portions of the lights are filled with canopy-work, while in the bases are introduced the emblems of the Evangelists. The artists are Messrs. Mayer and Co., of Munich.

ST. ALBANS.—The foundation stones of the Wesleyan new church have been laid. The design for the new building is that of Messrs. Gordon, Lowther, and Garton, of Bloomfield Street, E.C., and a very useful chapel will be built. Its style will be Gothic of the fifteenth century period, and although some alterations in form will be made, which more properly pertain to the nineteenth century, yet it will have not an inartistic appearance. It is to have a double gable at the end in Marlborough Road, with a tower of considerable height between, and here will be the main entrance into the chapel itself. A schoolroom is to be attached in keeping with the Architecture of the rest of the building, and there are several vestries at the rear. The structure is being built of red brick with stone facings, and is 70ft. in length, and 50ft. wide. Internally there is to be a gallery running along the three sides of the building, and this will accommodate 368 worshippers, whilst on the floor there will be room for 600. At the back of the pulpit there is to be a recess for an organ and the choir. Artificial lighting will be by electricity.

TRURO.—The High School for Girls was recently opened by the Bishop of the Diocese. In appearance, the school is of Elizabethan character, having at the north-east corner a battlemented tower. The windows have mullions and transoms, which, like all the dressings, are of Cornish Mabe granite. The walling is of squared Plymouth limestone. There is little ornamentation; the inscription (Luce-Majistra) in a scroll over the main door, the conventionalised lily or fleur-de-lis, which forms the terminal on each of the stepped gables, and also some panels, are, however, all sculptured in granite. The architect was Mr. E. R. Robson, F.S.A., London. The contract has been carried out by Mr. John Collives, Truro. The granite has been supplied and carving executed by Mr. C. W. Andrew, of Penryn.

The Hungarian Premier has received a Royal letter ordering the erection of monuments to personages who figured prominently in Hungarian history in former times. The completion of the monuments will take several years.

Views and Reviews.

TWO BOOKS ON PRICES.

When technical works have reached their second and third editions there is rarely much for the reviewer to say about them, and this is the case with the two little works, "Estimating" and "Repairs," now before us. They have been known for a great many years, and have become the standard books of reference for pricing in detail, showing not only the cost of each item in a building when completed, but how this is made up, going into such minute details, for instance, as, when pricing a staircase, to take the cost per foot super of the risers and treads, and adding to this for the planing, rounding the edge of treads, the moulding under, glue blocking, bracketing and fixing, carriages and fixing, putting together, and profit. The value of the work is thus at once apparent, and the whole scheme is excellently devised and carried out. Many will say that the allowance for profit is low, being at the rate of ten per cent. throughout, but it is deliberately stated, and must be remembered by all using the books that the prices given are for close competition work in London, and must of course be varied in each case, according to circumstances, especially where local conditions prevail. Both books should be in the hands of everyone who has to do with pricing builders' work, and, taken with the above reservation, should prove of constant service.

"Estimating," third edition, 6s. 6d.; and "Repairs," second edition, 3s. 6d. By George Stephenson. Batsford. 8vo.

MODERN OPERA HOUSES AND THEATRES.—VOL. II.

We have received selections from Vol. II. of "Modern Opera Houses and Theatres," by E. O. Sachs. On reviewing the first volume we expressed our opinion of the general arrangement of the book, and the care and labour expended upon its production. This volume seems to be in every way worthy of the first. Vol. I. was devoted to theatres showing Teutonic influence in their conception, and it was the intention to entirely devote this one to those showing Latin influence. But the author holds that there is little to be learnt from the more recent structures conceived under this influence, so he has divided this volume into two parts; one dealing with examples in France, Italy, Moraco, and Spain, the other dealing with Austria, Germany, Great Britain, Greece, Holland, Roumania, and Switzerland. Attention is drawn in the introduction to the fact that certain Continental countries, in their enthusiasm for a suitable framing for their plays, even go to the extreme of attempting such exact distinctions as the definition of a Palace of Art and a Temple of Art; but the author holds that it appears almost trivial to English eyes when such fine distinctions become the matter of controversy, seeming to consider that the English is a practical race, and that "the practical man is not apt for fine distinctions." When he says that the excessive attention given to such artificial distinctions distracts the architect, and even leads to regrettable technical omissions, we are unable to follow him, and for this reason: that we think such distinctions are not artificial, except to those who understand nothing by them. Neither can we see why the designer, in insisting on the exact shade or nuance of expression which he wishes to convey, should necessarily be distracted thereby from technical necessities. The author asks: "What, for instance, is the value of a well-known Austrian critic's opinion, that the grand 'Hofburg' Theatre at Vienna should be classified as a Temple of Art, when, on the other hand, we have the lamentable fact that the acoustics of the auditorium are defective and the sight-lines unsatisfactory?" The Austrian critic might reply that his opinion had precisely the same value as if these defects did not exist, that they had nothing to do with the case—that a building might be a Temple of Art, as distinct from a Palace of Art, though its

acoustics might be defective or its sight-lines unsatisfactory. That a sonnet might be in the Shakespearian, as distinct from the Italian manner, though it had technical defects of rhythm or metre; that a coat might be cut in the London mode, as distinct from the Parisian, even though it did not fit; and that it is generally more profitable to the critic to call attention to the peculiar characteristics and delicacies of expression in any work of Art—which are apt to be generally overlooked—than to the defects which are palpable to everyone. The principal feature of this volume is the work of Mr. Charles Garnier—the Opera House at Paris and the Casino Theatre at Monte Carlo. The Opera House, as the author remarks, has been so exhaustively dealt with already that there is little information to be added to that already public; so no attempt has been made—most wisely we think—to challenge comparison with “Le Nouvel Opéra de Paris.” We cannot help thinking that, as regards this building, the author has been a little unfortunate in his choice of some of the illustrations. The photographic view of the main façade is taken from a point of view from which the building was never intended to be seen, and which does not show it off to advantage. The two wings and background being entirely blotted out on the photograph, gives the building a shorn and lost effect, which is not happy. The print too, being rather dark, somehow suggests a rather gloomy and sombre effect, which is very far removed from the real character of this building. The geometrical drawing of this front though excellent—with the possible exception of the absence of joint lines—from the point of view of the “practical” man, who wants to measure heights and adapt features and arrangements, is yet, as an artistic representation of a work of Art, hardly up to the level which the general high excellence of the work demands. It would, indeed, be a triumph of draughtsmanship to produce a geometrical drawing which should express the peculiar beauty and *verve* of this building, and we doubt whether anyone but a Frenchman would do it; but it surely might have been possible to have produced a drawing in which the sculpture was not quite so feeble, in which the columns were all the same size, and stood centrally over their bases and under their capitals. We are aware that to draw a row of classic columns with distinction and style is an achievement—perhaps impossible to anyone not brought up to it. The side view and the interior of this building are most admirable; the lower part of the main staircase, not being so familiar to us, is especially welcome. Admirable also are the views of the Casino Theatre at Monte Carlo, and its characteristics, as distinct from an ordinary theatre, well insisted upon. As giving an idea of the scope of this volume, we may mention the Court Opera House at Vienna, and Theatres at Prague, Palermo, Geneva, and Zurich, all of which are dealt with from the point of view of technical excellence. Here we think the author speaks with confidence and knowledge, though we cannot always follow him in his general remarks. On reviewing the first volume, we mentioned our dislike upon finding the letterpress divided into two columns by the illustrations, making it necessary for the eye to jump across from side to side in an irritating manner. We like it no better in this volume, where we find it in the description of the Paris Opera House, though we notice gratefully that in general it has been avoided. But when we have had our little grumble and said our worst, we are still left with a keen sense of admiration for the scope and purpose of this book, and for the manner in which it is being carried through; for the labour involved in the collection of so vast a store of information, and the discrimination shown in its selection. It is to be hoped that every library—it is too much to hope that every architect—may place this truly monumental work on its shelves, where it may be readily accessible to every student.

“Modern Opera Houses and Theatres.” By Edwin O. Sachs, Architect. Volume II. Published by B. T. Batsford, High Holborn, London. 1897.
